"Nothing contributes more to encourage elevation of sentiments in a people than the large and free character of their habitations."—JOHN STUART MILL.

VOL. XXIX.

JANUARY TO JUNE, 1883.

LONDON:

PUBLISHED AT 175 STRAND, W.C.

THE ARCHITECT

A JOURNAL OF ART, CIVIL ENGINEERING, AND BUILDING

THE NEW YEAR.

ANOTHER year opens upon England in continued health and wealth. The solid prosperity that comes of peaceful trade, and certainly does not come of all the glories of martial strife, still prevails, and still extends in every direction. The mere surplus riches of Great Britain, the crumbs that fall from the table, are told in figures which transcend realisation. The yearly increase of British property at home, in machines, in ships, in railways, in rolling stock, in public works, in buildings, to say nothing of the incalculable value represented by the appliances of domestic convenience and personal comfort and delight, or of the equally vast accumulation of capital invested well or ill all over the globe, even figures fail to suggest. From the foundation of the world, commerce has been the highway to happiness, and although many a short cut has been tried, every one has been tried in vain.

None the less clearly does history demonstrate the proposition which transcendentalists have always been so anxious that we should regard as a sordid one and base, but which sober experience has with continued persistency nevertheless insisted upon, if only as a mystery—that commerce is the truest patron of art and science. War has many a time carried off the spoils of grace and wisdom, but it has never created them. Peace alone has brought prosperity.

It is the condition of prosperous peace in which England has for so long a time, with no material qualification, been privileged to pursue the path of home industry and international exchange, to which we owe at the present moment the bright prospect of another year—and we hope it may be only one more of a long series—opening upon us with the thousands of willing English hands fully occupied, and the thousands of honest English hearts confident and proud.

In no other department of the industrial and intellectual arts does this peacefully prosperous condition of national affairs exhibit its effect more plainly than in architecture, or what may be called in the broadest sense architectural business. Great building operations, no doubt, have frequently been identified with great conquests, from the remote times when a SESOSTRIS or a NEBUCHADNEZZAR would carry home a whole population to labour on a temple or a palace, to our own days when a NAPOLEON could reconstruct his capital on new and glorious lines in honour of national ascendancy acquired by audacity of statesmanship more than by force of arms. But, throughout the whole range of history nevertheless, what we discover to be by far the most reliable source from which a nation may seek to derive the magnanimous pleasure of advancing architectural and kindred art, as a thing of beauty which is a joy for ever, is the accumulation of honestly earned wealth by the quiet labour of national industry. It is thus that the great churches, municipal halls, palatial houses, and miscellaneous monuments of Europe have been built, from the basilica of St. Mark and the *palazzi* on the Grand Canal to a

Cathedral of St. Paul and a *Madeleine*, a Palace of Parliament and a *Hôtel Dieu*.

It will also be invariably found that concurrently with the manifestation of building art on this grand scale there has been developed in all peaceful industrial times a remarkable propaganda of the artistic spirit, whereby the gracious thoughtfulness which has been devoted first to the undertakings of magnificence has gradually come to assert its authority over more and more humble manufactures, until, under favourable circumstances, the very humblest has sometimes been reached, and the whole world of local handiwork may be said to overflow with the delicate essences of artistic device. The discovery of such a display of all-pervading grace in unexpected holes and corners of the intellectual history of humanity has now become one of the most charming enjoyments of archaeology in its highest form; and not in the most cultivated regions of Europe alone, and certainly not in modern times alone, but in the Eastern world and the Western, the Northern and Southern alike, in old and very old days, and in days but dimly lighted by tradition, the explorer finds the happy work of human fingers that preferred toil to triumph and bread to blood fulfilling a mysterious destiny that covers the earth with flowers almost as tender as those of the field.

Such reflections as these will readily suggest the particular view which we are proud to be able to take of the position of our beloved country in the world of the arts. No other community of the human race, we respectfully venture to say, holds at the present moment a more promising place. Those whose reading has led them to appreciate, in even a moderate degree, the grand new doctrines of mental and social development—which are approached so often with such unnecessary timidity—will all the better understand how it is that the artistic movements which are going on around us in England are no mere accidents on the surface of events, but substantial evidences of an inevitable course of destiny and solid achievements of the genius of human progress. Nothing in this artistic condition of ours is casual; far less is it arbitrary. One of the leading intelligences in the modern world, the Anglo-Saxon mind, is steadily advancing out of a comparatively dim twilight into a bright and broad daylight of art, and the slowness and steadiness of the advance are but the surer indications of the permanency of the results that are coming and are still to come. We have several times taken occasion in the columns of *The Architect* to point out that, in a certain sense, these results are largely turning upon matters of architecture, and the more we see of current events the more satisfied do we feel that this theory is right.

This, then, is what we see just now in the position of architecture. An increasing multitude of small and unimportant building works may be said to claim critical attention; all over England, in other words, there are to be seen dainty bits of architectural design which cannot be passed by unnoticed, as such trifles only a few years ago might almost always be. Architecture, therefore, in its own province, is gradually embracing humbler occasions for conferring upon the English community that artistic enjoyment which costs so little and is worth so much. Again, throughout all the larger towns of the empire we observe more and more the spread of that

unambitious but perfectly qualified class of practitioners whose modest work is all the more precious to the public that it is so quietly persistent in its graceful career of conquest. When it is borne in mind that a shilling in the pound makes all the difference between a work of art and a heap of stones, it cannot but be a mere question of time when the common sense of JOHN BULL will pay the extra shilling; and at the present moment, exceptions proving the rule, this view of the case is plainly becoming a popular one in every direction. Londoners, for instance, cannot but see in ordinary shop fronts the architect's hand in every street where no architect's hand used to be. In country lodges, also, and cottages, stables, farm buildings, and the like, the introduction of artistic feeling is no less general; and as for warehouses and offices, even in very small towns, the employment of the regular instead of the irregular "architect" is everywhere a charming incident.

But it is in the supplementary work of the decoration of building, and in the preparation of integral compositions of ornamental art by way of specialties of manufacture, that the handiwork of the trained architectural designer is perhaps most notably asserting its influence as a novelty in England. In furniture, fixed and unfixed, in glass, in carving, in painting of one order and another, and in an increasing variety of other matters of graceful and elegant adornment, it is one of the most charming of surprises to see how the device is passing out of the hands of the wretched old "designer" in the back shop (whose pardon we beg nevertheless) into those of the accomplished architect—arch-technician—chieftain of all the workmen—whose pencil no longer moves sluggishly at the gross instigation of a salesman, but plays like the sunshine over inanimate things till they sparkle into incomprehensible life and strangely smiling beauty. Why the architect should assume this admirable function is a question which we have discussed in passing more than once; it seems as if his incidental training, in design that is connected with structural rather than mere superficial work, impresses upon his mind certain first principles of true art which are otherwise difficult of attainment; and if we remark that it is the artistically inclined pupil who takes to this artistic design, and not the mere administrator or surveyor, then may we continue to hope that the list, already of considerable length, of those miscellaneous specialists who were originally architects may still increase in number, and be magnified in honour and merit.

Turning for a moment to the condition of architectural art proper, we may acknowledge that under the Queen Anne school it is sufficiently promising. The ordinary designs which appear in the journals are certainly improving in vigour, and this in spite of a certain tendency in the style itself, which may be considered unhealthy—for it is a mongrel style at the best. Then, when we look at the competition work, of which there has been a good deal during the past year, wherein more severe academicalism has been demanded, no critic can do otherwise than agree that the power of handling more legitimate Italian composition has been very satisfactorily exhibited. Of the draughtsmanship also it may be cordially acknowledged—with whatever misgivings there may be—that better the world has never seen. In every way, therefore, English architecture is increasingly meritorious on all kinds of paper; and if this remark may be thought to suggest deterioration in execution, it may be enough to say that such is not our intention. Indeed, to go into this point, even if our present space would permit, would be quite unnecessary in view of the great edifices in the Strand, on the Thames Embankment, and elsewhere, of which the nation may well be proud. Our purpose is fulfilled if we have succeeded in satisfying the reader that, as the year 1883 opens, it finds English art in and connected with building in a condition of peace and prosperity promising in every way to prove a credit to the national character, and a substantial source of intellectual and material advantage to the national name.

THE ROYAL ACADEMY: WINTER EXHIBITION.

THE Winter Exhibition at the Royal Academy presents certain memorable features which will not fail of record by the future historian of the art of England in the nineteenth century. The collection consists, it is true, as is customary, of works by "old masters" and "deceased British artists," but for the first time the deceased artists to whose memory the Royal Academy gives the tribute of a special gathering of their pictures are not members of the academic body; the one, Mr. JOHN LINNELL, is a landscape painter whose claims to distinction were persistently ignored until he declined to accept the tardily-offered election; the other, DANTE GABRIEL ROSSETTI, kept altogether outside of any track which could have led to recognition by academic authorities. Whatever may have been the injustice, however, directly or indirectly done to these two artists, who have nothing in common but their position of "outsiders," this is not the moment in which to dwell on the injury; rather one may take this collection of their work as a sign that a wider and more generous spirit prevails in the councils of the Academy, and we may hope also a larger comprehension of the functions of art than heretofore.

This year's exhibition could hardly be "swallowed whole," even by the most voracious of Yankee sightseers, so diverse are its three divisions: first, two rooms given to the oil pictures and studies of LINNELL; then the large gallery assigned to old masters, chiefly Italian or British, and the sequence of Room IV. hung with pictures of the Dutch and Flemish schools; and lastly, the fifth room filled, and over filled, with the works of ROSSETTI—oil pictures round the walls, and three screens set up for water colours and chalk studies across the centre of the room. An admiring clique is never satisfied, and the warmest adherents of Mr. ROSSETTI's work complain that a large number, and to some extent a better selection of oil pictures, might have been gathered, while the crowding of the rooms by the screens does not give sufficient distance to the spectator. It is certainly a little puzzling why another and larger room could not have been used; and as the exhibition of ROSSETTI's pictures is likely to draw a crowd of the curious as well as the cultivated, it is safe to prophesy that a dead block will be of frequent occurrence in this part of the gallery. Meantime, a supplementary collection of drawings and pictures by ROSSETTI is being organised by the Burlington Fine Arts Club for the benefit of members and members' friends.

At this transitional period of that landscape art which Englishmen have fondly claimed as so distinctively national, it is most timely to see gathered together a fine series of the pictures of JOHN LINNELL—sturdy, thorough work that it is, full of intention, by no means unemotional, often distinctly dramatic in motive and feeling, but always imbued with an obedience to the laws of composition and a steady allegiance to nature, however scenic or assailing in appeal. Over a long life of persistent labour JOHN LINNELL worked as a miniaturist, a portrait painter, an engraver, and a landscape artist. He did not take to landscape until comparatively late, but his work in this line made so much more decided effect upon the public than his portraiture, and, owing to his long working life of seventy-five years, so large a period was actually given to landscape, that to many people it will be an astonishment to see in this exhibition such capital portraits, tender and precise in modelling of flesh, correct and firm in drawing, as the *Rev. John Martin* (36), *William Otter, D.D., Bishop of Chichester* (72), and others. To this artist might be applied the saying that if a man really has mastered the power of drawing, he can draw anything, let the subject be what it may, the human figure, a tree, or an oyster shell. In the intricacies of Surrey woodland, the blocking out of rock masses, the roll of cumulus clouds, or the delicate feathering of summer cirri, the same sure draughtsmanship guides the hand of LINNELL, as marks his portraiture. The specialty of his work was to some extent the distinct motive he gave to his landscapes by not only the introduction of figures and an incident, but the harmonising of the whole landscape treatment in accord with this motive. *The Eve of the Deluge* (8), where a lurid flush runs angrily up the storm clouds in the west; *The Last Gleam before the Storm* (9), a magnificent study of wild weather over a broken country; *Under the Hawthorn Tree* (10), a pastoral full of sunlight and air, with a sylvan figure of a shepherd piping to his flock, are cases in point; and emphatically are the landscape settings of *St. John the Baptist Preaching* (39), and *The Disobedient Prophet* (68).

Herr Ludwig Knaus, the German painter, has been elected an honorary foreign academician of the Royal Academy, in the room of the late M. Viollet-le-Duc. The other foreign members are M. Gallait, a Belgian, and MM. Gérôme, Guillaume, Henriquel-Dupont, and Meissonier, who are Frenchmen.

Mr. Caton Woodville, who is at present in Egypt making studies for battle pictures in connection with the late campaign, has received a commission from the Queen to paint the storming of Tel-el-Kebir for the royal collection.

in close relation with the subject. LINNELL was never in the East, and his naïve conception of the lands about the river Jordan, or the Nile, is merely a magnified version of Surrey hill and dale, aided by some touch of Poussinesque grandeur. When attempting to be classic and romantic with *Ulysses Landing at Ithaca*, he becomes, as did the kindred artist, SAMUEL PALMER, curiously false and unreal. In colour, LINNELL was apt to be rather too free with a ruddy brown, and a kind of liquorice tone and the trick of loading too heavily often threatened to bring cloudland into sudden collision with earth. But in this collection will nevertheless be found daylight effects as clear and bright as in COLLINS' cheerful pieces, early landscapes of a sombre quietude, almost like the work of a Tuscan old master, such as the *Bayswater in 1814* (11), and rich, juicy harmonies, in which golden brown and blue tones predominate in work of his late middle time. He was too fond of opposing a rainy sky of cold slaty purple to a warm brown landscape, and often overdid the effect so as to throw the balance of tone quite out. Several examples are here—*Storm in Autumn* (65), for instance. Among the small portraits and miniatures are some of great interest for their subject-matter, as *Thomas Carlyle*, *Edward Stirling*, *Thomas Phillips, R.A.*, and *William Blake*.

On the whole, we have in JOHN LINNELL a type of landscape painter which is fast becoming extinct—one who held that a reverential love and observance of Nature were not incompatible with the arbitrary rules of artistic composition and the exigencies of a given motive, who formed a large style upon study which comprehended detail, and whose practice rested on the principle that no work can be true or good which is not founded upon thorough draughtsmanship and a knowledge of the human frame.

The collection of "Old Masters," including men of the English school of the eighteenth century, somewhat over a hundred and twenty pictures in all, is not of course up to the pitch of former years, but the wonder is that so many good pictures are still forthcoming at all for this part of the Winter's Exhibition. Still are sent up from the inexhaustible store of family portraits, pictures by VANDYCK, REYNOLDS, GAINSBOROUGH. Lord NORMANTON sends five out of the seven designs of Virtues made by REYNOLDS for the windows of New College, Oxford. The Duke of PORTLAND contributes a VANDYCK portrait of *Charles II. when a Boy*, and the well-known three-quarter length of *Earl Strafford* holding a bâton. Of the GAINSBOROUGHS, Earl CRAWFORD's full-length of *Lady Margaret Lindsay* is most characteristic of the distinguished air, and of the silvery quality of tone so delightful in the painter's best work; otherwise the figure is rather slurred. The name of TITIAN stands against a lovely *Caterina Cornaro, Queen of Cyprus*, in green and white drapery, with jewelled border, and wearing a circlet of jewelled flowers; the flesh painting is clear and sweetly impasted, but the owner of the picture, Mr. WILBRAHAM, prevents all close criticism by covering his picture with a glass. A similar picture is in Dresden. Sir TATTON SYKES takes the centre of the north wall with his large *Pietà*, by PERUGINO, an authentic work with a pedigree, strictly in PERUGINO's conventional manner and full broad colour. The picture has not gone through several collections without being touched up. Mr. CHARLES BUTLER shows his recent acquisition from the Hamilton sale, *Moses Striking the Rock*, by TINTORET, and very well it looks. Of the later Venetian school, perhaps the fine Veronese, *Christ and the Centurion*, is the most distinguished example—a noble composition of many figures, divided into opposite groups, to which the kneeling figure of the centurion forms the connecting link. Lady AUDLEY's large panel, *Virgin and Saints*, ascribed to BELLINI, is in that restored state which suggests suspicion, sometimes unworthily. More interesting is the picture sent from the Irish National Gallery, half-length, under life-scale, *Portraits of Two Gentlemen*, of whom one wears the simple grey mantle and red cross of a confraternity, while the other is richly attired. The ascription of authorship is conjointly to GIO. BELLINI and GIORGIONE. There is an inscription on the back of the panel, *Beazzano et Navagero, Poetes*, with GIORGIONE's name—hence one-half of the surmise; the other one may presume to rest on the workmanship of the right-hand figure in the grey mantle, whose rather dilly modelled face and pencilled fair hair certainly is closely in the manner of BELLINI.

In Dutch pictures the Winter Academy is always rich. Once more JAN STEEN is seen at his best in the *Card-players*,

from Buckingham Palace; the large picture of a *Village School*, from Dublin; and the *Merrymaking*, lent by Mr. THOMAS HARDCASTLE. REMBRANDT in blunt naturalism is to be seen in a partially undraped *Female Portrait* and *Susannah and the Elders*. *Daniel's Vision*, lent by Sir E. LECHMERE, is the same subject as a smaller picture, now at South Kensington, of *Tobit and the Angel*, in the JONES bequest; this has fine and genuine qualities. Sir W. W. KNIGHTON attributes to REMBRANDT a delightful interior, full of picturesque detail, with one figure of *A Student*, which we should be more inclined to ascribe to a scholar in the school—possibly to BOL, by whom there is a capital *Portrait of a Girl*, in a crimson hat and bodice, lent by the Marquis of LOTHIAN. The large group of *A Lady and Child*, by CORNELIS DE VOS, of the Dutch family settled at Antwerp in the seventeenth century, has deservedly for its high quality been hung in the large room. Mr. BUTLER is the owner, who also, among his many contributions, sends a fine *Study of an Ecclesiastic*, by PONTORMO, reddish in the flesh tints, dry in manner, but full of character, which we omitted to name among the Italian pictures. If, by the way, BONIFAZIO painted the *Adoration of the Shepherds*, which comes from the same collection, he did not paint the *Dives* that hangs above, belonging to Mr. INGRAM, or *vice versa*; a safe conclusion might be that he painted neither. Nevertheless, Mr. BUTLER's picture is genuinely of the *genre* school of Venice.

Among miscellanies in Room V. a portrait of *Joseph Bonomi, B.A.*, by the seldom seen F. RIGAUD, should be noted; the Marquis DE SAUTURCE sends his beautiful little study of the *The Dauphin, Son of Louis XVI.*, by GREUZE, and some good Dutch landscapes; 1 sea-pieces are to be found. Lovers of English CONSTABLE will not fail to take delight in the little *Sketch of sloping green fields* and blue distance sent by Mr. C. L. COLLARD; though only a rough sketch, it is delightful in quality.

The pictures by DANTE GABRIEL ROSSETTI we must defer to another notice.

THE ARCHITECTURAL EXHIBITION, EDINBURGH.

AN exhibition devoted exclusively to architecture is a novelty, and certainly is useful to the young student. The one now open in Edinburgh is successful. The committee of the Architectural Association applied for the use of two rooms in the Royal Academy Galleries, but afterwards it was found that the whole suite would be required to hold the number of exhibits, amounting to about 1,200 in all.

The regular visitor to the Royal Academies in London and Edinburgh, or the general reader of the professional papers, will find little new to him here in modern architecture. But beyond modern architecture, the Exhibition, as is natural, is rich in representations of what old Edinburgh was, before the much-required city improvements were carried out. Few of those who walk along Princes Street, admiring the serrated outline of the Old Town, between Holyrood Palace and the Castle, thoroughly realise that the valley occupied by the gardens and the Mound was for about three hundred years covered with water, as a defence to the city on the north side. Towards the end of the last century the embankment at the east end was removed. As the erection of the New Town buildings was proceeded with, "the Mound" was gradually formed of excavated materials, in order to supply the want of direct communication between the Old and the New towns. Thus these galleries, in which the exhibition is held, stand about the centre of what was once the Nor Loch—a place of fashionable resort for boating, and where swans and wild duck were preserved. There are no drawings indicating this state of things. The oldest is a coloured drawing, taken about the beginning of this century, showing the grassy slopes of the "Mound" as seen from Princes Street line. Another shows the general look of this district from the Calton Hall. There is also a carefully-drawn view of Trinity College Church by BILLINGS, as seen from the North Bridge before its destruction for North British Railway purposes.

Of the modern works now seen near this valley, there is the original competition drawing for the Scott Monument by KEMP, which has been carried out with little alteration, and the design for the Free Church College by PLAYFAIR. It is the towers of this last building which RUSKIN gibbets in his own ruthless way. An interesting document is the original feuing plan, lent

by the City Corporation, which shows the lines of the streets of the proposed New Town, as designed by JAMES CRAIG, corresponding very nearly with the town as built.

Although Edinburgh does not possess municipal buildings worthy of the name, many schemes for such have been mooted. Now that Glasgow has led off so brilliantly, Edinburgh, it is to be hoped, will soon follow suit. There are two different designs exhibited for different sites. One site is now unavailable, being occupied by the Waverley Market. The other site, in St. Andrew's Square, could not readily be had. That question of site—Old Town against New Town—will probably keep this scheme back till it becomes an imperative necessity.

In the Old Town most of the narrow picturesque closes have now disappeared. The best of them, however, are here restored to us in drawings by JAMES DRUMMOND (who was so careful in detailing the architecture of his backgrounds), ROBERTS, CAMERON, M'CULLOCH, NASMYTH, and DUGUID. Many of these Old Edinburgh features appear repeatedly, such as Holyrood, the old tower of the Canongate Tolbooth, St. Giles, Cardinal BEATON'S house, and others.

An interesting supplement to these drawings and paintings of Edinburgh is a collection of portraits of architects. Among them are the brothers ADAM (not unknown on this side of the Tweed), PLAYFAIR, and HAMILTON. The most quaint is that of "WILLIAM AYTOUNE, Master Meason, of Heriot's Work, and Spouse," lent by the governors of Heriot's Hospital. GILLESPIE GRAHAM, the architect of the Assembly Hall, figures in the character of a Highland chief in full costume. A portrait of PUGIN in his monastic garments would have made a fine antithesis to this.

In the exhibition are many sketches of architectural "bits," both from the provinces and continental towns, all more or less familiar to students.

The top of the belfry of St. Nicolas, Caen, seems to have been "restored" recently. We miss the delightfully dilapidated tilt of the vane-rod, in Mr. MORTIMER'S sketch, which it had when we saw it last. Mont St. Michel appears to be an island no more. The projected railway embankment is now evidently *fait accompli*. The student may sketch in peace, and not with one eye to the tide and the other to the Mount, as formerly. Mr. PHENÉ SPIERS contributes a series of charming drawings in water-colour. There are also several dainty drawings in colour by PUGIN of churches in Rouen.

Of the designs for buildings recently erected, of local interest, those for the new Cathedral naturally attract considerable attention. Sadly enough, their authors—SCOTT, STREET, and BURGESS—are no longer among mortals. The designs by STREET and BURGESS, though only on paper, are memorials of their genius, which will not readily be forgotten. Of the executed design, two drawings are exhibited, an exterior with the two western towers added, and an interior. The central tower does not please the native eye. The general opinion is that the tower is too "thick." This is simply the result of seeing the design incomplete. The two western towers, with their more delicate proportions, are required to restore the harmony of parts. Without entering into the merits of the design, it may be safely affirmed that neither of the other two would, if executed, have given as much popular satisfaction. Those of STREET and BURGESS were too unambitious.

Of more importance, though not of local interest, is Mr. STREET'S bird's-eye view of his first design for the Law Courts. As a piece of draughtsmanship it is unique. But it is to the character of the design we would draw the attention of the student. Gothic design in modern practice is adapted, arranged, and copied—not to say mangled, but how seldom is it conceived? The greatest homage rendered to a modern architect was that offered by SCOTT to STREET in an address given some years ago to one of the societies. Speaking of STREET'S designs, he said—we quote from memory—that in examining them he was often struck with the distinct character of particular parts, which at the same time had an almost familiar look. On reflection he found that these parts were quite original, their seeming familiarity being the result of conception in the true Gothic spirit. In this design are many such parts, specially in the towers. Their character is quite original and quite Gothic. We are of course talking of design pure and simple. There may be differences of opinion as to suitability and convenience.

A few of the competition designs for the Glasgow Municipal Buildings are exhibited, and among them the first and second designs submitted by Mr. YOUNG, the successful competitor. It occurs to us, on looking at the elevation of the accepted design, that the columns or pilasters of the first floor windows appear to support most ineffectually the horizontal base lines of the principal or second floor, there being no lintel proper to the first-floor windows.

Mr. WATERHOUSE exhibits his Manchester Assize Courts—a beautiful drawing, and probably his most successful effort in Early Gothic design. His chapel and clock-tower at Eaton Hall have as much of the municipal as the ecclesiastical character in their detail.

As a designer of mansion-houses in the Scotch Baronial style, the late DAVID BRYCE was probably without an equal. The coloured drawings of Cortachy Castle, The Glen, and Castlemilk all testify to this. In the latter design the foreground is occupied by a hunting "meet," in which SAM BOUGH has well rendered the activity and brilliance of such a scene, to the detriment of the architectural effect.

Mr. NORMAN SHAW is well represented by Pierrepont, Adcote, and Wispers as examples of his work in the Old English revival. Pierrepont in one of its elevations is plain even to monotony, suggestive of a row of almshouses. Wispers is a drawing of a clever design, taken from a most effective point of view.

Next to the Cathedral, the building of most local importance is the Medical School in connection with the University extension now approaching completion. Mr. ANDERSON has been very successful with this design, which shows an effective campanile. In his original design this tower rose from an inner court. It is a matter open to question whether this was not better than introducing the tower into the front elevation and butting cornices against it. In his church designs Mr. ANDERSON is pure and unaffected.

When the design of the late ALEXANDER—otherwise Greek—THOMSON was rejected for Free St. Mary's Church, Edinburgh was the loser. This design, almost in its entirety, has been erected in St. Vincent Street, Glasgow, and is one of the most successful architectural features of that city. There is an entasis on its square tower, quite pronounced enough to be noticed, in addition to a slight taper. His Queen's Park United Presbyterian Church also shows that character of Greek design which he made his own, adapted to a less ambitious church. Its interior as now completed is one of the finest in this style it has been our fortune to see, and is very imperfectly represented by the photograph.

There are many designs for churches and spires in the Exhibition more or less ambitious, in which height of spire and profusion of ornament seem to be the principal aims to the exclusion of simplicity or originality in design. On those which do indicate originality we will not venture to write. This will be readily understood when we mention there was no selection of subjects by the committee.

In the last room of the Exhibition there is a display of Brussels and Gobelins tapestry, and sketches of architectural detail principally by members of the Association. There are also designs for stained glass. That by ADAM & SMALL for the circular window of a small Presbyterian church at Juniper Green, showing a dove in the centre and flowers and fruits of Scripture in the external cusps, is strikingly bold and simple.

GUSTAV CRAUK.

[BY A CORRESPONDENT.]

A NOTABLE event in Paris is the completion of the model of M. CRAUK'S statue of COLIGNY, which is now being executed in marble. M. CRAUK is one of the last representatives of the Classic school, and therefore the exponent of a style which is opposed to the realistic tendencies of the day. Realism and Classicism met in combat on November 18, in the Council Chamber of the Academy, on the occasion of the election of a member of the Institute in lieu of JOUFRAV. The champions were FALGUIÈRES and CRAUK. FALGUIÈRES gained, and no one could be more surprised than he was at the result. He fled from Paris to avoid the congratulations of his friends, and returned to find the door of his atelier covered by their signatures. It is of the champion of Classicism that we have now to write.

GUSTAV CRAUK'S studio is one of the most inaccessible in

Paris. Absorbed by art, overwhelmed by work, conscious of the genius with which he is endowed, reserved and somewhat brusque, the visits of strangers are to him insufferable. But when the stranger has crossed his threshold the generosity of his nature overcomes the first impulse which distinctly suggests to him KING EDWARD'S remark to PHILIPPA, "I wish you were anywhere but where you are."

Some 200 years ago, in the days of the Grand Monarque, an ancestor of M. CRAUK emigrated from Germany. The German idiosyncrasy is ineffaceable. Not in outward appearance alone, but in countenance and manner; the quiet, resolute will, perseverance and tenacity of purpose of the Teuton is more striking in GUSTAV CRAUK than the fiery enthusiasm of the Latin race. His working studio lies at the lower end of a court in the remote Rue Vaugirard, on what the Parisians of the Champs-Élysées would call "the other side of the Seine." A work of extraordinary beauty, *Triton and Tritonide*, apparently placed outside the atelier for lack of space within, is on the left, and while waiting admittance the visitor can contemplate the power shown in the grouping. The right arm of the sea nymph is raised above her head, and rests on the upper edge of a gigantic shell, supported at its base by the Triton. The work is in bronze and intended for a fountain. It will be sold to the French Government to the exclusion of foreign competitors. On entering the studio one is immediately struck by the latest expression of CRAUK'S genius—the statue of COLIGNY.

Before describing the work it may be of interest to state that, with the aid of M. le Pasteur BERSIER, a committee has been formed of leading men of the various parties in France for the erection of a memorial of the hero of the Reformed Faith on the spot where, on August 20, 1572, the Admiral, who had just left the Privy Council presided over by CHARLES IX. at the Louvre, was fired at and severely wounded by MAUREVERT, the Queen Mother's emissary. The great surgeon AMBROISE PARÉ hoped to save him, but during the massacre of St. Bartholomew's night, BESME and four Guisards broke into COLIGNY'S house and stabbed him in his bed. Their vengeance did not end with his death; good COLIGNY'S hoary head all dabbled with his blood was kicked by the Duc DE GUISE, who then helped to throw his body out of the window. That France, whose Government has struck religious instruction from the curriculum of public education, should not only grant a site for the erection of the memorial, but undertake to pay a third of the cost (amounting to 150,000 francs), is a remarkable circumstance.

One must recall the leading circumstances which formed the character of the hero whose spirit CRAUK has embodied in the statue, as well as the stern character of the Huguenots of the sixteenth century, in order thoroughly to appreciate its grandeur of expression. CRAUK'S statue is colossal. To secure a correct likeness the portraits at Florence, Genoa, and Chantilly have been consulted. COLIGNY stands in the dress he wore habitually. His head, covered by a toque, is slightly bent forward. The expression of his worn but regular features is that of concentrated thought and indomitable resolve. His right hand is firmly closed and laid over his heart, his left grasps the hilt of his sword. A slashed pourpoint and troussees, high boots of Spanish leather display to advantage the lines of his strongly-knit frame. A short cloak lined with fur with its high-standing collar is thrown on his shoulders, and displays rather than conceals his figure. "Ung foi, ung loi, ung roi" was the device COLIGNY preserved unsullied in the most licentious Court of Europe, and the sculptor has embodied the spirit as well as the outward bearing of the hero. Perhaps the words of M. JULES BONNET, a writer whose works have been repeatedly crowned by the Academy, best epitomise the impression the work leaves on one's mind: "GUSTAV CRAUK est pour nous le noble artiste qui a su ressusciter le héros dans le double rayonnement de la Foi et du Génie." The statue is destined to a central place over the cenotaph, which it is hoped will contain the Admiral's bones, now entombed in an ivy-covered tower of his old château of Chatillon. Life-size medallions of COLIGNY'S brothers are to be placed to right and left of the statue, in the screen which is flanked by fluted columns, and forms the background of the monument. DANDELOT bears a strong resemblance to his brother. A gallant soldier, oftener in saddle and camp than at court, his countenance denotes dauntless courage. The edge of his leather jerkin is seen beneath a coat of mail. A head of an opposite type is

that of the politic and astute cardinal; the point lace of his jabot indicates the luxurious dress of the ecclesiastic of the sixteenth century, while his refined features have an insinuating and lively expression.

In the immediate foreground are recumbent figures of *Religion* and *Patrie*. RELIGION, enveloped in the folds of heavy drapery, gazes onward with calm resignation on her sorrow-worn countenance. PATRIE, clad in antique armour, grasps his sword and looks up to COLIGNY, ready to spring to his feet and die for his country. Repose and action are admirably contrasted in these figures. They are on a scale of 9 feet. The whole monument will measure 40 feet by 40 feet. M. le Pasteur BERSIER'S erudite and eloquent discourse on COLIGNY, which last spring filled the Oratoire to overflowing, was repeated lately at Rheims. It is rumoured that this distinguished orator may cross the Channel next spring for the purpose of holding a conference at Oxford, in the hope of arousing the sympathy of the English public in a work of historic interest, the completion of which depends on the funds subscribed, of which a third as yet is wanting. The statue may possibly be exhibited in London. These rumours, however, are but studio gossip.

A bust of JULES SANDEAU and one of TISSOT, in the inner studio, at once transport us to our own times. JULES SANDEAU, the apostle of the romantic school, he whose name suggested the pseudonym adopted by the brilliant authoress of "Consuelo," has the dreamy expression of a poet. He looks at you, but his thoughts are plainly far away; whereas TISSOT, the *spirituel* author of "Le Pays des Milliards," the accurate statistician, the critic of his country's foe, the epigrammatic writer, looks with a penetrating glance, smiling, as it were, at one's weak points.

Behind these is a group entitled *La Jeunesse et l'Amour*, probably the most poetic of all M. CRAUK'S works. Youth, fresh from her bath, reclines on the mossy bank, on which some drapery has fallen. Her head rests on her right arm, which by a movement of peculiar grace is bent backwards, the hand falling with careless ease downwards. The hair sweeps from the forehead in heavy masses to the ground. The limbs are slightly crossed. Perched, or perhaps crouched, on her thigh, with an infantine playfulness difficult to define, is Cupid, whose roguish glee as he looks at his latest victim is inimitably rendered. *La Jeunesse* naturally catches one of his wings and holds it meditatively, meeting love's first glance with grave surprise. In pointing out the group M. CRAUK remarked, "la terre cuite, c'est la vie; le plâtre, c'est la mort; le marbre, c'est la résurrection," he considers it was more perfect in its first stage of creation than it is in its second. M. DUMAS *fils* pronounced "la poésie même," and we subscribe to his verdict. A bystander inquired by what artifice M. CRAUK had induced the model for *l'Amour* to sit. His reply was significant and characteristic. "His mother kept the child still, and thirty years of study did the rest." *La Jeunesse et l'Amour* ought to be placed in a large hall, in a position to allow of all the modelling to be studied. The group is a singular example of classic purity of form and antique grace. Speaking of it M. CRAUK said, "Although a pupil of PRADIER, I have not followed in his steps. RUDE, perhaps, influenced my style more than any modern sculptor; but I represent the sculptors of the seventeenth and eighteenth centuries—such men as PUGET, COUSTUS, BOUCHARDON, and Houdon." Ideal as is his standard, there is a virile strength of execution which has more of the Michaelangellesque than of the "effetierie" of PRADIER. Yet PRADIER was his master. CRAUK, speaking of the late sale of the Duke of HAMILTON'S pictures, mentioned that he had been summoned to the Tuileries to make a bust of the Empress EUGÉNIE for the Duke of HAMILTON, which bust is still, he believes, at Hamilton Palace. But of all his reminiscences of sitters, none are more amusing than those of the Shah of PERSIA, whose bust in bronze is in the studio. The king sent for him during his first visit to Paris, when inhabiting the Palais Elysée, and ordered him to stay at the palace. M. CRAUK inquired at what time in the day he should hold himself in readiness to take his likeness. "From ten o'clock till sunset," was the reply of the Oriental. Accordingly M. CRAUK set about his task, the Shah on several occasions sitting imperturbably passive, while forty persons were waiting for an audience, and among them were ambassadors, ministers, and statesmen. On one occasion, however, the Shah gave orders to admit Marshal MACMAHON, whose bust M. CRAUK had executed, and who shook hands with the sculptor. This took the Shah by surprise, and he inquired

of M. CRAUK if he were the only sculptor in Paris. The Shah invited him to Teheran, promising him honours and great riches as a reward for his expatriation.

GUSTAV CRAUK carried off the Prix de Rome in 1851, and spent four years at the Villa de Medici. From Rome he sent the statue in marble of the Elysée now in the Musée de Valenciennes, and the *Bacchante* and *Satyr* in the gardens of the Palace of Fontainebleau. His next important work, the statue of *St. John the Baptist*, is in the church of St. Denis du Sacrement in Paris. The *Fawn with the Amphora*, now in the Musée du Luxembourg, preceded the fine statue *Victory*, commemorative of the Crimean campaign, which occupies the centre of the Place des Arts et Métiers. The statue is in bronze, and stands on a column. The winged goddess holds the standard of France, surmounted by the imperial eagle, with her right hand. She crowns the standard with a laurel wreath. The pediment of the Pavillon Marsan at the Tuileries, the gable end of the Mairie of St. Germain l'Auxerrois, the church of St. Eustache, the chapel of the Ecole Normale, the cloister of the convent church of Charenton, the façade so familiar to English travellers of the Northern Railway terminus, have all been enriched by sculptures in stone due to the chisel of M. CRAUK, as also the tomb of JEAN BOELARD at Père-la-Chaise, surmounted by a fine statue of *Grief*. One of his best busts is of M. SANSON, who may justly be said to have formed the modern school of French actors, is placed over the veteran comedian's tomb at Montmartre Cemetery. The likeness is striking and marvellously vivid. The winged figures on a colossal scale supporting the central shield over the stage of the theatre in the palace of Compiègne, as well as the figures of Tragedy, Comedy, Music, and Dancing which decorate the entrance, were executed by CRAUK by command of the late Emperor. On the square of the Observatory, however, is perhaps one of the most classic of his works. The subject is *La Crépuscule*. Twilight implies a period of rest after toil. A labourer leans on the shaft of a plough, while his companion, seated on a knoll of earth, is sleeping. A scythe is in her left hand, while the right arm falls in a straight line by her side. The only drapery in this composition is that which partially covers her right knee. The profound repose of the woman's figure is perhaps the salient point as regards the expression of idea in this work; the perfect modelling of the figures, and the grace and science displayed in their grouping, the striking points as regards its execution. The Caryatides which support the Government box at the new Opera House are examples of the adaptability of genius to all branches of art. They are partially gilded, and are executed in coloured marbles. A statue in bronze of Marshal VALLÉE, the general who captured the city of Constantine during the early part of LOUIS PHILIPPE's reign; the statue of the eminent surgeon DUPUYTREN, 9 feet in height, erected in his native town of Pierre Buffières; a bronze statue of the Comte DE MONTALIVET, Minister of the First NAPOLEON, erected in the town of Valence; a marble statue of Marshal PELISSIER, Duc de Malakoff, in the Palace of Versailles; a bronze statue of Marshal NIEL, Minister of War under the Third NAPOLEON, erected in the town of Muret; a marble statue in the Palace of Versailles of the late President of the Republic, MACMAHON, Duc de Magenta; a marble statue of the Intendant d'ETIGNY, in the town of Bagnères de Luchon; one of CLAUDE BOUGELAT, in the costume of the last century (founder of the Veterinary Schools of France), are among the best known of M. CRAUK's works. He departed from his classic style in the statue of MARGARET OF FLANDERS and HAINAULT, which is purely Gothic in treatment. That excellent Princess founded in the thirteenth century the hospital of Seclin, which still exists. The statue has recently been erected as an act of grateful recognition for benefits conferred four hundred years since. The statue of General FAIDHERBE, who had the signal honour of defeating the Germans at Bapaume, is among the more recent of his works. The general, in undress uniform, over which he has thrown a loose great coat, stands, kepi in hand, the impersonation of a gentleman and a soldier. There is a direct simplicity in his attitude and expression which conveys at once to the mind the impression of the unflinching resolution and masterly prudence he displayed during his command of the Armée du Nord. His defence of Lille, gratefully remembered by its inhabitants, is commemorated by the statue they commissioned M. CRAUK to execute for their Town-hall.

The unfinished works now in the studio are, besides the

monument of COLIGNY, Caryatides representing Medicine and Surgery for the decoration of the Ecole de Médecine, Paris. The foregoing list includes but a portion of M. CRAUK's artistic productions. There are no less than one hundred busts extant due to his chisel, yet GUSTAV CRAUK has scarcely attained the meridian of life. Unflagging industry may be considered as a matter-of-fact and somewhat commercial quality; nevertheless genius unsupported by persevering effort will not produce an example of success such as GUSTAV CRAUK has already attained. "Trente années d'étude" is the key to his career.

PARIS NOTES.

AT the Ecole des Beaux-Arts preparations are now being made for the exhibition of the works of the late Henri Lehmann, member of the Académie des Beaux-Arts, the opening of which is fixed for the 15th inst. By the will of this artist all the works, drawings, &c., found in his studios are to be sold by public auction, and the proceeds devoted to found either a prize open for competition to young painters, or a fund to aid artists in need.

On the Fête de Sainte Geneviève four new mural paintings at the Panthéon were unveiled to public view. They are situate alongside the Chapel of the Saint, and represent four separate episodes in the life of the patroness of the French capital.

M. Edmond Le Blant, member of the Académie des Inscriptions et Belles Lettres, has been named Director of the French Art School at Rome for a period of six years, from the beginning of 1883, in place of M. Geffroy, whose term has expired, without an application on his part for reappointment.

The managing committee of the Association of French Artists are considering the expediency of creating a special agency to act between artists and art-publishers, and so ensure to the former just payment for the reproduction of their works. It appears most probable that the idea will be carried into execution, and great things are expected from it in protecting artists from the unprincipled appropriation of their creations to which they are now so frequently subject.

The jury in the Prix de Rome competitions consist of a committee of competent members of the Académie des Beaux-Arts, assisted by a certain number of prominent artists designated by the Académie. These artists are, however, invested with consulting powers only, and have no vote in the decisions of the body. On the proposition of M. Ch. Garnier, the Académie lately named a Commission to examine this jury question, and especially as to whether the present organisation should be maintained or a vote henceforth accorded to the consulting artists. The members of this Commission being equally divided in opinion on the matter, the chairman was obliged to report to the parent body that no agreement could be arrived at. In a subsequent sitting of the Académie it was resolved, after a lengthy and somewhat stormy discussion, that no change should be made in the existing composition or attributes of the jury; and the question is thus settled for the present.

The Mexican Government have decided to establish permanent exhibitions of Central American products in Paris and some of the other chief cities of France, with the object of developing the commerce of their country.

The workmen engaged in removing the ruins of the Tuileries have already made a discovery of considerable artistic importance in the shape of a number of fragments of the old Philibert Delorme columns, which were found embedded in the soil under a large block of masonry. The original pillars have in the course of years been almost all destroyed and rebuilt, so that this find is one of great interest as establishing their character and style.

The three bells for the clock of the Hôtel de Ville, which have been cast by MM. Crouzet & Hildebrand after the designs of M. Ballu, chief architect of the building, will be hung during the present month. They weigh, respectively, 2,400, 800, and 550 kilos., and bear the arms of the City of Paris without any more elaborate inscription than "Septembre, 1882."

The death is announced of M. Cathelenaux, the well-known animal painter. Born at Warcq, Department of the Meuse, in 1819, he devoted himself to the study of animals, especially dogs, and it was mainly to his paintings of the latter that he owed his fame. His loss will be severely felt by the realists, and by followers of Delacroix, whose pupil he was. Several of his paintings may be seen in the Luxembourg Galleries.

The French Society of Civil Engineers have elected the following officers for the present year:—President—M. Ernest Marché; Vice Presidents—MM. Martin de Comberousse, Courras, and Yvan Flochat; Secretaries—MM. Douan, Vallot, Delaporte, and Aug. Moreau; Treasurer—M. Loustan.

The competitions for the remaining work necessary in the reconstruction of the Hôtel des Postes were held last week under the superintendence of the Inspector-General of Civil Buildings, assisted by MM. Garnier & Guadet, architects. Tenders had been invited for three lots, the total limit price being 1,645,000 fr., and the results as follows:—1. Roofing, plumbing, &c., limit price 565,000 fr. Eight tenders were received, varying from 12.60 per cent. to 28.20 per cent. off, the latter being put in by MM. Roumens Frères, who secured the work. 2. Carpentering and joinery work limit price 700,000 fr. M. Laureille tendered at 5.70 per cent. off; M. Bonhomme at 6.20 per cent. off; and M. Simonet, who received the award, 8.30 per cent. off. 3. Painting, glazing, and gilding, limit price 380,000 fr. Thirteen tenders were received, varying from 15 per cent. to 27 per cent. off; M. Blanc, who put in at the latter price, being declared as adjudicataire.

Work on the new hotel is being pushed on with the greatest possible activity, and the architects expect to be able to deliver the building for public use at a date considerably earlier than the limit accorded, which was December 31, 1884. The neighbourhood of the building is now being cleared, and the demolition of the remaining portions of the old Post Office was commenced this week. This clearance will necessitate the disappearance of the remains of the old Hôtel Bullion, and of the houses at the angle formed by the Rues Coquillière and Jean Jacques Rousseau.

The Hôtel Bullion, which has undergone so many changes and mutilations, was built in 1630, after the plans of the architect Levau, for Claude de Bullion, the Superintendent of Finance, on a scale of hitherto unknown magnificence. In the entrance hall were two large paintings by Philippe de Champaigne, representing receptions of Knights of the Order of the Holy Spirit—one at Fontainebleau in 1633, the other at Rheims in 1654. The ground-floor gallery contained thirteen oil panels by Blanchard, intermingled with allegorical paintings of the various occupations of man under the signs of the Zodiac. The first-floor gallery, which was decorated throughout by Vonet, exhibited the adventures of Ulysses in fifteen mural paintings; nineteen frescoes covered the ceiling, and stucco figures by Sarrazin completed the ornamentation.

The Hôtel de Bullion, after being inhabited by three generations of the same family, was destroyed in 1777, and the painter Failler, who purchased the site in 1780, constructed thereon three dwelling-houses, upon one of which may still be seen the inscription Hôtel Bullion.

A VALID TEST OF PROFESSIONAL ABILITY.*

IT were most devoutly to be wished that this subject were in abler hands, but it is hoped that the suggestions herein offered may incite advantageous discussion and result in suitable action if deemed worthy.

The suggestion is offered for your consideration, the establishment of a Board of Examiners composed of gentlemen eminent for their professional attainments, whose duty it shall be to ascertain by *rigid examination* the *qualifications* of candidates for *degrees*, with the vested right to grant diplomas in accordance with the rank and standing of such applicants.

Why the necessity of such action? If there be a necessity, then what manner of men arise up with the right to construct such a board? First, as to the necessity: in every profession there is more or less of the evil of malpractice to contend with, but that of architecture seems to have more than its quota, for the reason that there is no established authoritative defence whatever.

Most professions are protected to a considerable extent by examinations and diplomas, and with a proper diploma one is armed with authority to practice; in most instances this authority establishes the confidence of clients and the practitioner moves onward and upward "*mens sibi conscia recti*;" while those who are not thus provided are obliged to speak through the world self-upbraided impostors sooner or later exposed—the public thus cautioned and the particular profession indirectly benefited by such exposure. Not so with architecture; in the present order of things (or, more properly speaking, *disorder*) *our* profession is comparatively un-

prepared to resist attack, is unable to meet opposition, and has no security against "foes within the ranks." There is no law, rule, or usage by which designing men may be commanded "thus far shalt thou go, no farther." A man (generally a young and ambitious one) tired of home, and anxious to improve, is desirous of adventure; armed and equipped with perhaps a shoemaker's kit, or a set of tinker's tools (or other equally proper and suitable architectural traps and accessories), and possibly a piece of chalk, together with plenty of assurance, he moves out into the country to seek his fortune and to grow up. Well, if nothing offers in the way of honest employment at cobbling or the restoration of dilapidated tin-ware, then as a *dernier ressort*, and not being particular or proud, this inevitable and irrepressible genius falls back on the piece of chalk, puts out his shingle as "So and So, Architect," and in too many cases succeeds, *i.e.*, succeeds in heaping dishonour upon a worthy but unprotected profession. This may seem a somewhat exaggerated character of co-worker, yet many or most of you have undoubtedly met instances almost, if not quite, as bad as this. I have known several that were worse, for the fellows were minus the before-named tools, &c., and had only the impudence and irrepressibility; but what they lacked in one respect was fully made up in the other.

In almost every town and hamlet in the land there is a greater or lesser number of these untutored pretenders, men who were never taught, and never acquired even the rudiments of the science; who are unfamiliar with a single principle upon which it is based; who know nothing whatever of the history of architecture or the peculiarities of orders or styles; nothing of the elements of design, nothing of decent, not to say proper construction. There are others a shade more advanced, who perhaps have been in an architect's office, and after a few months' destruction and waste of stationery therein, have graduated and gone out into the wide, wide world, full-fledged with cheek, tongue, and impudence; who call themselves architects, and

do botch and bungle up
With patches, colours, and with forms.

Of such are the pseudo co-operant forces; their name is legion, and as one is adjudged by the company he is in, the public, looking upon every one as an architect who styles himself such, naturally charges any incompetency to the profession at large. Modesty bespeaks merit, but sometimes merit is so exceedingly modest as not to speak at all; hence the charge too frequently goes unanswered.

The question arises then, what may be done in the premises? We submit that the suggestion initiatory of this paper will to a great extent meet the demands. It is not desired or deemed indispensable necessary, perhaps, that one should be thoroughly versed in every department of the science before he shall be able to commence practice; but we submit that the limit and extent of practice should be held strictly in accordance with a degree granted by proper authority, and one should continue in this degree until proficiency entitles him to advancement. There should be, we think, a certain number of degrees arranged, graduated, and determined upon by this board, and careful examination made in each. It is suggested that these degrees include among other acquirements a thorough knowledge and familiarity with *Classic Architecture*; this is an all-important and absolutely necessary foundation for the proper and successful study of architecture. True and standard proportion is here to be found (not to raise the question of beauty of detail) in it is the soul and sentiment, the true and fundamental element of design; the correct theory of proportion; it is to the student or practician what anatomy is to the sculptor. Without a knowledge of the situation, structure and economy of the different parts of a body, the sculptor is not properly able to give true expression to a face or form, nor to produce a gracefully draped figure; in like manner, to the architect a knowledge of classic architecture is the underlying and governing principle of design.

Besides a proper standing in this branch, there should be a due amount of information as to styles and purity of detail outside of the orders; construction, materials, their strengths and methods of application, a general knowledge of mechanical work in the various trades, sanitary conditions, drainage, ventilation, acoustics, heat and light, preparation of various grounds and foundations—in short, a general and practical familiarity with the numerous and varied branches and parts which necessarily combine to form a thorough knowledge of the science or art of good, proper, and correct building. Candidates should pass examinations with credit; and degrees with diplomas, conferring the power and authority to practice in accordance with the standing adjudged, should be granted to those who have worthily passed to the required grades of such degrees.

This requirement for honourable practice is not too exacting; those who cannot creditably pass such an examination are not fit to be entrusted with works involving an outlay of capital and a risk of life and limb; if something of this kind may be thought advisable, and is put into execution, we think that even members of the profession who already possess acknowledged ability, will not object to, but will favour, rather, the endorsement of good authority, and incompetency will be marked and held at bay. The public may then be apprised, and may

* A paper by Mr. A. C. Nash, read at the Sixteenth Annual Convention of the American Institute of Architects, and published in the *American Architect*.

engage those who are vouched for as skilful, or themselves be in a measure to blame for any failures through the employment of incompetent persons.

Now, if there be a necessity for a movement in this direction, who shall be the appointees of said Board? The answer—Who may more properly act in such capacity than those of acknowledged ability within the body of the American Institute of Architects?

This is the largest and most important collective body of architects on this Continent. The objects of this Institute, as declared and adhered to, are "to unite in fellowship the architects of this continent, and to combine their efforts so as to promote the artistic, scientific, and practical efficiency of the profession." Argument seems unnecessary to sustain the proposition that the Institute would be the proper authority, and that if a move should be made in the direction suggested, it should emanate from this source.

We would also respectfully suggest in this connection that the number of the F.A.I.A. should not be limited to seventy, as at present. We think that there should be no limit; the gates of this Institute should be "gates ajar," for the free ingress and welcome of all such as apply, and are worthy and well qualified, and for the gentle egress of those who are not, if any such there be. We would not for a moment be understood to insinuate that there is a doubtful member; far from such thought, we believe that gentlemen of the Institute would not object to this examination and its accompanying endorsement. But if this body of architects should decide to establish a board as suggested, the law of self-preservation would dictate self-examination, and it would become its first duty to so act as to be able to stand entirely above suspicion; it should act firmly in accordance with the spirit and letter of that teaching which commands, "If an eye offend thee, pluck it out."

Again, as regards the number of Fellows, we respectfully urge that none who are properly qualified should be kept out; all laudable effort should be made to increase the membership; there should be no isolation of the component parts of the general machinery; there should be the combination of a perfect whole. Thus the machinery may be set to working for the achievement of the greatest results. In all things, in every phase of existence, in things animate and inanimate, from materiality to mentality, from things to thoughts, in unity there is strength; in combination there is power; with intercourse and interchange of thought there is enhanced ideality.

HABLOT K. BROWNE AND DICKENS.

DR. E. A. BROWNE, of Liverpool, referring to the assertion that Dickens was not always satisfied with the representation of his ideas by "Phiz," says that this would not be at all a surprising circumstance if true, and it would be a matter of small moment if the illustrations which have delighted and satisfied two generations of readers did not always happen to have fulfilled the ideal of the author. But even this difficult task was accomplished. The excerpts from letters written during the progress of the works require to be accepted with some caution, and do not appear to me to refer as a rule to the finished plates, but more often to the preliminary draft sketches. Nor must an opinion expressed by Dickens at the beginning of a work be accepted without ascertaining whether a later and totally opposite opinion is not in existence. It seems almost impossible to believe that Dickens's exaggerated account of the discrepancy between the Mrs. Pipchin of the text and the illustration can apply to the plate now in existence. He says (Forster's "Life," p. 326): "In the commonest and most literal construction of the text, it is all wrong. She is described as an old lady, and Paul's 'miniature armchair' is mentioned more than once. He ought to be represented sitting in a little armchair down in the corner of the fireplace, starting up at her." The text actually says ("Dombey," p. 75):—"Mrs Pipchin was a marvellous ill-favoured, ill-conditioned old lady, of a stooping figure, with a mottled face, like bad marble, a hook nose, and a hard grey eye, that looked as if it might have been hammered at on an anvil without sustaining any injury. . . . At this exemplary old lady Paul would sit staring in his little armchair by the fire for any length of time. . . . She would make him move his chair to her side of the fire instead of sitting opposite, and there he would remain in a nook between Mrs. Pipchin and the fender with all the light of his little face absorbed into the black bombazene drapery." These words, and these words alone, are all the directions in the text from which the artist had to work. In the illustration Mrs. Pipchin is represented as an old lady, with a prodigious hook nose, a false front, and huge cap. She is seated by the fire in a stooping attitude, a pair of attenuated ankles showing beneath the edge of her black dress. Paul is seated in a little armchair between her and the fender, staring in a sad, wistful manner at the Gorgon-mask. The drawing is not one of the best in the book, but it would be difficult to imagine a more accurate rendering of an author's description, so far as that description is conveyed in words. In the commonest and most literal construction of the text it is all right. The suggestions for Dombey (reproduced by Forster and Mr. Kitton) are evidently a quarter of an

hour's work with a pencil on half a sheet of note-paper. Four have been distinguished by arrows by the draughtsman as those most probably in accordance with the author's conception. The Dombey actually etched seems to have particularly pleased Dickens. He says ("Forster," p. 336): "I think Mr. Dombey admirable." His delight in the illustrations as a whole was, as a matter of fact, very great, and was expressed (doubtless with some characteristic exaggeration) so forcibly that my father gave him the original designs, which were acknowledged in the following letter:—

Devonshire Terrace, Thirteenth June, 1848.

MY DEAR BROWNE,—A thousand thanks for the Dombey sketches, which I shall preserve and transmit as heirlooms.

This afternoon, or Thursday, I shall be near the whereabouts of the boy in the flannel gown (a picture of little Paul painted as a present to C. D.), and will pay him an affectionate visit. But I warn you now and beforehand (and this is final, you'll observe) that you are not agoing to back out of the pigmental finishing said boy, for if ever I had a boy of my own that boy is

MINE!

and as the demon says at the Surrey,

"I CLAIM MY VICTIM,
HA! HA! HA!"

at which you will imagine me going down a sulphurous trap, with the boy in my grasp—and you will please not to imagine him merely in my grasp, but to hand him over.

For which this is your warrant and requirement.

(Signed)

CHARLES DICKENS.

Witness—WILLIAM + TOPPING,

His groom.

The Dombey illustrations may be left to speak for themselves. They have the shortcomings inevitable in all work—literary or artistic—executed under the pressure of time and the drawbacks inseparable from periodical publication. They answer their purpose in a manner no other book illustrations have since done. But they show only one facet of Browne's inventive and versatile mind.

The committee of the Liverpool Art Club have succeeded in borrowing several hundred works in the shape of pictures, water-colour drawings, chalk and pencil sketches. The subjects cover a wide range—many didactic and allegorical, others broadly comic, a few landscapes, more than one series of illustrations (never published) to poems (e.g., Shakespeare's "Venus and Adonis"), sporting sketches, and social satires. It is proposed, as far as the liberality of collectors will allow, to illustrate all the methods of work employed, and to exhibit for the first time to the public those aspects of the artist's genius hitherto only known within a narrow circle.

THE ROYAL ACADEMICIANS AND THE BELT LIBEL CASE.

A LETTER has appeared in the *Times* from a Royal Academician, commenting upon the way the artistic evidence at that trial was dealt with. It would, he says, be difficult to conceive of a fairer opportunity than was then offered for the proper use of that class of evidence; while, perhaps, never was a body of uncontradicted testimony given by important witnesses more thoroughly discarded or more completely misunderstood than in the summing-up of the learned judge. The closing words of his lordship, as reported in the *Times*, are truly remarkable, for he is there found directing the jury that the "theoretic opinion" of the artists on the Pagliati busts must fall unless the direct evidence given by the witnesses who saw the plaintiff working on the first of the busts is disbelieved. In this direction his lordship left out of count the vital facts that the sum of hours sworn to amounted to only a small portion of the time the bust was in progress, and that the artists gave their opinion not upon a part but upon the whole of the work that was found upon the bust. Others will doubtless deal with this direction on its technical side, but on my part I crave from you permission to say something of the lesson we have learnt during this trial of the treatment of artistic evidence can receive in an English Court of Justice, when the verdict of the jury had to turn upon a question of artistic capacity. To explain this treatment I have no need to travel over the whole case, and I will limit my remarks to the incident of the Pagliati busts.

It will be in the remembrance of your readers that the plaintiff was permitted, and even encouraged, by the learned judge to model a test bust during the progress of the cause. It was certainly desirable that there should be one spot of firm ground to rest upon amid all the quicksands of the case, and this would be secured by a bust being modelled by the plaintiff under supervision. This bust gave, in a form that could not be disputed, the characteristics of his own proper workmanship and the extent of his skill; and it became a standard against which his alleged workmanship could be tested. It will be seen that the judgment on the relative merits of the two busts had become a matter of the first importance, and so soon as the test bust was finished and delivered up, the defendant took a step to obtain a really authoritative opinion upon them, and to prevent the jury settling the question of artistic verification according to their own unaided instincts. Through his solicitor he

made a general raid upon the Academicians, and under the pains of the law he brought them into court. They did not appear as "experts" according to the usual acceptance of the word, for their opinions were not elicited before they entered the witness-box. The greater number of them knew neither the plaintiff nor the defendant, and they owed the unwelcome honour of the summons to the fact of their names being found on the roll of the Royal Academy. It would, therefore, be less misleading to call them assessors or advisers than to call them experts.

The problem submitted to them was simple enough. Side by side were two busts of the same size, and both had been done in clay. These had been executed within a few weeks of each other from the same sitter in the same attitude. The question was whether the same hand that had done the more recent bust had also done the earlier one. To the Academicians who have, as a routine duty, to verify works in their own schools, the question offered no difficulties; neither could it to any artist of capacity and experience. The answer given by every one of the witnesses was, in substance, that the earlier bust was much the finer artistic work, and that, besides the plaintiff's, some other and far more skilful hand had impressed the artistic excellence upon its plastic material.

On reviewing this part of the case, the jury had before them the direct evidence of several witnesses who had seen the plaintiff at work upon the earlier Pagliati bust, but the sum of all the hours accounted for in this way made, as I have already explained, only a small portion of the time the bust had been in progress. For what had happened during the larger portion of time the testimony of the artists was the jury's only guide, and this testimony, in effect, had shown that some other and more skilled hand must have worked on the bust during some of those many hours not accounted for to the jury. The artistic evidence was unanimous and uncontradicted and, whatever its weight, there was nothing to weigh against it upon the ground it occupied as its own. In summing up this portion of the case the learned judge made the following remark:—"While," he said, "I would if I were in doubt hear (the Academicians) and follow them, in a case where there is no doubt I would not yield my own experience to any number of Academicians, distinguished though they be." In these terms his lordship paid the Academicians the compliment of saying that if he were in doubt upon a question of artistic authorship, he would listen to and follow them. But I will ask, why did his lordship allow and encourage the test bust to be executed, at the risk of degrading his court to the level of a performer's platform, if there was not a doubt about the authorship of the first Pagliati bust, and, indeed, of most of the other works in the court?

The best explanation of the summing-up is to be found, as I believe, in the low estimate Mr. Baron Huddleston has formed of the critical faculty of artists in the matter which is the occupation of their lives (especially if they happen to be, not amateurs, but only professionals and Academicians), and in the uncertain acquaintance his lordship probably has with the conditions of art workmanship. It would appear that his lordship rests in the belief that when a sculptor has been seen at intervals working on the clay, proof has been established that all the work, or all the more valuable part of it, must be credited to him. Obviously he does not see that, when there are great gaps in the direct evidence, the testimony of a capable judge, who looks into the work at its finish, has a great value of its own. The critical judgment is given, not upon a part, but upon the whole of the labour bestowed upon the work, and the impress on the plastic material of superior knowledge and of a master hand is pretty sure to be detected although no stranger eyes saw the hand at work. The very complexity of a piece of art workmanship, and the infinity of its autographic signs, multiply the means of detection, and when experts are listened to with deference when so simple a thing as a signature is in question, it would seem only reasonable to receive a class of testimony where detection is far more sure. That it should be jealously watched is only right, and when it is conflicting its weight must suffer, but in the trial which has just closed the testimony on the Pagliati busts, given by the chief artists of the country, was unanimous and uncontradicted, yet it received from the judge the treatment to which I have drawn attention.

Mr. G. D. Leslie, R.A., writes:—It was my privilege during the latter years of Sir Edwin Landseer's life to assist him occasionally in the execution of his pictures. Now, to take one of these as an example—viz., *The Fight between the Eagles and Swans*, I have no doubt every one of my distinguished brother Academicians would be ready to take oath that the work was not mine, notwithstanding which I should, according to the ruling in the late trial, have been entitled to a verdict in my favour if I claimed the authorship, for I could, on the one hand, produce five or six important witnesses who could have sworn to having seen me at work on the picture—Sir Edwin himself would have done so. Sir Francis Grant, Miss Landseer, and several others, besides Sir Edwin's servants, must have given direct evidence to support my claim; and, on the other hand, Sir Edwin could not have produced a single witness who could swear to having seen him actually painting on the work, as, from his nervous temperament at the time, he would never allow anyone to watch him at work. I need not add that I lay no claim to the picture in question, for in my absence Sir Edwin

would invariably go over with his facile brush the parts on which I had worked. As it may excite the curiosity of my brother artists to know on what parts of Sir Edwin's picture I worked, I may state that they were the rushes and waterlilies.

"INK PHOTO."

THE three plates in the present number have been reproduced from the original drawings by the new process in photolithography recently introduced by Messrs. Sprague & Co., 22 Martin's Lane, Cannon Street. It may now be said to have fairly shown its great merits and advantages, and to have conclusively disproved the hitherto universally received opinion that photolithography could not be produced from water colours.

The first example of this process that was published was issued by us early in 1881, since which date we have given numerous plates taken from water colours exhibited at the Royal Academy, &c., oil paintings exhibited at the Salon, drawings in crayons, and photographs.

The process has excited much interest among practical photographers and scientists. One of the photographic journals says:—"The 'Ink Photo' process of Messrs. Sprague & Co. has much to recommend it. In the first place, it is far cheaper than any other mechanical process which will reproduce a photograph from nature, and secondly it admits of the most rapid printing."

In preparing drawings for reproduction, it should be borne in mind that blues do not photograph. All blues used for shadows and skies should have lamp black or indian ink mixed in with them. Bright reds and chromes come out very dark. Ink outline can be used with washed shadows, &c. The two plates by Mr. Ernest George which we published lately are good examples of this style. Drawings made in sepia or black can be relied upon to give a true result. Several plates taken from water-colour drawings and photographs have been completed for us by Messrs. Sprague, and will be published from time to time.

FIRES IN THEATRES.

DURING the past year there have been no less than forty-one theatres destroyed by fire. The following is a list of them, with the dates of the fires:—Jan. 6, 1882, Owensburg, Ky. U.S., the Opera House; Jan. 16, Monkato, Minn., United States, Opera House; Jan. 19, Bucharest, Circus Kremser; Jan. 31, Sofia, Theatre in Government House; March 8, Richburg, New York, United States, Baum's Opera House; March 17, Marseilles, Crystal Palace Theatre; March 18, St. Petersburg, Theatre Winter, Livadia (commenced during representation); March 20, Minesota, Texas, United States, the Opera House; March 20, Algiers, National Theatre; March 21, Middleport, New York, United States, Compton's Opera House; April 1, Portsmouth, Ginnett's Circus; April 9, Red Wing, Minn., United States, the Opera House; April 14, Titusville, Penn., United States, the Opera House; April 15, Bolton, the Temple Opera House; April 16, Schwerin Hoftheater (commenced during representation); April 17, Pernaut, Bürgerclub-theatre; April 21, Hagen, Theater-Saal; April 24, Franklin, Ind., United States, the Opera House; April 25, Portsmouth, the Princess's Theatre; May 7, Nevada, Mo., United States, Moore's New Opera House; May 19, Leadville, Col., United States, Academy of Music; June 26, Riga, the German Theatre; July 4, St. Petersburg, Arcadia Theatre; July 6, Madrid, Teatro de los Recreos; Aug. 29, Red Oak, Iowa, United States, Bishop's Opera House; Sept. 1, Staraja Russa, Summer Theatre; Sept. 5, London, Philharmonic Theatre; Sept. 11, Louvain, Theatre Beriot; Sept. 13, Tambov, Russia Theatre; Sept. 26, Orebroe, Theatre (commenced just before the representation); Oct. 8, Brighton, Mellison's Theatre; Oct. 26, Salem, Oregon, United States, Reed's Opera House; Oct. 30, New York, Abbey's Park Theatre; Oct. 31, Barcelona, Teatro Massini; Nov. 1, New York, Alhambra Theatre; Nov. 3, Baltimore, Arlington's Variety Theatre; Nov. 12, Frankfort, Ky., United States, Major Opera House; Nov. 16, Wloclarock, the Theatre; Nov. 28, South Shields, the Westend Theatre; Nov. 30, Metropolis, Ill., United States, the Opera House; Dec. 6, London, the Alhambra Theatre. Total fires from Jan. 1 till Dec. 6, 1882:—In the United States, 17; England, 7; Russia, 5; Germany, 4; France, 2; Spain, 2; Belgium, 1; Sweden, 1; Bulgaria, 1; Roumania, 1:—41.

ROYAL ACADEMY ARCHITECTURAL SCHOOL.

The following students have been lately admitted:—

Upper School.—R. T. Bloimfield, B.A., A. Hemingway, J. A. Slater, W. Toogood. *Lower School.*—F. S. Capon, A. Forrester, W. J. Gibbon, J. Muller, F. P. Oakley, S. Russell, J. E. Sears, J. Thompson, W. F. Young. *Probationers.*—C. H. Aitken, W. Brown, S. R. Clemence, E. L. Conder, Arthur Crow, E. Guy Dawber, A. Dovaston, R. M. D. Fell, Frank Fox, L. Littlewood, E. Herbert, C. S. Hornabrook, W. C. Jones, F. W. Lane, Henry Ling, W. E. Lymington, C. E. Malloes, J. C. S. Mummery, A. B. Pite, S. H. Seager, W. A. Thompson, J. M. Townsend, H. J. Westell, C. F. L. Yonge.

NOTES AND COMMENTS.

SEVERAL young artists have been lately victimised by means of an exhibition in Bond Street, which from a similarity in the name was identified with a gallery that was fairly conducted. A few days ago a lady artist summoned a pawnbroker for detaining an oil painting belonging to her. It was received from a man who was in the habit of pledging and redeeming pictures, and represented himself to be a picture-dealer. The man appears to have been in reality the British Fine Art Gallery. Several other artists were ready to claim their pictures, of which they had been deprived under like circumstances. The pawnbroker expressed his willingness to give up the pictures, and indeed he is not blameable; but as there is some legal point to be discussed the magistrate's decision was not then given. The case suggests the difference between supply and demand. Although there are so many galleries in London there are more pictures than they can hold, and people with assurance have no difficulty in finding works to exhibit. In some instances a fair price is obtained for those works, but generally speaking they become subjects for a sordid traffic which few men or women care to reveal.

REPUBLICAN France would seem to believe in the theory that the State shares proprietorship in the goods of the citizens. By virtue of the theory the Louvre has been enriched by a valuable collection. M. TIMBAL possessed so many fine things that collectors were looking forward to the sale which was to follow his death. But the officials of the Louvre were beforehand. They addressed the Minister of Public Instruction and the Fine Arts, beseeching him to prevent, if possible, the dispersion of so much artistic riches by coming to an understanding with Madame TIMBAL, whereby the collection could be secured to France. The Minister gave the authority, and the officials of the Louvre very soon concluded the negotiations with Madame TIMBAL, who of course is said to have cordially reciprocated their patriotic intentions. And in this way the museum secured, at a price which is relatively modest, a precious collection. There are some people who would like to see the introduction of the system into this country. The officials of the National Gallery or the British Museum would be competent to make the bargains, but it may be doubted whether an English widow would cordially reciprocate their satisfaction in carrying off her property on modest terms.

THE fall of the chimney at Bradford, by which over fifty people were killed, is one of those terrible catastrophes which sometimes occur about the commencement of a year. As the subject has yet to be investigated, it would be premature to say whether the collapse of the chimney was caused by defective construction. The public may be assured that the report which is to be presented to the Home Secretary will explain the case to the fullest extent that is possible. Lieut.-Colonel SEDDON, who has been appointed to conduct the investigation, is a master of constructive science. The articles by him in this journal are suggestive of an unsurpassed knowledge of building materials and attention to details. It may be difficult to ascertain the history of the chimney, and when the defects originated. But it is not unlikely that in this case, as in many others, the repairs which were undertaken were not directed by an architect. An absurd notion prevails that a so-called "practical man," with his empiric stratagems, is the best resource in case of danger, and the consequences are often fatal.

ART has lost many well-known representatives during the past year. Among the departed are Mr. DANTE G. ROSSETTI, painter and poet; Mr. EDWARD DUNCAN, the water-colour artist; Sir DANIEL MACNEE, the President of the Royal Scottish Academy; Mr. JOHN LINNELL, the landscapist; Mr. LEWIS GRUNER, artist and decorator; Mr. THOMAS J. BARKER, whose pictures were more popular than the works of abler men; Mr. HABLOT K. BROWNE, "Phiz"; Mr. WILLIAM B. FYFE; Mr. CECIL G. LAWSON, who had a great career before him; Professor FRIEDRICH DRAKE, the sculptor; Mr. FRIEDRICH WEBER, Swiss sculptor; Mr. WILLIAM MILLER, the Scottish engraver; Mr. EDWARD B. STEPHENS, A.R.A., a sculptor whose works were much admired in Devonshire; Dr. JULIUS HÜBNER, of Dresden; Mr. CYRIL HERBERT, the son of Mr. J. R. HERBERT, R.A. In architecture, fortunately, the losses have not been so great as in other branches of art.

A COUPLE of days before the opening of the last Salon, and while the Hanging Committee were busy in measuring pictures to fill the vacant spaces on the walls, the late M. GAMBETTA entered the galleries. All labour was suspended, and he was received in a way that suggested how great a power he was in France. M. GAMBETTA went round the rooms, escorted by the Committee, and as he passed along he indicated the good and bad points of many of the pictures. In his student days he was an admirer of MILLET, and those works in the Salon which represented peasant life received some attention from him. But it may be interesting to record that the painting which appeared to give M. GAMBETTA most delight was the *Mise au Tombeau*, by CAROLUS DURAN. It is probable that he cared little for scripture subjects, but as a Southern he was fascinated by the magnificent sky which was shown beyond the sepulchre, and the splendid hair of the Magdalen.

MR. HOLROYD SMITH, C.E., has described a mode of repairing a factory chimney, which he adopted with success. The foundations of the chimney were giving way, and, upon examination, he found it was built upon an arch, and the springers on one side were crumbling. The owners and the builders feared it would be necessary to take the chimney down and rebuild it, but Mr. SMITH avoided that expense by putting in four foundations outside the base of the chimney and erecting pillars thereon. Then, by fixing a buttress against one side, he was able to cut out a space for the insertion of an iron beam, the ends of which rested upon two of the pillars. The same process was repeated on the other side, and the two remaining sides were supported by transom beams resting upon the main beams. This done, the original arch upon which the chimney stood was removed, the whole weight being supported by the four iron pillars, leaving plenty of room for connecting the flues, with the further advantage that the heat of the flues, which in this case was excessive, had no effect upon the foundations. If new chimneys, and especially large ones, were built upon this principle, they would be much safer structures than ordinary ones. The four pillars would make an extended base, ensuring the stability of the chimney, and should any of the foundations show signs of subsiding the weight resting upon any corner could easily be supported by cross beams during the repairs.

THE Central Tower of Peterborough Cathedral having lately appeared to be in a most dangerous condition, Mr. J. L. PEARSON, R.A., was summoned by the Dean and Chapter, and on Wednesday the work of taking down the tower was commenced. A committee has been hastily formed, consisting of the Marquis of EXETER, Earl FITZWILLIAM, M.P.; Hon. J. W. FITZWILLIAM, M.P.; Lord LILFORD, and others, and subscriptions have already been received with a view to restoring the tower. The work is estimated to cost about 40,000*l*. Settlements are not uncommon in the history of the cathedral. It is built upon a thin crust of oolitic shale lying upon blue gault, and only a few of the piers have been brought down to the lower bed. The great piers under the tower on the eastern side settled when the Norman tower existed, and thus affected the triforium and clerestory arches. The existing lantern was consequently made as light as possible, and hoods were inserted to take the weight off the north and south arches. The walls were made thin; and when they were scraped some years ago it was evident that they had been cracked for a long period. The necessity of restoring the tower has been evident, but the Dean and Chapter have not been able to collect the requisite funds.

A PENNY PLAN may not at first sight attract much notice but the experiment which has been made by Mr. F. S. WALLER of producing a plan of Gloucester Cathedral is deserving of attention. His sheet contains a ground plan and plans of the crypt and triforium, all clear and accurate. There are also notes, which are a key to the different styles represented in the building. The plans are folded in a neat wrapper containing a good view of the front of the building. Although sold for a penny it is expected that the price will produce a profit, which is to be devoted to the Restoration Fund. The experiment is deserving of success, and it would be an advantage if Mr. WALLER's example were imitated in the other cathedral towns of England.

ILLUSTRATIONS.

DESIGN FOR A PORTION OF A PROPOSED DECORATION IN
ST. PAUL'S CATHEDRAL.

BY the kindness of Sir FREDERICK LEIGHTON, P.R.A., we are enabled to reproduce the design by him forming part of the proposed decoration of St. Paul's which appeared in the last exhibition of the Royal Academy. It will be remembered that Mr. POYNTER, R.A., contributed to the same exhibition a large drawing representing a segment which comprised one-sixth of the dome, and from which the proposed arrangement of the decoration could be understood. The dome will be divided into eight parts by upright architectural ribs. In each space between the ribs will be two large round panels, 20 feet 8 inches and 12 feet 8 inches in diameter respectively. Round the base of the dome and supporting the circular panels will be eight thrones or architectural seats, containing figures of St. JOHN the EVANGELIST and the Bishops of the Seven Churches. In a circle above all will be the Four-and-twenty Elders. The group of figures on the ribs will illustrate the chorus of praise to the Lamb.

The circular panels and medallions will contain the Visions of the Apocalypse. In the segment which was exhibited the upper panel represented the Vision of CHRIST in Judgment, and the lower panel (shown in the illustration) the Rising of the Dead from the Sea. The subjects of the two are taken from the eleventh, twelfth, and thirteenth verses of the twentieth chapter of the Revelation :—

And I saw a great white throne, and Him that sat on it, from whose face the earth and the heaven fled away ; and there was found no place for them. And I saw the dead, small and great, stand before God ; and the books were opened : and another book was opened, which is the book of life : and the dead were judged out of those things which were written in the books, according to their works. And the sea gave up the dead which were in it.

No words of ours are necessary to point out the imaginative power and mastery of the human form shown in the design. It will be a great day for English art when a panel, which is worthy of a place in the Sistine Chapel, will, with the remainder of the series, be completed on a scale and in a material which will be worthy of them.

NEW LEADENHALL MARKET.—1. EXTERIOR VIEW. 2. INTERIOR VIEW.

THE Corporation of London must be credited with a desire to perpetuate the traditions of the City, and in consequence there is much which is suggestive of Old London in the midst of arrangements which are adapted to the requirements of the present time. On the Continent it only requires the possession of sufficient funds in order to make everything new, for the Haussmanising which has transformed Paris is but an example on a large scale of what has been done in other places. London cannot escape the inevitable law of change, but wherever it has been possible the Corporation have endeavoured to preserve the associations, however great may be the alterations. The new Leadenhall Market is a case in point. A market has stood there for centuries, and the buildings which have been lately constructed will allow of a continuation of the business for many centuries.

The history of Leadenhall extends back to the beginning of the fourteenth century. In 1309 the manor belonged to Sir HUGH NEVILL, and after his death his widow made a feoffment of it and of some church advowsons to the Earl of ARUNDEL and SURREY. HUMPHREY DE BOHUN, Earl of Hereford, possessed the manor in 1384. RICHARD WHITTINGTON and other citizens of London were enabled to secure the manor with the appurtenances and advowsons in 1408, and three years afterwards the property was made over by them to the mayor and commonalty of London.

About 1445, a famous and mighty citizen (*cum nobilis et potens vir*), SIMON EYRE, upholster and draper, resolved to erect a granary in Leadenhall. "He built it," says STOW, "of squared stone, in form as now it showeth, with a fair and large chapel in the east side of the quadrant, over the porch of which he caused to be written *Dextra Domini exaltabit me.*" The granary was covered with lead, which in those days was considered to be an unusual kind of roofing for such building, and in consequence gave the name to the place. SIMON EYRE died in September 1459. In 1466 EDWARD IV. granted a licence of the chapel to a fraternity of the Trinity (an order that no longer exists), and in the forenoon of every market-day

Divine Service was celebrated for the market people. Once a year, says STOW, they all met together and had solemn service with procession of the brethren and sisters. The chapel escaped the Great Fire and survived until 1812, when it was taken down. It was a small Perpendicular building of good proportions. A view of it appears in WILKINSON'S "Londina Illustrata."

There was a fire in the market in 1484 which caused much damage. The citizens of London in 1503 petitioned HENRY VII. to have an order made that Frenchmen and other foreigners should be compelled to bring their wares to the open market of the Leadenhall. The hall was also used for the storage of grain, but through some negligence the quantity was allowed to be diminished, and in 1512 there were not a hundred quarters of wheat in all the City granaries. The bakers' carts from Stratford were in consequence daily surrounded by an excited crowd. But an energetic mayor, ROGER ASHLEY, was elected, who quickly secured an ample supply of wheat in Leadenhall. He was accustomed to visit that market at four o'clock in the morning in summer, and from thence he visited the other markets.

Soon afterwards there was some discontent among the citizens in respect to the management of the market. A petition was presented to the Common Council in 1519 in which it was suggested that Leadenhall should not be farmed to any person or persons, fellowship or company. The hall was described as the best place for the citizens to meet in case of a tumult, and in it the arms were stored and the timber for the reparation of the City property. By letting the hall EYRE'S stipulations were disregarded, and finally it was stated "if the said place, which is the chief fortress and most necessary place within all the City, for the tuition and safeguard of the same, should be letten to farm out of the hands of the chief heads of the same City and especially to another body politic, it might at length by likelihood be occasion of discord and debate between the said bodies politic, which God defend." What was the effect of the petition is not stated by STOW. But it may be assumed that the building was considered to be too good for an ordinary market. In 1534 it was proposed to convert Leadenhall into a Merchants' Bourse, but after much discussion it was resolved to keep the Bourse in Lombard Street. JOHN STOW was born in the parish of St. Michael in 1525, and he gives the following description of the market as it was in his youth, that is, about 1535 :—

In a part of the north quadrant, on the east side of the north gate, were the common beams for weighing of wool and other wares, as had been accustomed. On the west side of the gate were the scales to weigh the meal. The other three sides were reserved for the most part to the making and vesting of the pageants showed at Midsummer in the watch. The remnant of the sides and quadrants were employed for the stowage of wool-sacks, but not closed up. The lofts above were partly used by the painters in working for the decking of pageants and other devices, for beautifying of the watch and watchmen. The residue of the lofts were letten out to merchants, the wool-minders and packers therein, to wind and pack up their wool.

The market was afterwards used for the sale of meat and fish, as well as hides and wool. "Leadenhall Market," says PENNANT, "is the wonder of foreigners, who do not duly consider the carnivorous nation to which it belongs. When DON PEDRO DE RINQUILLO, the Spanish ambassador, visited Leadenhall he told CHARLES II. with admiration that he believed there was more meat sold in that market than in all the kingdom of Spain in a whole year." As the market was partly rebuilt in 1730, it may be assumed that no part of the early buildings was in existence when the City Council resolved to erect a new market, which is shown in the illustrations.

The new market and avenues occupy an area of about 26,900 superficial feet. The avenues are 30 feet wide, and have been laid out so as to form a cross. The four entrances are west into Gracechurch Street, north into the new street now called Whittington Avenue, east into Lime Street Passage, and south into the site of the old gangway of Leadenhall Market leading into Beehive Passage. The avenues are roofed over on the principle which has been successfully adopted in nearly all the metropolitan markets, and which may be described as an adaptation of the Mansard principle. The tall sloping sides are at an angle of about 60 degrees, and are about 9 feet high, supporting an ordinary king-post truss. Any lateral thrust which might arise is obviated by segmental laminated ties. The sloping sides are filled in with glass louvres some 7 inches or 8 inches apart, and sloping at an

angle of 41 degrees, so that there are always two thicknesses of glass for any sun ray to penetrate, stopping the heating ray from passing through the second glass, and thus, even if the sun is hot, inducing a current of air to pass between the *louvres*, and out on the other side where it is in shade.

At the intersection of the two avenues is an octagonal space surmounted by a dome 52 feet in diameter, and the top of the dome is 67 feet from the level of market. A large proportion of this dome is also filled in with glass *louvres*.

There are thirty-one shops in the market, including one public-house. The frontages vary from 14 feet to (in one case) 162 feet. Each shop has a basement, ground, first, and second floor, and they vary in size from 240 feet area to about 1,590 feet area. The shops are 16 feet high, the ground floors and first floors are lighted from the arcade, and, though thoroughly well lighted and ventilated, are protected from the inclemency of the weather. The basements of the shops are 13 feet high, and, being well lighted and ventilated, are adapted for the storage of provisions. The interior of the market is light, airy, and cheerful, the ornamentation and decoration being judiciously treated.

The principal entrance is from Gracechurch Street, and the style of architecture adopted is Flemish Renaissance, executed in Portland stone and red brick.

The contract for the works was signed on October 23, 1880, and the market was opened by the Lord Mayor in full state, accompanied by the Sheriffs, on December 15, 1881. The total cost of the building, fittings of shops, &c., complete, has been about 70,000*l*.

The market has been executed from the designs, and under the superintendence, of Mr. HORACE JONES, the City Architect, President of the Royal Institute of British Architects, and is the fifth market he has built in the City. The illustrations are reproductions of water-colour drawings which were exhibited at the Royal Academy.

The contractor was Mr. B. E. NIGHTINGALE, Albert Embankment.

The following is the inscription on the foundation-stone:—

THIS STONE

Was laid on the 28th day of June, 1881,
in the Mayoralty of

The Right Honourable WILLIAM MCARTHUR, M.P.,
BY

HENRY AARON ISAACS, Esq.,
Chairman of the Markets Committee
of the Corporation of the
City of London,
assisted by

HENRY LOWMAN TAYLOR, Esq., J.P., Deputy,
Chairman of the
Central Markets Sub-Committee.

Architect. Builder.

PAGAN AND CHRISTIAN ARCHITECTURE.

AN address was delivered lately by Mr. Gambier Parry at the annual meeting of the Gloucester Art School. He said:—The most novel and pronounced advance of our pupils is in relation to architectural modelling and design, by which a gold and bronze medal have been gained, to the honour of the school. I will therefore, with your permission, address the few remarks which you always expect from me on these occasions to the general aspect of that subject, and the special interest of it to thoughtful pupils. As years roll by it will be for those pupils who make this branch of art the object of their profession to consider whether to adopt any one special school of art that it embraces, whether Classic, Renaissance, or Gothic, or to take a broad and more independent course. It is impossible to force a taste on any one, and foolish to attempt it; for where success is the goal, the course must lie along the line of natural feeling. But however that may be, let the pupils remember that the purpose of architecture is to serve human life. Architects have before now made men's lives miserable by submitting their homes to some unfortunate idea of an architectural necessity; thus making them rather the slaves than the masters of their houses, darkened to suit the proprieties of some classic cornice, or lowered to meet the scientific proportion of some row of columns, or worse and more costly, where the internal arrangement of the house has been sacrificed to some wretched necessity of the balance of parts in the external elevation. Our individual tastes in such matters are so much affected by habit and association, that it would be hard to force one style for universal adoption. So the best course for a student is to master the character and capabilities of the art in its different phases, and then to concentrate himself on that which is most congenial to him. I

confess to the inclination to make nationality the principle of my choice. Some good reason, whether of climate, social habits, or geographical position, must have underlain the development of a national art—besides which, the very sense of congruity would make it preposterous to build a Gothic house or church on the plains of India, or a pagoda at Charing Cross. Each country seems to demand particular forms. What need of towers and spires, lofty roofs or gables, to adorn the rich and varied scenery of Greece? But what would English towns or country be without them, to break the dull monotony of their skyline? But beside those material and evident qualities in styles, there is also an undefinable sentiment and poetry about them which it is difficult to resist. It is enough to analyse their forms, and to leave without the rude touch of analysis the mystery of that charm which makes all good art dear to mankind. The architecture which grew to an exquisite perfection under Pagan influences was the work of an age over which human genius may well glory. Like the other arts and poetry of that age, it was the expression of a divine afflatus, which ever moves within men's breasts. True arts are nourished by the circumstances of national life, and perfected by their consistency with it; and pre-eminently so is architecture, which is the centre and home of them all. Such was the origin of our national architecture, as different in its result from classical art as sunny or cloudy skies, or Christianity and Paganism, could make it. A Pagan temple is a thing of exceeding beauty—a perfect result of construction and proportion artistically and scientifically combined. It is a thing of beauty, coldly intellectual. As a temple it needed no element of upward thought; for the god was there, or there sufficiently in his grand sculptured figure, to receive the prayers and adoration of the people; but the church of the Christian assembly is but the first step of that flight which leads upwards to the Throne of Divinity elsewhere. That work of Pagan art extorts admiration; but it is too regular, too exquisitely artificial, to arouse sympathy. There seems to be no touch of nature in it. Compare two such typical examples as Fountains Abbey and the great temple of Pæstum, both rising from the plain of their foundations, in the silent grandeur and beauty of ruin; but with this marked difference, that the Gothic fane seems to spring up and grow like a plant from the nature which surrounds it; while the Pagan temple stands isolated in its own dignity, a creation of human intellect, to which the God of Nature is unknown—grand, silent, and alone. I lay down no law for the taste and impressions of others, but I speak only of my own, which may be right or groundless; but at least the apparent ground on which my impression is based is this—that the very essence of the beauty of classical architecture lies in the elements of unity and equilibrium, qualities which are the very opposite to those which characterise human life; whereas the Christian or mediæval art was free, faulty, impulsive, irregular, a compound of simplicity and aspiration. The classic architecture represented human life such as the dignified self-restraint of a cold philosophy would have liked to make it; whereas the Christian symbolised it as it is. Be this as it may, the two contrasted forms of architecture equally afford this grand lesson to the student, that they were both the creations of natural growth; they were arts that responded to the national spirit; no products of spasmodic exertion; neither made nor marred by sudden flights of genius or conceit; but creations which matured knowledge and disciplined imagination had combined to bring to their perfection. There is no temper of an artist's mind more sure to lead him downwards than that which strains for novelty. Without play for inventive imagination no artist can exist; but the play in this, as in most other games, is like to be best by the player who knows most about it. There may have been those who, by the impulse of strong and admirable feeling, may have carried their art to fair results: but look at the lives of all great masters, and you will find, most truly indeed, that *poeta nascitur, non fit*, that genius is heaven-born; but that with that genius as the guiding light and vital fire, the humility of study has been their surest stepping-stone to the grandeur of their success. The best education of an architect is in the mastery of those great principles which underlie all arts, in form and colour; repetition and contrast, mass and proportion, breadth and detail. Then let him take to the specialities of his art; and though the ruler and the compass, which chill and stiffen the work of other men, be among his necessary tools, they will be to him the pliant exponents of his well-stored thoughts. It has been for want of such broad education of this that the eyes of our people have been inured to ugliness; and with their vision distorted by habit they have been content to mistake vice for virtue, and to dignify deformity with the title of the picturesque. Art will repay the study of those who love it; but just as a man approaches it, it will prove a rock to stand upon or to wreck upon, for the eloquence of artistic expression is equally available for all his motive impulses, for honour or for dishonour, as his use of it may be. But fine art tends upwards to purity, for although its study is upon material things, and its illustrations are drawn from the realities of life, or the landscape of external nature, its effect is to deepen thought rather than to satisfy it with the interest or beauty of their outward show. If, then, the mind of the student be so—and then happy

will he go along his path of work and duty—he will come to see how deep the analogies, how close the relationship between the material things and the teeming life around him; how imperishable those which seem most evanescent; how colours fade only to return more beautiful; how things that droop and die appear again, as though to force on him the conviction that individuality is eternal. And thus turning towards himself, his cultivated taste, his gifts of sense, of intellect, of genius, will be seen no more as the end and object of his life, but as the means and power toward that end, which is the nourishment of his inner self, his spiritual nature. His art is still his delight, in all its knowledge and all its skill; but his estimate of it deepens as his thoughts deepen for all else beside. He grows to value it rather for what it contains than what it is; less for its technical and material success than for that fire inextinguishable which gleams from within it. The touch of fine art illuminates his world; but it is her spirit that is the friend and companion of his life.

THE EDUCATION OF BUILDING WORKMEN.

A LETTER has been published by the President of the National Association of Master Builders of Great Britain. The builders of England are, he says, fully alive to the necessity of properly and systematically training the young workmen; and have discussed the matter at the meetings of the National Association of Builders. A paper was read by me at the annual meeting of 1881, pointing out the great disadvantage of the slip-shod way of acquiring knowledge (?) by the workmen of the present day, and strongly recommending the masters to improve the trade by reverting to the old-fashioned plan of taking apprentices. The association drew up and distributed a form of indenture, and I am glad to say that there is every prospect of success. The only difficulty which we have at present experienced is with regard to the term of service. The old system of serving seven years, living with the master and receiving low wages, is not now practicable. I propose that boys, while they are boys, should have only very low wages, but in the last year of the term, and when they are becoming useful, they should be paid much higher wages—in fact, nearly as much as a mechanic. They will thus be induced to serve faithfully to the end of their indentures. I think five years is long enough now that boys are better educated. Much has been done and much more might be done by the City companies, especially those which represent the manual trades such as the carpenters, joiners, masons, plumbers, plasterers, and others. The Tilers and Bricklayers have, for some years, at my suggestion, given premiums of 25*l.* each to masters willing to take boys. The scheme has met with tolerable success, but not all that we could have wished; we shall hope for better in the future. That a great want of competent tilers and bricklayers exists was felt when the Queen Anne style was revived in England. Great difficulty was then experienced in obtaining men capable of carrying out really good work.

THE FITTINGS OF THE COURTS OF JUSTICE.

ALTHOUGH there has been no opportunity of using the new Courts in the Strand, yet complaints have been expressed by lawyers respecting the desks and seats. A barrister says:—"In the Courts of the Chancery Division which I have seen, the three front rows—*i.e.* the Queen's Counsels' row and the two first rows for the Junior Bar—consist each of eight or nine separate oaken seats, each seat being about 22 in. in breadth, and raisable at pleasure by means of a hinge at the back. In front of each seat is a slightly sloping desk or ledge of oak about 22 in. in breadth, and 12 in. from top to bottom. This ledge has the angles at its lower corners cut away in correspondence with the shape of the seat it faces, it draws forwards towards the seats 3 in., and then discloses an inkstand, and it is joined to the next desks on either side by the slips of oak in which it slides. There are no drawers for stationery underneath these desks, but only another (horizontal) ledge, about 7 in. wide. The other rows of seats are continuous, 12 in. in depth, and have in front of them continuous ledges, varying in depth from 9 in. to 4 in., but without any inkstands whatever, which will be found extremely inconvenient. What an unhappy leader with a dozen briefs and a corresponding number of 'authorities' will do under these circumstances I do not know. But I foresee in the raising and lowering of the oaken seats, and the snapping of the wooden slides when drawn downwards or pushed upwards, and the slipping off of books and papers from the sloping desks, a cause of noise and confusion and annoyance which it would be most desirable to avoid; while in case a learned counsel whose seat has been raised should omit to lower it, the favourite forensic effect of suddenly sitting down at the close of a peroration will often be sadly marred, even if it does not result in undignified disaster.

"What is really wanted is—for each of the first three rows a long, narrow, cloth-covered table, with a raised ledge for the ink-bottles (so as to keep them out of the way of books and papers), and drawers for stationery. The seats should be continuous and properly stuffed and covered, with access at each end, and also,

where it can be contrived, near the middle. This middle access is given in the old Courts to the Queen's Counsels' row (where it is almost indispensable) by means of raisable flaps in their table. The other rows should be provided with ledges, broad enough to rest a book or a set of papers upon, furnished with sunken ink-bottles and with a shelf underneath.

"These are the kind of fittings at present in use, and in Courts thus arranged, when only a few counsel are present, each can occupy as much room as he requires, while in case there are many they can manage to sit close. Anybody who has been in our Courts on motion day or on a petition day (when sometimes sixty or seventy petitions may be in the paper besides other business) will see the advantage of this system."

According to "A Solicitor," the seats for his branch of the legal profession are so narrow—about half the width of those provided for the Bar—as to be quite uncomfortable. The backs to them are quite perpendicular, and hollowed out by the panels so as to bring the projections at the top well into the neck. Sitting on these ledges with the back well bent and the neck pressed forward for any length of time will be very uncomfortable indeed. Why the seats were not made broader and the backs even and slanting backwards, like a pew in a modern church, I cannot understand, unless it was considered that under the recent reforms the proportions of the members of our branch of the profession would become so attenuated that more accommodation for them would be wasted.

THE BUILDING TRADES IN GLASGOW.

ACCORDING to the *Glasgow Herald* the building trade during the past year has been in a rather better position as regards work than in 1881. There have been linings granted by the Dean of Guild Court to the extent of 71,000*l.* more in 1882 than in 1881 which is the first turn of the tide since the years 1875-76. Besides, there is still a good deal of building going on in the Great Western Road and Pollock-shields districts, and in the outskirts of the city. Prices, however, have not improved, and profits are still very small. There is a great amount of competition for the work that has to be done, which keeps prices low. However, prospects for the new year are considerably brighter than they were this time last year. There are several large contracts coming out, such as the Municipal Buildings, the City and District Railway, Cathcart Railway, and extension of the Caledonian Rdlway in the East End, and other works which are being contemplated. Besides, some large contracts are already settled, among others the Midland Railway Stores at the corner of Graham Street and High Street, and the Inland Revenue Offices at the corner of George Street and North Frederick Street.

Roughly speaking, it is calculated that there are at least 500 bricklayers employed in and around Glasgow, and during 1882 they have been more steadily employed than in any year since 1877. The standard wage is 8*d.* per hour, which is 1*d.* per hour of an advance over 1881. This advance was obtained in June last. It is not thought that there are any men working below 8*d.* an hour; but as a number of apprentices were cast adrift during the depression of 1878-79-80, it is quite possible that there are instances where lower rates are accepted. The present wage also obtained in 1873-74; in 1875 the rate was 8½*d.*, in 1876 it was 9*d.*, and that rate continued till 1878, when a reduction took place to 8*d.*; in 1879 the rate was 7*d.*, and that rate was continued till June last. As far as can be gathered by our correspondent, who admits that he is not in the secrets of architects and measurers, trade in the new year promises to be as good, if not better, than in the past one. Although the weather of late has been unfavourable for outside work, building as a rule being suspended, still bricklayers are fairly employed, public work alterations, generally-carried out at this season, giving them an advantage over other branches of the building trades.

House joiners early in 1882 year began an agitation with the view of bringing about an increase in wages. Several meetings were held, but those attending the meetings thought it would be impolitic to press the matter to an issue, and no demand for an advance was made. The rate of wages for competent workmen is 7*d.* per hour, a few firms pay 7½*d.* to a good number of hands, while a large number of men are paid less than the standard rate of 7*d.* per hour. Trade was very steady during the past year, and the returns obtained by the society show that 1,561 men are employed in the house shops at present as against 1,565 in 1881 being about half the number that was employed about six years ago, during the height of the building fever. Edinburgh now employs 1,454 men, as against 1,696 in 1881 and 1,802 in 1880. In 1880 Glasgow had only 1,276, so that the increase in Glasgow during the two years is more than counterbalanced by the decrease in Edinburgh. Aberdeen has 194 and Dundee 56 fewer men than they employed two years ago; while Greenock finds employment at present for 591, as against 428 two years ago, being an increase of 163. Dumbarton has increased 98; from 180 to 278.

There are some signs of revival in the mason trade, which suffered more perhaps than any other from the collapse in the property market a few years ago. The ranks of the men in these

parts have been considerably thinned since then, and consequently those who have remained find pretty constant employment. But apart from that, there was more demand for labour last year than in 1881, and there are indications that the present year will be one of greater encouragement. During the past year wages were advanced to 7*d.* per hour, a rise of $\frac{1}{2}$ *d.* on the rate of 1881.

MEXICAN HOUSES.

A CORRESPONDENT of the *Times* writing from Mexico says:—"Springer, the capital of Colfax County, 716 miles from Kansas City, although surrounded by superior sandstone and some limestone rocks, at present consists of a few frame houses and some log shanties, interspersed with the true Mexican edifice, constructed of adobes, or bricks made of mud and water. The blocks, roughly cast in moulds, are usually about four times the size of an English brick, and are sun-dried. In this rainless climate these dried mud blocks are wonderfully durable; I have seen walls made of them 300 years ago still in good preservation. For the poorer class of Mexican dwelling, often about 16 feet by 12 feet, these adobes are placed usually singly, making a 10 inch to 12 inch wall, held together by a little mud-mortar. At an elevation of 8 feet to 10 feet, fir poles or rough-sawn timber are laid from the front to the back walls, some of them projecting, without any regard to uniformity, two or three feet, and proving useful supports for suspending a pig, tools, drying clothes, or even the baby in its basket. The walls are carried about a foot above the roof timbers, on which are generally tacked rough boards, covered with a grouting of several inches of mud and gravel, from which rain is run off by a few wooden spouts or merely by holes left in the wall immediately over the rafters. Many of the older adobes are without a window, and the doorway, without the superfluity of a frame, is sometimes closed as required by a buffalo hide or other curtain. A fireplace is not always provided, cooking often being done in a small beehive-like oven, placed outside. The internal arrangements of such a dwelling—thousands of which are met with throughout New and Old Mexico—are of the simplest description. In many of the poorer houses in remote localities the beds, if such they can be called, are of hides (laid on the clean swept dirt floor), conveniently shaken and folded away when the occupants are astir. Many are still without either table or chair, for which a few rough stools are sometimes substituted."

THE ELECTRIC LIGHTING ACT.

THE number of applications which are about to be made to the Board of Trade for provisional orders under this Act are upwards of 150, of which no fewer than 34 have reference to the metropolis. The Act empowers either local authorities or electric lighting companies to make application for provisional orders, but, with one exception, no notice of such intended application has been given by any metropolitan authority, the exception being the parish of St. Pancras. The whole of the rest of the applications are by electric lighting companies, of which number 27 are by the Brush Company. These include applications for the requisite powers in the Strand district, Camberwell, St. George's, Hanover Square; St. James's, Westminster; Kensington, East London, Lambeth, St. Giles-in-the-Fields, Chelsea, St. Martin's-in-the-Fields, Marylebone, Paddington, Islington, Hornsey and Highgate, Tottenham, Hampstead, Willesden, Finchley, Wandsworth, Newington, St. George the Martyr, St. Saviour's, the City, Clerkenwell and St. Luke's, Bermondsey and Rotherhithe, Hackney, Bethnal Green and Shoreditch, and Fulham, Chiswick, and Acton. The other companies applying for similar powers within the metropolitan area are Ferranti, Thompson & Co., who apply in reference to certain districts in Chelsea, and in St. John's, Hampstead; by the Pilsen Joel Company, in Holborn and St. Giles's, St. Pancras, and the City of London; by the Edison Company, in the City of London and Westminster; and by the Swan Company in the Victoria, South Kensington, Hanover Square, and Strand districts. The intended applications of the various companies for provisional orders and licences are to be opposed by several metropolitan vestries on the ground that the electric light as an illuminant is as yet in an immature state, and that under these circumstances it would be unwise to incur the expense of its compulsory introduction in any particular district. In the provinces the municipal and other local authorities in upwards of 40 of the large towns have given notice of their intention to apply for powers under the Act. Among other corporations who are applying for the requisite provisional order are those of Manchester, Liverpool, Brighton, Sheffield, Leicester, Nottingham, Newcastle-on-Tyne, Plymouth, Portsmouth, Bradford, Preston, Bolton, Oldham, Swansea, Leamington, Norwich, Warrington, Carlisle, Blackburn, Southport, Wigan, Halifax, Scarborough, Birkenhead, Rochdale, Stockton, and Darlington.

A Site has been granted at Port Said for the erection of an English church.

AMERICAN CITIES.*

The position and look of some of the American cities is very striking and stately. Cleveland by its lake, Cincinnati with the hills above its great river, St. Louis rising above its yet greater river, would hold no small place among the cities of the elder world. So would the federal capital as seen from the Potomac, if only the hideous unfinished monument could be got rid of. And it fills one with simple amazement to see the way in which a vast and stately city like Chicago has risen from its ashes. In that great city I could see or hear of nothing older than the fire, save a church-tower which showed the marks of fire at its angles, and a single detached wooden house of an antiquated type. This last suggested that Chicago before the fire was something widely different from Chicago after it. But on the whole the American city which struck me most was Albany. Rising grandly as it does on both sides of the noble Hudson, it suggested to me some of the ancient cities by the Loire. It has the advantage, rather rare in American cities but shared with Albany by the federal capital, of having one dominant building. The general look of the city carried me so completely into another part of the world that, if any one had come up and told me in French, old or new, that the new capital was 'le château de Monseigneur le duc d'Albanie,' I could almost have believed him. This state capitol at Albany—why cannot it have a more rational name, like the state-house at Boston?—finally settled, for me at least, a question which I had been turning over in my mind ever since I landed in America. This was, What ought to be the architecture of the United States? That is to say, What should be the architecture of an English people settled in a country in the latitude, though not always in the climate, of Italy? Should it be the Gothic of England or the Romanesque of Italy? There seemed much to be said on either side; my own mind was finally fixed by the teaching of experience, by seeing which style really flourished best on American soil. I found the modern churches, of various denominations, certainly better than I had expected. They may quite stand beside the average of modern churches in England, setting aside a few of the very best. All persuasions have a great love of spires, and, if the details are not always what one could wish, the general effect of the spires is often very stately, and they help largely towards the general appearance of the cities in a distant view. But I thought the churches, whose style is most commonly Gothic of one kind or another, decidedly less successful than some of the civil buildings. In some of these, I hardly know how far by choice, how far by happy accident, a style has been hit upon which seemed to me far more at home than any of the reproductions of Gothic. Much of the street architecture of several cities has very successfully caught the leading idea of the true Italian style, the style of Pisa and Lucca, the style of the simple round arch and column, uncorrupted by the vagaries either of the Italian sham Gothic or of the so-called *Renaissance*. In a large part of the Broadway of New York the main lines of the style—I speak only of the main lines, without committing myself either to details or to material—seemed to be very happily reproduced. The general effect of many parts of that long street struck me as just what the main street of a great commercial city ought to be. And there are some buildings of the same kind in Chestnut Street, Philadelphia, though there they alternate with other buildings of a very strange kind, whose odd fancies make us turn back to look with real satisfaction on the honest brick of Independence Hall. Some of the banks especially seem to have thought that the stumper they made their columns the safer would be their deposits. But it was the capitol at Albany which fully convinced me that the true style for America was the style of Pisa and Lucca. The building has a most successful outline; in its details it is a strange mixture of styles, not so much confounded together as used side by side. There are parts which I cannot at all admire; but there are other parts, those in which the column and round arch are employed, which certainly pleased me as much as any modern building that I have seen for a long time. When I say that the arches of the senate-chamber seemed to me, as far as their general conception goes, worthy to stand at Ragusa, some will understand that I can say no more.

I am almost afraid to add that I thought that some parts of the inside of the City Hall at New York were entitled to some measure of the same praise. For I found it hardly safe to speak of that building. Its name at once drew forth bursts of indignation at the millions of dollars which certain persons had contrived to gain for themselves out of its making. Politically, I felt abashed, as if I had somehow become a champion of corruption. Still, I could not help thinking that the columns and arches, of which alone I was speaking, were as guiltless of any offence as Sir Thomas More's beard. So, to come back to the capitol at Albany, I ventured to make the very smallest kind of artistic criticism on some chandeliers in the corridors which seemed to me too big, as hiding some of the architectural features. My remark did not call forth any artistic defence of the chandeliers; but I was much struck at the remark which it did call forth. Some one or other, I was answered, must have had some corrupt object in making them too big. It is

* From an article by Dr. E. A. Freeman in *Longman's Magazine*.

certainly odd that one cannot make the most purely artistic criticism, either for or against anything, without calling up thoughts which have very little to do with artistic matters. Certainly I should be sorry to think that the architectural forms of which I speak carry with them any necessary taint of political corruption. For in these round-arched buildings I see a good hope for a real national American style. The thing seems to have come of itself; and the prospect is all the more hopeful if it has. I should be better pleased to think that the forms which pleased me when my eyes were fresh from Ragusa and Spalato were the work of men who had no thought of Ragusa and Spalato before their eyes.

THE LATE MR. J. S. LEE.

WE regret to have to announce the death of Mr. John Swanwick Lee, of Craven Street, the senior partner in the well-known firm of architectural surveyors. Although Mr. Lee had only reached his fifty-fourth year, a list of the works with which he was entrusted would occupy a great many pages. But it may be stated that his practice extended to all parts of the United Kingdom, and also to France. Mr. Lee was associated with the late Sir Gilbert Scott and other leading architects for upwards of thirty years. The details of the largest and most important public and other works of his generation passed through his hands. It is not too much to say that more than 500 estimates of important works bear his well-known signature, which was not only an acceptance of responsibility, but a test of the utmost accuracy.

Mr. Lee's practice combined land and estate works as well as building. The engineering works at Seaforth Bay, Sussex, which he designed, may be considered to be a model of an efficacious system of protecting at a moderate cost lands which are endangered by the sea. Mr. Lee was a scientific surveyor. He took a great interest in mathematics, and a paper on the Great Pyramid triangle by him may lead to important scientific results.

Mr. Lee's death will be mourned by a large circle of friends and acquaintances, and his loss to the immediate neighbourhood of his residence in Southgate will be greatly felt. He co-operated heartily in every philanthropic or other movement for the benefit of the locality, and his death has thrown a deep gloom over the neighbourhood. Mr. Lee was a native of Macclesfield, and was a pupil of the late Mr. Charles Balam, surveyor. He leaves three sons, two of whom are partners in his firm; his second son is Mr. Thomas Stirling Lee, the sculptor, who was successful in the late competition for the sculpture of St. George's Hall, Liverpool. In all relations of life Mr. Lee was just and upright, and gained the respect of those with whom he came in contact.

THE CALCUTTA EXHIBITION.

THE following regulations have been prepared for the guidance of exhibitors at the great Exhibition which will be opened in Calcutta on December 4, 1883:—

1. The introduction of any dangerous substance is strictly prohibited.
2. All packages intended for the Exhibition must bear the printed official labels, which will be furnished to the exhibitors, and must be consigned as directed in order to be admitted free.
3. No sketch, copy, or reproduction of any object exhibited will be allowed to be taken without the special permission of the exhibitor and the approval of the Committee; the right of permitting general views is, however, reserved by the Committee.
4. An official general catalogue will be published by the executive of the Exhibition.
5. Every facility will be afforded to exhibitors desirous of being relieved of personal supervision in connection with the transport, display, and care of their exhibits, for entering into arrangements with regard thereto, and also for conducting sales and dealing with consignments.
6. The usual precautions to preserve objects exhibited from injury will be taken and the buildings will be watched by active officials; no responsibility, however, will be undertaken for any damage or loss, however caused. Exhibitors can effect insurances on their own account.
7. The arrangements with reference to machinery in motion will form the subject of special regulations.
8. Subject to official confirmation, agents can be appointed by exhibitors.
9. Exhibitors or their agents must defray all charges in connection with space, packing, forwarding, receiving, unpacking, and repacking of goods, as well as such other incidental expenses as may arise.
10. All arrangements for the display of articles to be exhibited, including special constructions, stands, cases, tables, shelves, and the mounting of machinery and apparatus, will be at the charge of the exhibitors, and must be carried out in accordance with plans officially approved.
11. Whatever remains unsold at the close of the Exhibition must be removed within thirty days. Articles unclaimed after that time will be removed and stored at the risk and expense of the owner. Exhibitors must conform in every way to the present and such other rules and regulations as may from time to time be issued. Applications for space, with full particulars of the intended exhibit, must be made at the office of the Secretary or official agent, and will be received up till August 1, 1883. The

ordinary charge for space will be 2s. for each of the first twenty square feet, and 1s. for every additional square foot; but exhibitors desiring a frontage to the main avenue for the cases can obtain it on payment of an additional 5s. per foot of such frontage, irrespective of depth. A passage of from two to three feet will be left round each case where desired, and exhibitors desirous of having spaces against the wall should mention the fact at the time of application. N.B.—All applications must be accompanied by payment of the full amount for the space. The general reception of articles in the Exhibition buildings will commence on or before October 1, and cease one week before the opening, after which date no exhibits can be received, and all vacant spaces become forfeited. Certificates and gold, silver, and bronze medals will be awarded to exhibitors. A special jury will be appointed for this purpose.

It is intended to keep the Exhibition open daily from 7 A.M. to 6 P.M., and from 8 P.M. to 11 P.M. on or about December 4, 1883, until it is closed on or about March 1 following. Applications for space must be made before August 1, 1883. All goods addressed to the Secretary will be admitted to Calcutta duty free.

THE GREAT BUILDINGS OF THE WORLD.

AN inaugural lecture, the first of the eighteenth course of the Liverpool Corporation Free Lectures was delivered on Wednesday evening in the Rotunda Hall, by Sir James Picton, F.S.A., to a crowded audience.

Sir James Picton said it was the eighteenth time he had had the honour of opening the winter course of lectures, and after eighteen years spent—so far as it was in his power to do—in catering for the entertainment and instruction of his fellow townsmen, it might not be wondered at if he felt pumped out. After stating that his services were now, as much as they had ever been, at the command of his native city, and that they would so remain so long as he lived, Sir James pointed out that there had occurred to him the avoidance of two extremes in getting up his lecture. He did not wish to give them a lecture purely architectural, nor did he desire to present to them a mere series of pictures without comment for instruction. Passing to the subject of his lecture, Sir James remarked that architecture was, perhaps, the very earliest of the fine arts. It did not appear that human wants gave the first direction to architecture. Worship and commemoration of the dead gave it its first impulse. To show its earliest outcome, the remains of Stonehenge were projected on the canvas, with an effect which elicited for Mr. Knott applause, which was frequently repeated during the evening. From the plains of Wiltshire, the lecturer passed on to the plains around Cairo, Mr. Knott aiding him by presenting the most bulky marvel of the world—the most famous of pyramids—with the almost buried Sphinx in proximity. The Temple of Luxor, dating back at least 3,000 years before the Christian era, presenting marvellous evidences of existing civilisation, was presented and pointed out; and then Sir James transported his audience to India, and to scenes of Buddhist worship. The Cave Temple of Elephanta was presented in all the marvellousness of its modern decay, and, following it, there was portrayed the marvellous structure which Shah Jehan erected to the memory of his wife. The classic shores of Greece were next visited, Sir James taking his audience at once to the Parthenon crowned Acropolis. The pictures presented of the scenes there by Mr. Knott were very fine, and quite worthy of the lecturer's word-painting. Rome—mistress of the world for nearly five hundred years—was next brought into requisition for specimens of architectural splendour, Sir James taking occasion to point out how Roman architecture was differentiated from that of Greece.

Foremost he put the aqueducts, pointing out especially the magnificent remains near Nismes, in France—remains so perfect that they might at once be put into use for their original purpose. At this point Sir James made a reference to the Roman method of conveying water as contrasted with the Liverpool system. The Vyrnwy works may be carried out, and, great as they are, nothing might be left of them for the future; but the work of the Romans—perhaps because they knew less of hydraulics, remained and were likely to remain. After reference to the Coliseum, the mighty work of Vespasian and Titus, the greatest theatre of all the ages, Sir James passed on to those great features of the architecture of the conquerors of the world, their triumphal arches. Those of Titus and Constantine—first of the Christian emperors—were splendidly delineated on the canvas, and the lecturer pointed out how the latter showed evidences of the decadence of Roman art. The Pantheon, and next St. Peter's—"the centre of Christendom, and the noblest Christian Church in the world"—were submitted to view with rare effect, and then came that marvel in marble, Milan's unique cathedral, said to be the most perfect of churches. Leaving Rome, Sir James passed to Venice, and famous legendary St. Mark's was shown and described. Pisa, with its famous tower and other unique buildings came next; Spain followed,

those "poems in stone," the Alhambra of the Moors and the famed mediæval Cathedral of Burgos being selected as the representatives of Spanish architecture. Rushing across the Continent, Sir James took his audience with him to Russia, and first to the marvellous church built by Ivan the Cruel. After describing this church, he remarked that the effect was such as might be produced by a New Zealander or a South Sea Islander who had devoted himself to art. That centre and glory of the Russian empire—the Kremlin—was next shown, and away from there a return journey was made. What France has to boast of in the way of architecture was shown by Notre Dame, by the Church of St. Genevieve, and by the Louvre; whilst that which has passed away was indicated by a reference to the Tuilleries. Sir James did not touch upon English architecture, and only made a brief remark as to that of America.

TRURO CATHEDRAL.

DURING the past twelve months the building of Truro Cathedral has made a striking advance. Last Christmas the structure had reached to about the nave floor; now the exterior work in hand has arrived at half its ultimate height, and presents a very imposing appearance. The portion of the building at present in hand is the chancel, as, in the meantime, funds will not permit of more of the edifice being proceeded with. The choir walls of the chancel are all up level with the triforium; but in some places the triforium piers are rising, in one or two instances, as high as the caps. The walls of the north chancel aisle are up to their level and the parapet is nearly fixed. All the south aisle arcade is finished, the circular windows on the south side of the narrow aisle are fixed, and the walls are levelled up nearly ready for the parapet. In St. Mary's aisle the eastern window is finished, and four of the windows on the south side are finished, and one more nearly so. On August 1, the excavation of the great north transept was begun, but the walling was not fairly started until the end of October. The walls are now up to within six inches of the nave floor, which is the height at which they will remain for the present. Mr. Pearson, the architect, however, considers it would be best to carry the walls up to the triforium and thus obtain additional congregational accommodation, as so much of the chancel will be occupied by the choir and church dignitaries. But, to do this, more funds must be forthcoming, and a special appeal will be issued. The concrete foundations are in for the two great western tower piers, and all the concrete foundations are laid for the south porch, but these foundations will not be built upon at present. Under the management of Mr. R. Swain, the clerk of the works, the building is progressing satisfactorily, and it is probable that next Christmas, if not before, the chancel will be so far completed as to admit of service being held in the choir. The edifice presents an imposing appearance from the High-cross, the two eastern piers of the great tower and the grand Gothic western arches of the north and south chancel aisles making a fine effect. There are between 160 and 170 workmen employed at present, and it is satisfactory to state that no accident in connection with the erection of the building of any serious importance has yet occurred.

The Dublin Museum Competition.

SIR,—The correspondence which has taken place lately between the Education Department and the Treasury on the one side and a committee of the inhabitants of Dublin on the other, indicates the persistence of those who are endeavouring to upset the results of the competition for the Museum. The latest dodge is the revival of a scheme for the formation of a special Science and Art Department for Ireland. If the Corporation or the citizens of Dublin had ever shown any enthusiasm in the promotion of education in science or art, there might be some grounds for soliciting the creation of a new Department. But when it is known that they have never taken the least interest in the subject, the coolness of the proposal is, to my mind at least, somewhat remarkable. In almost every town in England and Scotland the Corporations do something to encourage students, but the Dublin authorities have hitherto ignored schools of all kinds. A body that is so largely made up of publicans can hardly be supposed to be so self-sacrificing as to help in creating schools and museums, which would be rivals to their own attractive establishments. But the Councillors now profess to be inflamed with a desire to become the patrons of art and science. They are pained when they find the Government will not consult them about the style and arrangements of the new Museum. What is more extraordinary, the Dublin architects, who ought to be sensible men, are sympathising with the Corporation. But it would not be more absurd on the part of the Government to

consult with the Corporation on the means to be adopted for the suppression of treasonable practices in Dublin.

In 1868 a Commission, composed mainly of Irishmen, reported that it would be detrimental to the interests of science and art in Ireland if a separate Department were formed for Ireland. Every one who tries to look at the question impartially will agree with the Commissioners. If the Irish Department consisted only of paid officials appointed by the Government the advantage would only be in a name. But if the Irish Department consisted of honorary officials the students and the public would suffer, unless some new mode of electing the members was invented. How many members of the Corporation would be fit to direct the Department? It would also be difficult to discover eligible members in the learned societies of Dublin. The Royal Irish Academy, for example, has for many years kept its collection of antiquities from the view of the public. The Dublin Society has become absorbed mainly in agriculture, and in the promotion of exhibitions which are not gratuitous. A glance over the correspondence which has been published in the late reports of the Science and Art Department will also suggest that the old spirit of the Society no longer survives, and that the members think more of their own interests than of the public good. If one may judge from the petty attempts of the Society to withhold certain property from the Government, it is not unlikely that the members who might be elected to the proposed Department would after a time lay claim to the chairs and tables of the council room.

In the present state of Ireland, it is ridiculous to talk of an Irish Department of Science and Art. If it were formed, it would soon share the fate of the Art Union and Archæological Societies of Dublin. The Dublin Committee must be aware of this, and the only explanation of their action is that it is not a new Department, but a new competition which is sought for now. It is to be hoped that they are not afraid of the students competing with English and Scottish youths. At present the prizes in the Dublin Science School are carried off by an inferior class of English students. Fortunately the Government are able to estimate the worth of what is called Irish public opinion. Mr. Mundella has simply stated facts when he tells the Town Clerk of Dublin that the site for the new Museum was not chosen by the Government, and that the plans were selected by a committee of Irish gentlemen. But when he suggests that the Dublin Committee should represent their views to the Lord-Lieutenant, Mr. Mundella is (I say it with all respect) giving encouragement to agitation. The committee have been giving representations for months, they have demonstrated that they have strong lungs and perseverance, but they have not given any indication of skill in designing museums. Irishmen have a natural aptitude for making mountains out of molehills, and any shortcomings there may be in the site and in the designs for the building to be erected upon it are magnified into national calamities. The honest architect (he is, I believe, a member of the Dublin Committee) who startled nervous travellers some years ago by declaring that he saw tons upon tons of rust removed from the plates of the Britannia Bridge, is a type of his countrymen when their imagination controls their reason. The future of Ireland is supposed to be in peril because an English architect is likely to be selected to erect a simple museum. Let the building be erected, there will be the usual reaction, and the citizens will be as proud of it as they are of the Custom House, the Four Courts, the Bank, and other works of English architects which give character to Dublin streets. Meanwhile, it is hard for the competitors to endure the delay in selecting one of the designs. The Dublin Committee may talk of compensation to them—for it is easy to be liberal with other people's money—but what is wanted is justice, or, in other words, the realisation of the promise made by the Government that one of the five competitors who were successful in the first competition should be entrusted with the erection of the building. This is a matter no less important than the gratifying of a few people in Dublin, who have made themselves the exponents of what is called "Irish Public Opinion."

I am, yours truly,

AN ARCHITECT.

Construction in America.

SIR,—I shall be obliged if you will kindly allow me to refer to one or two inaccuracies in your very full report of my paper recently read before the Royal Institute of British Architects. These, if unnoticed, would imply a somewhat limited use of the ample facilities afforded me when in America.

The Philadelphia bricks referred to are very true in shape and exceedingly hard, the crushing weight sustained by one of the usual size (8 inches by 4 inches by 2½ inches) was 500,000 lbs. for a space of 5 minutes.

The roof of the Mills Building in New York was described as composed of several layers of asphalted felt laid upon the hollow brick arching, and covered with ordinary hard brick laid in asphalt and grouted in cement.

The public buildings in Philadelphia are in one continuous range surrounding a central courtyard, open and free from

obstruction, the latter being one of the finest features of the structure.

I am, Sir,
22 Surrey Street, Strand, W.C. Yours faithfully,
January 3, 1883. ARTHUR J. GALE.

REVIEWS.

ART AND THE FORMATION OF TASTE. Six Lectures. By LUCY CRANE. With Illustrations drawn by Thomas and Walter Crane. Published by Macmillan & Co.

The late Miss Crane belonged to a family of artists, and it was almost inevitable that she should possess not only a love of art but "considerable taste and skill in drawing and colouring." General educational work, instead of painting or designing, was, however, destined to employ her abilities. Miss Crane's knowledge of art was utilised for lectures in classrooms. After some elaboration the lectures were delivered before friends, and subsequently in public, with so much success as to promise a brilliant career. She was anticipating the pleasure of a tour in Italy, when she died suddenly in Bolton in March last. The lectures have been published in the hope that they "may serve as a memorial of her to her personal friends, and to those who heard the lectures, independently of the value and service the book may bear for that now large public interested in its special subject." The value and service which the little book is capable of rendering are undoubted. It is full of good sense as well as knowledge, and all is given with that lightness of touch which should be a characteristic of the writing of an English lady. Miss Crane believed in the teaching of Mr. Ruskin and Mr. Morris, but she was able to observe and reason for herself. The definition of art which was adopted for the lectures is "Human labour regulated by human design." It follows that Miss Crane was opposed to machine-work and to that division of labour which is the guiding principle of so many modern manufactures. In giving suggestions for the furniture and decoration of houses and for the costumes of her friends, she speaks as an artist. "Those of us," says Miss Crane, "who have learned in house decoration and dress to find how much more becoming and agreeable delicate and soft colouring is than glaring metallic dyes; how much more delightful and serviceable are softly-falling and clinging stuffs than stiff and rustling ones; and how much better and more elegant are simplicity and delicacy in form than massiveness and cumbrousness—those I say who have learned all this, are never likely to return to mauve and magenta, to crinolines, to yards of gilt cornices and acres of costly looking-glass." People who prefer handwork to the products of machinery must endeavour to meet the workman himself, but the difficulty often is how to discover him. At a time when there is a suspicion that even works of so-called high art can be produced on what are called "commercial principles," like so many pins and needles, the following observations on the manufacture of jewellery may have use:—

"According to the modern system of producing jewellery, the design has been made by one man, the dies sunk by another, the striking up by a third, some foliage and filigree work added by a fourth, and some shallow, scratchy engraving to complete the pattern by a fifth, and it becomes what the accomplished shopman who sells it calls 'a truly sweet thing in bracelets of the newest and most original design.' In days when goldsmithery was an art, the artist sat in his stall and took his orders himself. And in these days, if those who *use* would take the trouble to find out those who *make* and deal at first hand with them, not only would they get much better and cheaper articles than through the medium of the shopman, but they would get much more pleasure out of the things they buy, as the workman would get more pleasure out of the things he makes. It is often possible to deal directly with the workman, particularly about country neighbourhoods, in such things as carpenter's work, for instance. In London, indeed, it is hardly ever possible to get at the working carpenter, the working jeweller, the working dressmaker; there is always some very smiling and obliging shopman or woman between us and the worker, the person whom I, for one, the most want to see."

The experience of most people would not be the same as Miss Crane's in finding it to be cheaper to deal directly with the workman. Materials count for much, and the workman cannot secure them on the same terms as the ordinary shopkeeper, who is able to purchase a larger quantity. Workmen have generally no fixed price, and they are rather lax in executing orders when there is no overseer. In a word it is more convenient on many accounts to deal with large establishments. It must also be admitted that there are few trades in which the "worker" nowadays dispenses with division of labour; however limited may be his operations, he has help of some kind, and more than he cares to acknowledge. The difference between large and small establishments is consequently only in degree. But in all cases where the division of labour is adopted, there must be a decrease of interest among the operatives, for no one of them can consider the production as his own. This is the great impediment to the extension of industrial education. The workmen see that economic

laws fix a limit to their participation in what is done, and the advantage of a capability for what is beyond that is not evident.

The object of the lectures is the formation of taste, and Miss Crane is too sincere in her love of art to suggest that it may be formed by a course of six lectures. The majority of people in this country do not of course consider that even one lecture is necessary. Opinions can be so readily expressed on works of art without the need of study it seems to be "a wasteful and ridiculous excess" to seek out principles. Miss Crane would, however, prefer the student to be silent until some knowledge is acquired. In the first lecture she said:—

"Every person, whether arrived at years of discretion or not, thinks himself qualified to judge of a painting or a statue. The most modest say, 'I know nothing about it,' and then proceed to admire all sorts of incompatible and incongruous things. In all other human productions, an enlightened and reasonable person sees at once that it is not enough to know what he likes, but what *is worth liking*; but respecting questions of taste in Art, he thinks himself *born* competent to judge—no matter though he has never given an hour's patient consideration to the subject, or looked carefully at a good statue or picture, or taken a modelling-tool or a drawing-pencil into his hand, so as to form an experimental notion of what it really means, to translate natural forms into pictured or sculptured ones; with all this he is quite ready to pronounce criticisms and opinions on any work of art that comes within his reach. The only way to form a just judgment about these things is to learn, by the study of the masterpieces of art that have come down to us from former times, what constitutes the greatest and best."

The extracts will give a notion of the spirit which inspires Miss Crane's lectures. The book is not only instructive, but may be read through with pleasure.

RIVETTED GIRDERS AND CURVED ROOFS. By THOMAS TIMMINS, C.E. Published by the Author.

So many girders have been built in England during the last forty years, there ought to be little difficulty in preparing designs or in manufacturing girders. But it so happens that, simple as may be the principles of both kinds of work, it is common to find designs that are not practicable and girders which are defective. What can be easier than rivetting a number of plates and angle irons, in which consists the whole art of making ordinary girders? But every year there are thousands of girders turned out of yards in which the rivetting is defective, and the plates are put together with little regard for the positions of the joints. We have known of a case where a large number of girders were delivered, and every cover of the angle irons shown on the drawings was omitted. The contracts had been again and again sublet, there was no examination in the yard, and the makers calculated on the fact that the majority of clerks of works believe that they are not to be held responsible for ironwork. It is a mystery that there are not more accidents from defective girders. "Many thousands of tons of iron are," says Mr. Timmins, "annually used in the construction of builders' girders which would never pass the inspection of any engineer. It is in this particular class of work that the greatest possible laxity exists. As a rule the girders are bought in the cheapest market, and subjected to severe competition."

What Mr. Timmins says is unfortunately too true, and architects should bear in mind the risks that are possible in girder-making. It is only when the work is entrusted to firms who have gained reputé by their work that there is a certainty of ensuring good iron and good rivetting. The operations involved in the production are simple enough, but if a workman is compelled to fill an enormous quantity of holes with rivets in a day, in order to earn average wages, there is a temptation to scamp his work. What with home and foreign competition ironwork has become too cheap. Mr. Timmins suggests the necessity of "special precautions to see that something approaching the quality specified is used in the work." But should there be any misgiving about the iron it is better to have pieces tested at Kirkaldy's. His is the only machine in this country that can be considered a standard—it is always in working order, and of the impartiality of its results there is no doubt.

It is, however, with the designing of girders that Mr. Timmins' book is mainly concerned. After some general directions about iron, rivetting, drilling, painting, &c., several tables of the weights of plates and angles are supplied. There is also a most useful table which, by simple multiplication, supplies the technical areas required for girders up to 7 feet deep and 80 feet span. Then follow several sections of single webbed and box-girders, corresponding with the areas in the preceding table. There are several drawings of Warren and plate girders, showing also diagrams of strains. As in Mr. Timmins' volume on roofs there are no "fads" in the designs; they are all of the kind which is most desired by makers, practical considerations having been observed throughout. We think it would have been better in most of the cases to have had larger bearings on the abutments, and the depths of the girders are sometimes less than is desirable, unless the conditions were imperative. But in regard to these things architects can judge for themselves. In Mr.

Timmin's book they have a collection of most useful examples presented in the form that is best adapted for office use.

SKETCHES OF THE OLD DOMESTIC ARCHITECTURE OF OXFORD. By R. W. MOORE, A.R.I.B.A. Oxford: Published by the Author.

Mr. Moore has prepared twelve folio sketches of some interesting buildings in Oxford, but which are not as well known to visitors as they deserve. The subjects are Bishop King's Palace, the "Old Crown" Inn, an old timber building at Balliol, Prideaux Buildings, Nixon's School, Kettle Hall, an old house in High Street, Black Hall, St. Giles, the "Plough," the "William IV." in Holywell Street, part of Old Magdalen Hall, and the last plate contains several "odd bits" from various buildings. The windows especially in the buildings selected contain features that are suggestive at the present time. Mr. Moore is an excellent draughtsman, and his sketches express the characteristics of old work in a graphic manner.

THE IMPERIAL DICTIONARY OF THE ENGLISH LANGUAGE. By JOHN OGILVIE, LL.D. New Edition by Charles Annandale, M.A. Published by Blackie & Son.

One of the most important literary events of the season is the completion of the new edition of "The Imperial Dictionary," and it is satisfactory to be able to testify that all the promises in the publishers' prospectus have been faithfully carried out. As it was their resolve to make the work "a complete encyclopedic lexicon, literary, scientific, and technological," they were not satisfied with the most comprehensive collection of words in the language. There must also be a supplement to the fourth volume, containing "additional words and additional meanings and explanations," the majority of them being technical terms and other words that have not been used in the sense given more than once or very rarely. One of those words is "architecture" as a verb, in which sense it was employed by Keats in his lines on Fingal's Cave—"This was *architected* thus by the great Oceanus." Another word preserved in the Appendix is "æsthete," which is said to be "specifically applied in a semi-contemptuous way to one who carries the cultivation of the sense of the beautiful to a ridiculous extent." "Boycotting" is another modern addition to the language. Ensilage was not familiar in England when the second volume appeared—but it is so now to many besides agriculturists. Then there is "folly" in a sense which is not unknown to architects, and which is defined to be "any object planned without its author having the means of bringing it to a successful completion, such as a magnificent mansion which exhausts a person's capital in building, or would ruin him in keeping up in proper style." Other useful additions are the vocabularies of geographical names, the foreign words and phrases, and the extensive collection of abbreviation and contraction. The list of authors who have been quoted fills sixteen closely-printed pages, representing the principal authorities in all departments of English literature, and as living writers are referred to as often as is practicable, the extracts express the sense now given to words, and become tests of the accuracy of the definitions. For the explanations of technicalities it is evident that experts have been consulted, and "The Imperial Dictionary" can consequently be appealed to in those law cases where so much depends upon the meaning that is given to particular words. One of the characteristics of the work is that wherever necessary the definitions are followed by short articles upon the subjects, and it thus becomes an encyclopedia rather than a dictionary. The articles are never unnecessary or pedantic. In arranging the dictionary the editor has observed proportion throughout, for Napoleon's maxim, "Nothing should be done except by calculation, and whatever is not considered in all its details can lead to no useful result," is as applicable in dictionary-making as in war. It has required the labour of more than ten years to prepare this new edition, and the expense attending the production of volumes which are noteworthy for their mechanical execution must have been enormous. We hope that the publishers may secure the reward which is their due. The famous Henry Stephens was compelled to lament that his dictionary, which was a true Thesaurus to scholars, brought loss to himself. We live in better times, but too many people have yet to learn the advantage of possessing a dictionary that worthily represents the English language.

The Royal Commission entrusted with the erection of a colossal statue in Rome to the memory of the late King Victor Emmanuel have issued the conditions on which the sculptors of all nations are invited to compete. It is to be an equestrian statue in bronze erected upon the northern height of the Capitoline Hill in a direct line with the Corso, and will stand upon a platform approached by steps at an elevation of 88½ feet from the ground. It will also be provided with an architectural background, composed of a portico or loggia, upon which, as well as elsewhere, the competitors are to commemorate by statuary or historical, symbolical, or picturesque art, the men and events associated with the name of the king, as having been foremost in promoting the national liberty and independence.

ENGINEERING WORKS.

The Bromley Bridge Accident.—Colonel Yolland has reported to the Board of Trade the result of his inquiry into the circumstances which attended the falling of a portion of a bridge over the London, Chatham, and Dover Railway between Bromley and Bickley stations, on November 23 last, by which seven out of eight persons who had taken shelter in a hut standing under the southernmost arch of a bridge were suddenly killed. The inspector reports:—"The failure of the Ivy Bridge was due to a subsidence of the north pier between the down main line and the gasworks siding. The base of the pier appeared to have passed through the footings on to soft yellow clay, and then commenced to slide northwards on some blue clay, so that the base of this pier had moved laterally to the north about 12 inches, and had sunk vertically about 14 inches. I think it probable that the subsidence of the north pier, after having stood for about twenty-four years without exhibiting any weakness of any kind, may have been facilitated by the removal of the earth under the north arch, and that the water during a somewhat wet season had passed down to the clay under that arch, softened it, and permitted the clay to be pushed upwards, and lifting up the rails of the gasworks siding to the extent of about four inches and allowing the north pier to settle down and then slide towards the north. I attribute the fall of the south pier and south arch to the vibration caused by the running of the traffic on the up line, as it will have been seen that it fell without apparently giving any warning whatever to the parties who remained at the bridge, thirty-two minutes after the running of the traffic had commenced, and within five minutes of the passing of the first down train at 6.47 a.m. It is greatly to be regretted that steps were not taken to enforce the orders of the inspector of permanent way, that no persons should be permitted to go into the hut under the south arch.

TOWNS IMPROVEMENT.

Brighton.—The Brighton Town Council on Wednesday decided to expend a sum of 6,000*l.* on improving the sea-front. A scheme is proposed to form a range of enclosures in front of the sea wall, to be laid down with grass, and planted with shrubs, as shown by the general plan. These enclosures are three in number. The central one is 200 feet in length, and the others are each 300 feet in length. They are 50 feet in width, and a space of 20 feet in width is left between the enclosures and the existing esplanade wall. A space of 50 feet is left between each enclosure and the next one to it for access to and from the beach. The earth within the enclosures is intended to be raised on the south side so as to slope towards the upper esplanade, which will give a better view of the gardens and protect the shrubs and plants from the sea breezes. The southern sides and ends of the enclosures will be protected by a sea wall, which will rise about five feet above the beach at that point, but will be hidden from view from the upper esplanade by the garden, embankment, and shrubs. The north side and ends of the enclosures and cross paths will be protected by light iron fencing. For the whole length of the south side of the sea wall, long ranges of covered seats are provided, and six special semi-circular covered seats are also placed in alcoves or recesses in the wall. The central enclosure has an arrangement for paths within it, with a range of seats at each end, but the other enclosures are not intended to be open for walking upon. In the central enclosure, opposite Bedford Square, it is proposed to erect an ornamental covered platform, with a balcony around it, approached from the existing esplanade by a small bridge, so that it may either be used as a part of the promenade or for a band stand. Beneath this it is proposed to construct lavatories, accessible from the beach through the garden of the central enclosure, and partly screened by it. There are separate entrances approached by two side paths, one on the east side and one on the west side of the building, which is divided into two parts for the separate accommodation of ladies and gentlemen.

ARCHÆOLOGY.

The York Museum.—The collection bequeathed to the museum of the Philosophical Society by the late Mr. G. A. Robinson is of much interest to the archaeologists. Mr. Robinson began by collecting pre-historic antiquities, and laid the foundation of his collection by purchasing an entire collection of Irish antiquities offered for sale at Edinburgh in 1877. That collection contained several specimens of great value and rarity. One was a remarkably fine bronze trumpet of very good workmanship, and measuring between two and three feet long. There were also two ancient cauldrons of fine metal and highly wrought. The stone and flint weapons in the collection were remarkable and numerous. In addition there were about 100 bronze implements of various kinds. Having obtained this Edinburgh collection, Mr. Robinson added to it largely. He purchased an antiquarian collection from Mr. Edward Wood, of Richmond, whose geological treasures had

been presented to the museum some time ago by Mr. W. Reed, of York. The following resolution has been adopted by the members of the Society. "The members of the Yorkshire Philosophical Society greatly acknowledge the gift to the museum of the late Mr. Alderson Robinson, of Reeth, which has been most generously made to them by that gentleman's representatives. It is a pleasure to them to observe the interest which is taken in the welfare and progress of the Society in every part of the county of York, and they desire the secretary to convey to Mr. Robinson's representatives their earnest and hearty thanks."

The Roman Excavations.—A correspondent of the *Times* gives a long report of the state of the excavations which have been undertaken in Rome. The work accomplished so far is a good earnest of what may be looked forward to when the Palatine and the Forum—the area within which the whole history of Rome centred and can be studied—are excavated as completely as the remains of Pompeii, cared for with the same scientific discernment, and placed, as what is left of that ancient city is, open to the easy comprehension of the most simple. What is seen at Pompeii is seen completely, and can be understood. What is visible of the Palace of the Cæsars and other remains on the Palatine, and of the Forum, can only be seen by looking into a number of separate holes, and when seen can only be imperfectly understood after infinite puzzling. The educational value of these excavations will be apparent to all when it is remembered that the locality teems with memories, traditional and historical, vague and precise, from the days when the massive stones of that primitive wall of fortifications—whether built by Romulus, to whom it is attributed, or by some other—of which we have remains on the Palatine, were laid together to those when the colossal palace of the Cæsars, as compared with which the Vatican, with its 11,000 rooms, would afford but scanty accommodation, lay buried under a cabbage garden, and the very name of the Forum, the heart and centre of the great Roman Empire, was comparatively lost in that of "the cowfield." Twelve years ago the question of the very direction of the Forum—did it extend from north to south towards the Arch of Titus, or from east to west toward the Circus Maximus?—was still a matter of controversy. Certainly, they were few who continued to hold to the latter theory, but clear as the case appeared to the majority, there was then no visible evidence they could put forward as decisive. The rest of the world looked upon them as mere archæological controversialists like the minority, and what they taught afforded no solid basis of instruction. Ten months ago no one could prove which of the two streets running along the Forum was the *Sacra Via*, and the theories as to its course were many. The difficulty has not yet been set at rest to the satisfaction of all, but the weight of authority is agreed that the excavations made last spring revealed the exact line of the celebrated street "glorified by a hundred victories," and the removal of comparatively a few more square metres of rubbish will settle the question for ever. There are, with one or two unimportant exceptions only, no longer any doubts as to the names of the temples and other remains standing on the uncovered portion of the Forum. No one disputes the fact that we can point with certainty to the ruins of the Temple of Augustus, built on the spot where the body of "great Julius" was burnt, and to many other historic sites; but all this is still of but limited educational value, for bewildering controversy is rife—and will continue so until the whole area is cleaned—as to where the Comitium, the *Greco-stasis*, the other *Rostra*, and many more important details were situated.

SCHOOL BUILDINGS.

The City of London School.—The site of the new school buildings on the Thames Embankment (which were lately opened) has a frontage of 136 feet and a depth of over 430 feet. It was presented to the school committee by the Corporation, and is valued at 95,000*l.* The building is L-shaped. The shorter arm of the L, facing the Embankment, is three stories high, and contains the great hall on first floor, the administration rooms and library on ground floor, and a covered playground on basement. In the longer arm is the teaching block, containing natural science school and lecture-hall and two class-rooms on second floor, 18 class-rooms on first and ground floors, with hat and cloak room, dining-room, and covered playground on basement. The style is Italian Renaissance, enriched with carving and sculpture. The exterior of the hall block facing the Embankment is constructed of Portland stone, with red granite shafts for the columns of the windows. The cost of the building will be about 100,000*l.* The architects are Messrs. Davis and Emanuel. The preliminary contract for the foundations was carried out by Messrs. Higgs & Hill. The main contract for the building was carried out by Messrs. John Mowlem & Co. Among the sub-contractors employed by them may be mentioned Messrs. Measures, for the constructional ironwork; Mr. Mitchell, for the marble-work to the principal staircase; Mr. Ebner, for the marble mosaic floor of hall; Messrs. Jones & Willis, for the ornamental iron grilles at the front entrance doorway; Mr. Boekbinder, for the carton-pierre work in the cove of great hall; Messrs. Holden, for the copper-work to the central flèche, with its

wrought-iron skeleton and dormers of hall roof; Mr. Boyd, for the class-room grates, and Messrs. Steel & Garland those for library and committee-room; the Coalbrookdale Company, for the pillar lamps on balustrade; Mr. Anderson, for the lightning-conductors. Milner's Lock and Safe Company have supplied most of the locks and lock-furniture, and Mr. Odell the stained glass. Separate contracts were let to Messrs. Herring & Son, of Chertsey, for the hot-water apparatus; Mr. J. F. Clarke, for the gas-pipe work and sunlights, cooking apparatus and fittings, and sundry gas-fittings; Messrs. Strode and Mr. R. H. Hughes, for the more important gas-fittings; Messrs. Daymond & Son, for the sculpture; the North of England School Furnishing Company, for the great hall and school seats and desks; Messrs. Story, for the general furniture; Mr. Laurie, for masters' tables, blackboards, &c.; Messrs. Willis, for organ; and Mr. Spencer, for the fitting-up of gymnasium.

NEW BUILDINGS.

Manchester.—A Nurses' Home has lately been erected at the Royal Infirmary, Manchester, the new building being at the rear of the Portland Street wing of the Infirmary. Accommodation has been provided for seventy-seven nurses, each having a separate bedroom. There are apartments for the lady superintendent; the home sister, who has charge of the establishment; eight head nurses, or sisters; twelve staff nurses; twenty-seven probationary nurses; seventeen night nurses; eight private nurses, who may be waiting to receive engagements in private families; and three nurses who may have the misfortune to be disabled from the performance of their duties by sickness. The cost of the building, including furniture and fittings throughout, has been 5,780*l.* The building consists of three floors, and is connected with the Infirmary by a covered way communicating with the first floor. The contractors are Messrs. W. Southern and Sons, Salford; and the architects Messrs. Pennington and Bridgen, of Manchester.

Rochester.—New offices for the Brompton, Chatham, Rochester, and Gillingham Water Company have been recently erected in Railway Street. The building is designed in French Italian style, and contains clerks' office, private office, a board and shareholders' meeting room 48 feet long and 20 feet wide, workshops, store room, lavatories, and a commodious residence for the secretary. The interior is fitted up with handsome moulded doors, brass gas fittings, pneumatic bells, and Belgian marble chimney pieces. The exterior is faced with Aylesford Pottery bricks, and the stone dressings are of Portland and Box stone. Mr. E. W. Stephens, F.R.I.B.A., of Maidstone, is the architect, and Messrs. Naylar and Son, of Rochester, are the builders.

CHURCH BUILDING AND RESTORATION.

Gilmerton, N.B.—Gilmerton Church has just been entirely remodelled, a transept being thrown out on each side, a porch in front, and a vestry, with lavatory in connection, and a heating chamber underneath at the back. By the alterations a total extra accommodation of 172 sittings has been provided. The work has been executed from the plans of Mr. John Gershom Adams, architect, Edinburgh.

Brigg.—The parish church was lately re-opened after alterations which have been carried out under the direction of Mr. W. White, of London, and Mr. J. Parker, of Brigg.

Hereford.—The ancient parish church of St. Devereux has been re-opened after restoration. In course of the work the south wall and buttresses of nave had to be taken down and rebuilt. Mr. Cheiake, of Hereford, was the architect, and Messrs. Hucksion & Warwick, of Hereford, were the builders.

Quenington.—The church of St. Swithin, Quenington, has been re-opened after works of reparation. These works have been carried out under the supervision of the diocesan architect, Mr. F. Waller, of Gloucester. In the tympanum of the north door is an ancient sculptured representation of good overcoming evil—an angel with cross and staff destroying a dragon, and rescuing three souls from perdition. In the tympanum of the south door also is a carving, and though it is much decayed, the representation of a church with human figures suggests that the design has reference to Swithin, the patron saint, who founded several churches at Winchester, of which he was bishop, and the sculpture is probably intended to represent his first interment.

Kenn.—The western tower of the parish church, St. Andrew's, Kenn, and belfry has been restored and the bells rehung. The works have been carried out under the direction of Mr. R. Medley Fulford, F.R.I.B.A., of Exeter, by Mr. H. Stokes, of Woodbury.

Penzance.—The contract for building a new Post-office at Penzance has been let to Mr. J. P. Berry, of Plymouth, and the work is to be commenced. The building is designed by Mr. Hicks, architect, Redruth. It will have an imposing elevation towards Market Jew Street, two storeys in height, composed almost entirely of cut granite. The main room on the ground floor will cover an area of about 50 feet by 40 feet.

Rochester.—The church of St. Mary, Hoo, has been restored. Among the works carried out the roof has been repaired and strengthened, a new vestry and porch built, and also a new chancel arch. The interior has been reseated. The works have been carried out by Messrs. Naylor and Son, of Rochester, under the direction of Mr. E. W. Stephens, F.R.I.B.A., of Maidstone.

Nettleham.—All Saints' Church, Nettleham, has been reopened after restoration. Among other works effected the roofs of chancel and nave have been coloured in the subdued and rich tints, the end of the north aisle thrown open into the tower, a new organ-chamber and vestry added, and the whole fabric solidly repaired. Messrs. Bodley and Garner were the architects.

Devonport.—The foundation and memorial stones of a chapel in Dockwell Street, Devonport, have lately been laid. The building is being erected from the designs of Mr. J. Piers St. Aubyn, by Mr. E. Thacker, builder. The walls will be of limestone with red brick dressings.

Queenstown, Cape Town.—The foundation-stone of St. Michael's Church was laid lately by the Premier, the Hon. T. C. Scanlan. A sum of 225*l.*, including a donation of 15*l.* from the Freemasons, was subscribed towards the completion of the building. The style is Early English, and the designs were prepared by Mr. W. H. Reid, architect, 8 Crewes Buildings, Cape Town.

GENERAL.

The Royal Society of Artists have presented Mr. J. Aumonier's painting, *A Nook in Nature's Garden*, to the Birmingham Art Gallery. Mr. J. Jaffray has also presented Mr. Feeney's *Llyn Idwal*; the *Cradle of the Mist*, to the gallery.

The Plans of Messrs. Maxwell & Tuke, 29 Princess Street, Manchester, and Bury, have been accepted in the competition for the Ulster Reform Club, Belfast. They are instructed to immediately proceed with the building.

The Government, it is understood, propose an expenditure of 56,000*l.* at Dover for the erection of barracks for convicts to be employed on the proposed harbour works.

A Portrait of the late Lord Beaconsfield was presented on Monday to the Mayor and Corporation of Maidstone by Sir John Monckton, Town Clerk of London, on behalf of present and former residents. Mr. Disraeli was first sent to the House of Commons from Maidstone. The portrait has been executed by Mr. Sydney Hodges.

A Bill has been lodged in which authority is sought to sell the church of St. Peter, Clifton. A new church has been erected adjoining the old church, but as it is encumbered by a debt of 1,000*l.*, it is thought advisable to sell the old church in order to reduce the debt.

An ancient Aqueduct has been discovered at Posilippo, during the excavation of a tramway tunnel. It is sufficiently lofty for persons to stand upright and walk along it. The walls are lined with thick cement, and they contain inscriptions concerning the villas supplied with water. One of the inscriptions records a partial restoration of the aqueduct.

The new Railways which have been constructed in the United States during 1882 are 11,000 miles in length, and \$270,000,000 capital have been invested.

The new Works proposed for the improvement of the Danube will entail a cost of 16,000,000*fl.* The redeemed land will, it is expected, produce the sum of 14,000,000*fl.*

The Tower of Freckenham Church, near Mildenhall, has fallen. The tower was a square one and contained five bells, which were rung as usual at Christmas time. It had been for some time past in a dilapidated state and was patched up occasionally. The rector has for some time past been endeavouring to collect funds for the restoration of the tower, but without success. Fortunately the tower fell away from the church, or its fabric must have been considerably damaged.

A Bridge is proposed to be constructed over the Humber with a span of 600 feet.

A new Theatre is, it is stated, to be erected in Edinburgh. A site has been procured in Grindlay Street, and plans are being prepared by Messrs. Anderson and Brown, architects. The capital is to be 25,000*l.*, and the theatre is intended to accommodate 2,000 persons.

A Novel Staircase.—Architects who visit the metropolis should see the ingenious staircase in No. 8 New Court Chambers, Lincoln's Inn, which was designed by Mr. Waterhouse, A.R.A., and constructed by Messrs. W. H. Lindsay & Co., of the Paddington Iron Works. The framing is of iron, forming a spiral, but the curves are elliptic instead of circular. This has an excellent appearance, but it must have been difficult to construct such bold sweeps, and the slightest irregularity in the contours would mar the general effect. The treads are formed of Lindsay's Patent Blocks, which have many advantages for stairs leading to chambers and offices.

The County Magistrates, at the assizes of the West Riding of Yorkshire, assented to the publication of Mr. Jeaffreson's report on the Public Records of the Riding, with the report of the Historical Manuscript Commission to Parliament.

The Calne Town Hall is to be rebuilt at an estimated cost of 3,500*l.*

The Alhambra Theatre, the ruins of which are being rapidly demolished and removed, is to be reconstructed as soon as the site is cleared, from the designs of Messrs. Perry and Reed.

Messrs. Hayward Brothers & Eckstein have supplied all the Boyle's patent mica valve ventilators in the class-rooms, dining-hall, lecture-hall, and library of the City of London Schools. Some of them are of exceptional size and of special construction.

Messrs. Larmuth & Sidebotham, of Salford, have arranged with Mr. Lewis F. Day and other artists to prepare special designs for tiles, furniture, &c. Messrs. Moore & Westwood have appointed Messrs. Larmuth & Sidebotham to be their agents for the sale of encaustic tiles.

The Building Exhibition.—We are informed that nearly the whole of the ground space of the Agricultural Hall has now been taken for the Building Exhibition in April next. It is the intention of the secretary, Mr. Phillip Shrapnel, to divide the gallery into enclosed bays, and by this means provide accommodation for the exhibition of art furniture and decorative materials, which will make the gallery a very interesting part of the exhibition.

Messrs. Cartland & Son have introduced a new sash-opener and self-locking fastener, which is likely to be generally adopted. It may be seen at their showrooms, Holborn Viaduct, on application to Mr. Hardy, their representative.

Mr. A. D. Dawnay has been entrusted with the execution of the constructional ironwork, together with the iron transept roofs and dome, of the additions to the Stock Exchange. Mr. J. J. Cole is the architect, and Mr. George Shaw, of Westminster, is the contractor.

A Fine Art and Industrial Exhibition is to be held in Oldham during the summer. The Town Clerk has been instructed to apply to the South Kensington authorities for loans of works of art for decorative and exhibition purposes. The fine arts will be exhibited in the new museum building now being erected at a cost of 10,000*l.*, and the mechanical appliances will be shown in a wooden structure to be raised on the land adjoining.

Woodbastwick Hall, the seat of Mr. Albemarle Cator, Norfolk, has been destroyed by fire. It was a fine Elizabethan mansion, situated in pleasant grounds. The damage must amount to 25,000*l.* or 30,000*l.* Woodbastwick Hall has on two previous occasions—both many years ago—suffered from disastrous fires. It is supposed that the fire originated in or near the chimney of the small laundry.

Mr. J. T. Hutchison, R.S.A., has obtained a commission to execute a bust of the late Professor Sir Wyville Thomson, which is to be placed in the University Hall, Edinburgh. The cost will be 100 guineas.

Mr. F. Johnson, of St. Leonard's-on-Sea, has offered to construct a large concrete breakwater for the protection of the Hastings fishermen, and present it to the town. The cost of such a breakwater would probably exceed 20,000*l.*

M. Bonnat, the French painter, made a sketch of the head of the late M. Gambetta at the Ville d'Avray.

The partnership between Mr. J. J. Bateman and Mr. B. Corser, architects, of Birmingham, has been dissolved. Both gentlemen will continue the practice of their profession, Mr. Bateman with his son under the title of Bateman & Bateman.

Papier-Mâché Finger-Plates.—We have received four examples of the new finger-plates introduced by the Papier-Mâché Company, embodying two designs. One may be described as geometrical, with much open work, which is a test of the hardness of the material. It is finished in two shades of bronze. The other design is more elaborate, having a head in relief central panel, with a raised moulding around, and an anthemion above and below. One of these panels has a coating of bronze; the other is light blue in colour, with a faience glaze, and both are so well completed as to be deceptive. The material has the advantage of being tough, and is broken with difficulty. Patterns are produced with sharpness, and the price is less than is possible with other materials. It is therefore plain that the new door-plates have much to recommend them for use.

Improvement in Trade.—We are pleased to learn that the business of Messrs. Griffiths, Berdoe & Co., paint and varnish manufacturers, of Liverpool and London, whose goods we have frequently called attention to in these columns in eulogistic terms, is developing so rapidly that a considerably increased capital has become necessary to work it properly. The proprietors have therefore invited the co-operation of a few friends, and turned their business into a limited liability company with a capital of 100,000*l.* The present issue is all taken up *privately*, so there are no shares for public subscription.

ELSLEY'S PATENT * BALANCE SASH LEVER.

**ELSLEY'S PATENT BALANCE SASH LEVER
AND WEATHER PROOF METAL SASHES**

Are made in various qualities and are suitable for Public or Private buildings.
The Sash Lever can be arranged to open long ranges of lights with an easy action not to be obtained by any other means.

Sections of Sashes & Casements $\frac{1}{4}$ Full Size.

The following particulars should be sent with all Specifications for Estimates

- 1st Details of Mullions, Frames and Cills;
- 2nd Sizes of Sashes;
- 3rd Height of Sashes from Ground;
- 4th Description and Situation of building for which the work is to be used.

Thomas Elsley sole manufacturer of the Patent
Balance Sash Lever
Portland Metal Works
32 Great Portland Street
LONDON. W.

ELSLEY'S PATENT BALANCE SASH LEVER

Is an apparatus by means of which Top Lights of Windows, Skylights, Lantern Lights &c. can be easily opened or closed and securely fastened. The Lever or Handle and a small iron rod being adjusted in such a manner as to form a counter balance to the rising or falling sash gives an easy action unobtainable by any other means.

May be applied to Wood or Metal Sashes.

Weather proof Metal Sashes may be had in connection with the Sash Lever or otherwise.

Thomas Elsley sole manufacturer:
Portland Metal Works
32 Great Portland St
LONDON. W.

MAY BE APPLIED WITH ADVANTAGE IN SCHOOLS, HOSPITALS, PUBLIC OFFICES, ASYLUMS, FACTORIES
AND OTHER BUILDINGS WHERE GOOD VENTILATION IS REQUIRED,

And as several Sashes may be opened with one action of the Lever or Handle and fixed in any desired position, the Supply of Air can be regulated with little trouble.

This Apparatus is used in place of Cords and Pulleys for Opening Windows. For all ordinary Top Lights over Sliding Sashes, School Windows, Skylights, Dormers, Lantern Lights, Greenhouses, &c., it may be applied with safety. The action of the Lever is so arranged that the weight of the Sash is made to balance against the Rod and Handle; this Balance enables the operator to open or close the Sash by an easy motion without danger to the Glass, the Sash being fixed in any position by means of a simple contrivance in the Handle. Thousands of sets of these Actions have been fixed, and in no case has a failure occurred, or a Broken Window given cause of complaint.

It supplies a Simple, Inexpensive, and Efficient Method of Ventilation for Schools, Offices, Hospitals, Workhouses, Asylums, Billiard Rooms, Conservatories, Stables, and all Buildings where good Ventilation is required.

The following is a List of some of the Buildings where this Apparatus may be seen in action:—

SCHOOLS.

Anglo-German, Brixton

* The weight of an iron rod is made to balance against the weight of a Sash falling to the Room, thereby enabling the Sash to be opened with an easy motion.

THOMAS ELSLEY, METAL WORKER, 32 GT. PORTLAND ST., W.

COMPETITIONS OPEN.

BRIGHTON.—Feb. 1.—Designs are invited for the Madeira Road Improvement. Premiums of 200*l.*, 100*l.*, and 50*l.* Mr. F. J. Tillstone, Town Clerk, Brighton.

HASTINGS.—Jan. 11.—Plans are Required for Altering, Remodelling, &c., the Ground Floor of the Havelock Hotel and Adjoining Premises. Mr. W. Phillips, Secretary, Havelock Hotel, Hastings.

NOTTINGHAM.—March 15.—Plans, Designs, and Estimates are invited by the Corporation for the Erection of Municipal Offices. Premiums to the extent of 600*l.* offered. Mr. S. G. Johnson, Town Clerk, Municipal Offices, Nottingham.

WEST HARTLEPOOL.—Feb. 1.—Plans are invited of a Church for St. Paul's New District, Stranton. Mr. W. D. Ramsey, 1 Bell Street, West Hartlepool.

APPOINTMENT VACANT.

STRATFORD-ON-AVON.—Jan. 8.—Applications are Required for the Appointment of a Borough Surveyor. Salary £220 per annum. Mr. Thomas Hunt, Town Clerk, 1 Scholars' Lane, Stratford-on-Avon.

CONTRACTS OPEN.

ABERDEEN.—Jan. 13.—For Additions, Alterations, and Repairs to Manse and Church of Newhills. Messrs. Wm. Henderson & Son, Architects, 124 Union Street, Aberdeen.

ALSAGER.—Jan. 17.—For Constructing Reservoir at the Hill, to contain 90,000 gallons of Water, and for Laying about 3½ miles of Water Mains, and Erection of a Double-Ram Steam Pump, with Boiler, &c. Mr. Robert Rigby, Audley.

BALLINA, CO. MAYO.—Jan. 12.—For Construction of Water Works for the Town. Mr. Edward Townsend, C.E., Engineer, Galway.

BARLINNIE, GLASGOW.—Jan. 29.—For Supplying and Fixing Two Steam Boilers, Supply Pipes, Six Steam Cooking Boilers, &c. Plans and Specifications at the Prison Commissioners' Office, 130 George Street, Edinburgh.

BELFAST.—Jan. 16.—For the Supply of Earthenware Sewer Pipes. Mr. J. J. Montgomery, Town Hall, Belfast.

BICKINGTON.—For the Proposed Restoration of the Parish Church of Bickington, near Newton Abbot. Mr. R. Medley Fulford, Architect, The Close, Exeter.

BIRKENHEAD.—Jan. 18.—For Alterations to the Birkenhead Post Office. Drawings, &c., with the Postmaster, Birkenhead.

BLACKPOOL.—Jan. 8.—For Roofing Two Platforms at Central Station. Mr. Thomas H. Carr, Secretary's Office, Fleetwood.

CARNARVON.—Jan. 10.—For Erection of Farmhouse and Buildings near Wyenlawr. Mr. J. P. Mumford, Architect, 24 High Street, Carnarvon.

CHELTEMHAM.—Feb. 1.—For Building Central Gas Offices with Residence at Junction of North and Albion Streets. Mr. John G. Dunn, Architect, 44 Waterloo Street, Birmingham.

CHORLEY.—Jan. 20.—For Erection of Shed for the Corporation. The Borough Surveyor, Chorley.

COVENTRY.—Jan. 10.—For Building Class-room at South Street Boys' School. Mr. Herbert W. Chattaway, Architect, Trinity Churchyard, Coventry.

COWLING.—Jan. 10.—For Erection of a Weaving Shed at Cowling, near Cross Hills. Mr. John Judson, Architect, Bogthorne, near Keighley.

DARLINGTON.—Jan. 17.—For Alterations to Post Office. Drawings, &c., with the Postmaster, Darlington.

DUBLIN.—Jan. 17.—For Construction, Delivery, and Erection of Fog Bell and Machinery, North Wall Lighthouse. Mr. Bindon B. Stoney, North Wall, Dublin.

DURHAM.—Jan. 12.—For Providing and Laying 75 lineal yards of 18-inch Sanitary Pipes at Framwellgate Moor. Mr. George Gregson, Surveyor, 1 Sutton Street, Durham.

GLAMORGAN.—Jan. 31.—Applications are required for the Appointment of Three District Road Surveyors. Salary £150 per annum. Mr. Richard Evan Spencer, Clerk to the County Roads Board, Cardiff.

GREENOCK.—Jan. 18.—For Construction of a Kinipple's Wrought-iron Travelling and Folding or Lowering Bridge, &c. Mr. W. R. Kinipple, C.E., 17 West Blackhall Street, Greenock.

GRIMSBY.—Jan. 19.—For Alterations at the Post Office. Drawings, Specification, &c., with the Postmaster, Grimsby.

HALIFAX.—Jan. 12.—For Building two Shops and Warehouse, New South Street. Mr. T. Lister Patchett, Architect, George Street Chambers, Halifax.

HAMPSTEAD.—Jan. 10.—For Construction of Brick and Pipe Sewers (2,270 feet) and Works in Connection. Mr. T. Bridger, Vestry Clerk, Vestry Hall, Hampstead.

HANLEY.—Jan. 10.—For Excavating Pipe Trenches (Six Miles). Mr. G. D. Harrison, C.E., Albion Street, Hanley.

HAWORTH.—Jan. 8.—For Building Wesleyan Chapel at Bridgehouse. Mr. John Judson, Architect, Bogthorne, near Keighley.

HECKMONDWICK.—Jan. 17.—For Building a Methodist Free Church. Mr. Arthur A. Stott, Architect, Heckmondwike.

HENDON.—Jan. 10.—For Construction of New System of Sewers, Outfall and Sewage Irrigation Works and works in connection, in the Parish of Harrow. Mr. W. A. Tootell, Clerk to the Hendon Guardians, Edgware, Middlesex.

HEREFORD.—Jan. 9.—For Removal and Re-erection of Shed from site of new Water Tower to the Corporation Yard. Mr. J. Parker, City Surveyor, Mansion House, Hereford.

HORSFORTH.—Jan. 29.—For Construction of Glazed Earthenware Pipe Sewers, 2,117 yards, with Manholes Ventilators, and Flushing Apparatus. Mr. Wm. B. Woodhead, C.E., 65 Market Street, Bradford.

INVERURIE.—Jan. 19.—For Works in Extension of Churchyard, enclosing Walls, &c. Messrs. Jenkins & Marr, Architects, 16 Bridge Street, Aberdeen.

KILMACOW.—Jan. 31.—For Adding Chancel and Vestry to Church and Sundry Internal Alterations. Mr. J. F. Fuller, Architect, Brunswick Chambers, Dublin.

LEEDS.—Jan. 11.—For Supplying 400 Tons of Cast-iron Pipes, from 3 inches to 9 inches diameter, and Stopcocks, from 3 inches to 9 inches diameter. Mr. Edward Filliter, Engineer to the Waterworks, 16 East Parade, Leeds.

LONDON.—Jan. 30.—For Construction of Wrought-iron Travelling Caisson at Esquimalt, British Columbia, with Keels, Folding or Lowering Bridge, &c. Messrs. Kinipple & Morris, C.E., 2 Westminster Chambers, London, and Greenock, N.B.

LOWER WORTLEY.—Jan. 11.—For Building a Villa Residence in Blue Hill Lane. Mr. C. F. Wilkinson, Architect, 8 Infirmary Street, Leeds.

[Continued on page 4.]

"The name of BOYLE in connection with ventilators has come to be on a somewhat similar footing as that of CHUBB in connection with locks."—British Architect.

UNIVERSITY COLLEGE, LONDON.

STRENGTH OF MATERIALS.

A COURSE of Ten Lectures and Practical Demonstrations on the Testing Machines in the Laboratory, will be given by Prof. ALEX. B. W. KENNEDY, M. Inst. C.E., on Tuesday Evenings, from Six to Seven o'clock, commencing Tuesday, January 9. The first lecture will be open to the public. Fee for the whole course, One Guinea.

TALFOURD ELY, M.A., Secretary.

SALES BY AUCTION.

TUESDAY NEXT.—CHISWICK, MIDDLESEX.

Valuable Freehold Building Land, portions of the Manor House Estate, comprising about 5a. 2r. 0p. and 6a. 2r. 25p. respectively, with long frontages to the old-established parish roads known as Chiswick Lane, Mawson Lane, and Devonshire Road, and unusually well circumstanced for immediate development. The land is situate within a short distance of the main London Road and omnibus route near Turnham Green, and only a few minutes' walk from Turnham Green Station, whence there are trains at frequent intervals to the City and West End (via Metropolitan and Metropolitan District Railways), and Richmond, Waterloo, &c. The Subsoil is sand and gravel.

MESSRS. DEBENHAM, TEWSON, FARMER, & BRIDGEWATER will SELL, at the Mart, on Tuesday next, Jan. 9, at Two, in two lots, the above very eligible FREEHOLD BUILDING LAND.

Particulars and plans may be had of Messrs. Wynne & Son, Solicitors, 31 Lincoln's Inn Fields; and of the Auctioneers, 80 Cheapside.

Tottenham.—Valuable Freehold Building Land.

MESSRS. DEBENHAM, TEWSON, FARMER, & BRIDGEWATER will SELL, at the Mart, on Tuesday, January 23, at Two, in one lot, a very desirable FREEHOLD BUILDING ESTATE, situate in Philip Lane, Tottenham, adjoining the Mount Pleasant and Downhills Estates, and within an easy walk of West Green and Seven Sisters Railway Stations, whence there are excellent services of trains, with workmen's tickets at very low fares. The property comprises in all about 10a. 2r. 27p., it possesses extensive frontages, and presents unusual advantages for profitable development by sub-division, or the creation of ground-rents. Possession on completion.

Particulars of Messrs. Minet, Smith, Harvie, & Smith, Solicitors, 6 New Broad Street; and of the Auctioneers, 80 Cheapside.

TO TIMBER MERCHANTS AND BUILDERS.

—A Spacious Yard and Sawmill, with large House to LET, near Stratford Church, in working order. Machinery by valuation. A rare opportunity for a Timber Merchant with capital.—Apply J. W. MARTIN, Grove Sawmills, Stratford, E.

LINDSAY'S

IMPROVED PATENT

REVERSIBLE TREADS AND LANDINGS

FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK
Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13, 14 & 15 SOUTH WHARF, W.

The Architect.

LESSONS FROM THE GREAT ART LIBEL CASE.

WITHOUT desiring to take sides in the extraordinary dispute which has recently so much stimulated the curiosity and exhausted the patience of the public, we may be permitted to say that it is impossible to pass by the result in respect of certain important lessons which it seems to suggest to artists at large, and to those who are more or less connected with art, whether as business or recreation. In the interminable records of English litigation there is probably no other case to be found in which the same situations have arisen, and if we venture to hope that a similar case may never again come to be discussed in a similar manner there are few people of good sense or good feeling who will wish to contradict us.

What strikes artistic minds first and most forcibly is the intellectual scandal which is involved in the mere act of wrangling about artistic matters before such a tribunal; and when we find a Baron of the Exchequer, at the end of an incredible number of weeks wasted in such controversy, urging upon a jury of plain citizens the shrewd advice, not only to keep their reasons to themselves, but to avoid even the simplest expression of their views, lest their verdict should be technically invalidated by their frankness, we may suppose the whole world of imaginative people to be justly shocked. To decide a question of art without giving a reason—a question of artistic reputation without a word of sympathy or blame?

But to explain this state of things one thing must be remembered particularly; the cause of action was not primarily a dispute amongst artists, but a scandal between an artist and a newspaper, and, let us say at once, a "society paper." The point which the learned judge on the bench and the twelve respectable persons in the jury-box had really to try was whether this society paper had a right to drag an individual artist out of his private studio, as it were, into the public street, and there to whip him soundly for the amusement of its "readers." The verdict of a dozen Englishmen upon this question could scarcely be expected to be otherwise than a rebuke of some severe sort to such aggressive journalism, and those who care to speculate upon the secrets of the jury-room may be right in the opinion that the short time which was occupied in settling the verdict was really taken up in coming to an agreement upon the amount of damages alone. We are not going out of our way if we repeat the observation which is heard on every hand, that journals of that class are a great deal too numerous and a great deal too mischievous. The very existence of such literature is foreign to the genius of healthy-minded English people. They live in privacy, and not on the boulevard. The affairs of their domestic life and of their personal business are held to be sacred. The whispers of scandal may be irrepressible, but in England they are at any rate whispers. It is not merely pietists and prudish people who point to the fact that the kind of journalism which the verdict in the BELT case has so peremptorily dealt with is a thing of yesterday amongst us; and probably it would be difficult to find a jury, in London or out of it, who would have any hesitation in signifying their appreciation of its moral value in pretty much the same way as this jury has done. The actual decision in this case is clear enough;—that a society paper shall not be allowed to amuse its readers by speaking too plainly concerning personal qualities. A man has his bread to earn in business under the safeguards of the common law, and so far it is useless to suppose that the verdict of the jury is not that of the public at large.

Let us now, however, look beyond this more simple issue, and take into consideration the behaviour of our Courts of Law—as very fairly represented by Baron HUDDLESTON and the learned counsel who wrangled before him for so many days—when they have "artistic merit" to deal with, and the processes by which it is achieved. We have already said that the whole administration of such wrangling is intellectually dis-

creditable, and we think there will be very little difficulty in proving this.

The jests which from time immemorial have been so freely indulged in about lawyers are familiar to every one, and it is by no means the least conspicuous joke in the budget that the lawyers themselves indulge in the joking more freely than any one else, whilst their clients, we must also especially remember, do not indulge in the joking at all. The plain meaning of it is that in England, and particularly in London, the highly artificial processes by which justice is done between man and man, in those everyday disputes which it is almost the first function of every commonwealth to adjust as readily as possible, are in practice very much of a failure. It has actually and notoriously come to this—that no man has any confidence in the result of an application to a Court of Law. The only certainty is that enormous costs of wrangling will be incurred. The story is so well known as to be scarcely worth repeating of the old judge who, on expressing himself privately, as all judges do, wholly averse to litigation, was asked what he would do if a man should sue him for a hundred pounds which he palpably did not owe. He would pay the money without any hesitation, was the answer, together with a considerable further sum for costs. This is all very well as a joke, but, as representing a fact in our social system, it is far indeed from a joke; and a question which arises on every side is this:—If in the commonplace transactions of commercial dealing, which everybody understands, it is found to be better to submit to wrong than to seek redress from the law—or rather, let us say, from the lawyers—what must be the state of the case when the subject of dispute is something quite out of the line of what everybody understands, or even something which nobody pretends to understand except professional specialists, whose particular understanding has cost them a lifetime of study? A better answer to this inquiry could scarcely be offered than a simple reference to some of the evidence and arguments of the BELT case—expert artistic evidence submitted by the most accomplished critics in the kingdom to the judgment of a mere haphazard jury of respectable wayfarers, and argument elaborated thereon by forensic fighting-men, to whom the whole affair, to say the very least of it, was one of words and not things, and of the imputation of the meanest of vulgar motives rather than the consideration of those elevated feelings without which artistic life would be not worth living. Of course we are again and again met by the fact that the jury were in reality not dealing with the artistic question at all, but with the society paper question; but the misfortune to English art is the same, and the scandal to all high-minded artists the same, both at home and abroad.

What we will take leave to regret especially is that some of the distinguished Royal Academicians who found themselves forced into the witness-box—even without their consent being asked—did not take the opportunity of asserting the artist's position in a way which would have astonished the lawyers. It could have been easily done, and it might have made one's fortune; it certainly could scarcely have marred it. A better occasion for the manifestation of a little disdainful self-consciousness there could not have been. It was quite understood that the Academicians appeared in a perfectly impartial character; in fact they had been somewhat unwarrantably subpoenaed by the defendant wholly on speculation, and might therefore have been supposed, according to ordinary rule, to have a bias against the side which called them. And yet it could be plainly seen that their evidence was not to be accepted as it ought to have been; it was "theoretic opinion," a sort of intuition all very well in its way, but not for a moment to be weighed against the "direct evidence" of people who saw this and heard the other, even if it were without understanding either. The reason why the "theoretic opinion" of a thorough expert is better than the "direct evidence" of a know-nothing is what the lawyers can never see; and we think it is a pity some of the R.A.'s did not boldly say so in strong language.

Not only in pure art, but none the less in such business as that of architecture and commercial art of every kind, it is perfectly idle to submit any question whatever to a legal tribunal. The "trained intellect" of the lawyer is trained quite away from the understanding of such matters, and the consequence is that words take the place of things from first to last. A reference to an expert arbitrator is the only adequate remedy; and the most fatal blunder which such an adjudicator could make is much less to be feared than the inevitable false issue by which alone the legal mind can deal with the case.

It is scarcely our province to comment upon the unconscionable time over which the BELT case was made to drag, but every person who has the cause of common sense in business at heart must see the need of protesting against the waste of time and waste of money which seems to be almost encouraged nowadays in the trial of questions of what is called public interest, otherwise private scandal. It is not too much to say that an artist-referee would have seen his way to a decision upon every possible point of art in the case in question within a day or a couple of days at the utmost, the famous experimental bust not excluded; and if the jury had been permitted to look into the other points in the way of plain men of business, it is not likely that they would have seen any necessity for spending a long time over the investigation. We will only say further, that if to "the glorious uncertainty of the law" we are now to add as a customary thing the sensational development of gladiatorial acumen which has occasionally been displayed of late years, the sooner Mr. ARTHUR STREET and Mr. BLOMFIELD are instructed to put a extra storey on the new Palace of Justice the better.

ROYAL ACADEMY.—WORKS OF D. G. ROSSETTI.

THE remonstrances made by the Press and otherwise against the overcrowding of the room set apart at the Royal Academy for ROSSETTI'S pictures were not unavailing, and the President, with his usual desire to show justice all round, had this part of the exhibition rearranged at the end of last week. The more important oil pictures remain in Room V., and the rest, with the water-colours and chalk studies, are hung in a screened-off portion of the next gallery.

A poet-painter who secluded himself from ordinary society, whose studio was only visible through favour, whose works passed for the most part directly into private collections, and though they might by chance find their way into auction-rooms, never ran the gauntlet of public opinion on the walls of exhibitions, was of course the subject of a curiosity which extends to his artistic productions, and spreads over them a certain artificial notoriety. Clique favour and clique prejudice alike affect the reception of Mr. ROSSETTI'S collected pictures, and an idle buzzing of gossip clouds the judgment of the average. Nevertheless the tribute of respect paid by the Academy to the position of this distinguished "outsider" will not fail of endorsement by the majority, and although many pictures which might have been, and some which should have been, are not here, yet even people who may not see the forthcoming collection at the Burlington Fine Art Club, have before them in the Academy a quite sufficiently representative selection on which to form their judgment.

In date thirty-three years are covered by the work, and the mental progress of the artist through the spiritual romance of his early pre-Raphaelite phase to the intellectual and emotional romance of his mature life can be traced as easily as can the development of his artistic faculty and technical skill. It has been stated in a recent memoir that ROSSETTI smiled in later life over the enthusiasms of the pre-Raphaelite brotherhood which he had himself shared and enriched. Nevertheless the student of his work will feel that, if great gain was made when those youthful enthusiasms were left behind, something also was lost. The "stained glass colouring" of the early pictures, especially water-colours, developed into a system of splendid and audacious colour, which must be accepted as advance; but the passionate devotion, the beautiful tenderness of expression to be found in pictures which might in drawing be affectedly archaic, and, in ordering of subject-matter, childish or strainedly symbolic—these are qualities which were lost for the worse when replaced by a sensuous mysticism. As examples of the early work possessing such high qualities of expression and much beautiful quality of colour, take the embracing lovers on *Carlisle Tower*, 1858; the impressive *Mary in the House of John*; *The Wedding of St. George*, so charming and fanciful in design; *The Gate of Memory*, with its lovely study of children; all belonging to 1857, though the last pathetic illustration to Mr. W. B. SCOTT'S ballad of *Rosabel* was retouched in 1864; again, *Bethlehem Gate*, *Paolo and Francesca*, 1862, an original design, splendid in colour and intense in expression; *Hamlet and Ophelia*, 1866. The earliest picture, *Childhood of Mary, Virgin*, date 1849, is poetic and tender, but self-conscious and

exaggerated in *naïvete*; the diptych *Salutatio Beatrice*, 1859, also shows the artist hampered by a certain formalism, and imperfect in his command of the figure on an extended scale. Still, as we have said, there is a power of pure, yet passionate expression in all these pictures, which only occasionally reappeared in later years under the inspiration of the great Florentine poet, after whom the artist was named.

It cannot often be said of a man that posterity will be doubtful whether to rank him highest as a poet or a painter; but in ROSSETTI'S case such hesitation may well arise. To our own thinking, the poetic faculty was stronger than the artistic; and the fervid imagination and speculative phantasy of this poet-painter, while it stamps his pictures with an emotional and intellectual originality, yet in some cases directed his pencil to attempt subjects, or rather a treatment of subjects, which was more literary—if we may say so—than artistic. A poet may, for example, be haunted by a type of beauty and never tire us with setting forth the particulars of its charm to himself, but the visible, tangible art of the painter runs certainty of monotonous repetition if he reproduce the image that follows him. Whatever may be the taste of the onlooker as to the attraction of the melancholy type, to which ROSSETTI gave his allegiance, spectral-eyed, crowned with heavy masses of dark hair, large-lipped, heavily full-throated, massive of contours, with long-drawn hands—however, we repeat, such a type may affect the taste of the onlooker, there is no doubt that its constant repetition under divers names and characters becomes wearisome even to repulsion. There was another face, however—that which the painter used for the mystic and most beautiful picture of *Beata Beatrix*—that lent itself gratefully to idealisation. Also, when the subject for portraiture was fortunate, we see in that completely-wrought little painting, *Il Ramoscello*, how tenderly the artist could treat it. The third face most often used by the painter, which is displayed in the more gorgeous than harmonious splendours of *The Blue Bower*, and in the smaller picture, probably the best piece of work in the room, *Bocca Baciata*, pale and luminous of skin, ruddy of locks, has the sensuous attraction that borders occasionally on the merely animal.

Fronting one another the hangers have placed the two largest works—the triptych altar-piece from St. David's Cathedral at Llandaff, and the *Dante's Dream*, which was acquired by the Corporation of Liverpool for the town gallery, and which has been described at length in our columns more than once. The Llandaff picture loses in a picture exhibition. The somewhat quaint drawing and rich sonorous colour tell best in the place for which they were designed—among the cool tones of the grey church, where the picture glows like a jewel. The *Dante's Dream*, stored with poetic invention, full of artistic expression, and finely ordered in colour, must go down on the whole as the noblest work of the artist, although in the final arrangement of the completed design, which was altered from its first plan, it were easy to find fault, and though in technical matters, such as cast of drapery, the painter was not throughout at his best. He worked at the picture over too long a period, and not always when in possession of his full vigour.

If the student looks carefully through this collection of pictures, including the chalk studies—a branch in which the artist's skill was supreme—he will mark that by degrees Mr. ROSSETTI attained to great mastery in his art. His drawing steadily became assured; his modelling of hands especially is exceedingly sensitive and beautiful; his workmanship and management of material attained great completeness and finish, and the brush or the crayon became exactly responsive to his will. The love of splendid colour, the delight in rich objects, curious jewellery, quaint stuffs, texture and form and glory of flowers, increasingly absorbed him, and in some of his pictures—*The Bride* and *Monna Vanna* are apt examples—he seems to revel in thus surrounding and decking his pictures of women. No one has more ingeniously or audaciously combined contrasting and various colour: save in Oriental stuffs or ceramics the like has hardly been seen. Some of his designs are treated indeed with a decorative affluence that overpowers and swamps the sentiment. Mr. ROSSETTI'S pictorial rendering of his own poetic thoughts gives sometimes an unfortunate interpretation of his words: as, for instance, the *Blessed Damozel*, which certainly has none of the ethereal quality of the poem. He did not often, after his early years, paint compositions of many figures. To choose a single female figure, to imbue her with mystic attributes, surround her

with suggestive objects, and endow her with superb colouring, seems to have given him most pleasure, and such studies are among his best efforts. The melancholy lady in the blue drapery, sitting on the bough of a sycamore tree, called *Day Dream*; the noble study of the same model as *Proserpine*; the *Vision of Fiammetta*, standing robed in red amid abundant apple blossoms; and the somewhat showy figure, *Astarte Syriaca*, are instances.

It is impossible to measure ROSSETTI'S art by conventional standards; the wisdom of the resolution which he took, to keep his pictures away from the walls of ordinary exhibitions, is justified by this collection of them. The mental impression which he seeks to convey depends for full effect on a concentration impossible amid the clashing incongruities of an exhibition room; his system of colour, though of value to make any neighbouring pictures look bleached, is so dexterously adjusted that an unfortunate juxtaposition can throw it all out of balance; and it must be added, certain unpleasant peculiarities in his treatment of the female type—the extraordinary ringed throat, inflated, almost convoluted, like a gorged boa constrictor; the thick-lipped feverish mouth—these traits, when driven to the excess implied by these epithets, would have told with still more objectionable force in a mixed exhibition. But let the artist's mistakes have been what they may, he united rich poetic thought and executive skill in a combination that can only rarely occur, and the result, as set before us, is an æsthetic feast not likely to be spread more than once in a lifetime.

THE INTERNATIONAL EXHIBITION OF PAINTINGS IN PARIS.

[BY A CORRESPONDENT.]

A CORRIDOR hung with Flemish tapestry, a staircase of the yellow marble of Languedoc, leads to the gallery in the Rue de Seze, lighted by eight-and-twenty brass candelabra, in which the International Society holds its first exhibition. Following the hospitable example of the Acquarellistes, the Society allows its doors to remain open until 11 P.M. On the committee M. JACQUET represents France, Mr. SERGENT America, M. EDELFELDT Germany, M. TOFANO and M. GEMITO Italy, and M. EQUESQUIZA Spain.

The visitor to the gallery is soon impressed by M. EDELFELDT'S *Sous les Bouleaux*, which has been lent by the Empress of Russia. The birchwood is bare of undergrowth. The soft light of early spring therefore penetrates to its furthest edge. Far away to the right, dimly seen between the stems of the young pine and feathery larch which fringe its shore, lies a lake, set at the foot of hills grey blue in the distance. Of the forest trees we see but the straight trunks—their branches, beyond the canvas, throw the scene before us into half light. On a knoll gathered over the gnarled roots of an old oak, its trunk all scarred and marked by moss, a lady clad in palish shade of yellow, her face shaded by a bonnet of pale pink, is seated; her head is bent over the "Tasso" on her knee. A few feet to her right a child lies stretched, half sunk in soft moss; her straight auburn hair tangled in knots of tall grass, she poises a reed on her forehead. A sapling ash, like herself the growth of some six summers, casts its shadow on her frock. Huge granite boulders partially carpeted by dark velvet moss lie around. The rich loamy soil is yellow with pine needles and fallen leaves. A sunbeam glinting on ground ivy and trailing beyond turns their polished leaves to emerald and ruby. There is a stillness in the atmosphere only known in far-away and lonely forests, broken by the cooing of the wood-pigeon, for the child gazes upwards and listens. Above *Sous les Bouleaux* hangs M. DUEZ'S view of intensely green downs stretching seawards. The sun, a ball of red fire, drops below the horizon, tinging with flame-colour a pool of calm water between rocks.

A frame and only a frame is scarcely a legitimate object by which to attract attention, yet genuine art is manifested in the frame of wood, green with mould, with its narrow carving from which centuries are supposed to have effaced the gilding, in which it has pleased M. VAN BEERS to enshrine a nineteenth-century person in lemon draperies. To the lady herself, taking her ease on a couch, we prefer the same artist's exquisite woman's head swathed in veils of snowy whiteness; in the depth of the grey blue eyes there is poetry; in the curves of that lovely mouth a sad sweet smile, as fatal as was GUINEVERE'S. The "clan" of the Exhibition (to use the jargon

of the studios) among the French works is BAUVERET DAGNAN'S *Vaccination*, on account of its true but luminous colour. In the class-room of a country school, peasants, each with her child, await their turn, while the village doctor, seated at a window which opens on a hilly country, operates on a chubby boy seated on its mother's knee and enveloped in a blanket. A coloured handkerchief is lightly folded round her head, seen in profile. A girl of ten, partially unclothed, stands by her grand-dame, who carries her baby brother. A sunbeam turns to gold the fluffy hair of the little patient, glints on the girl's shoulder, and strikes a patch of light over the large map which hangs on the wall behind several young mothers seated on a bench gossiping, while their babes in their laps display their rounded limbs in every imaginable position. The picture is interesting because of the knowledge it shows of child-life. The women's heads, enveloped in folded bandanas, have a sameness of expression, but no portion of the work is monotonous.

In a totally different key is the same artists' *Interior*, by which he proves to us he can paint deep tones of rich colour on Persian carpets, catch bright lights on the steel-grey velvet of a table-cover, and delicate pinks in the draperies which clothe the graceful figure of a lady reading—an occupation she is not destined to continue uninterrupted, for the arras of yellow-gold tapestry moves, and her little daughter peeps from behind it. BASTIEN LEPAGE, in his shoeblack of the Red Brigade, leaning against a pillar-post in Regent Street, a box of blacking at his feet, at once excites pity, he is so thin, pale, and weary; but even more sad is the expression on the pinched but delicately-drawn features of the flower girl, who huddles her grey shawl over her benumbed fingers and shivers beneath her skirt of lilac cotton. It is a remarkable work, especially for a foreigner to produce. As wan and poor, but of a different type, is the French peasant child, who has gathered cowslips in the neighbouring wood. Her brown striped petticoat and jacket of frayed fustian, her long thin boots, cover a skeleton. The child consists mainly of sad brown eyes, a sorrowful mouth, and a shock of tangled hair. There is enough local colour in the same artist's view of the Thames on a fine day, but with the atmosphere impregnated with grey mist. Following a steamer making her way to Gravesend are some coal barges. Two wherries are lying at anchor. Along the shelving bank beneath a quay lie several small boats. The swirl of the eddying river reflecting the grey sky in its turbid surface, the burden of mist in the distance, the sense of damp and cold is faithfully rendered, and by no means exaggerated.

Seven of the nine works M. CAZIN exhibits are sold. Like HULBUTH, M. CAZIN can *peint à côté de la lumière*; he seldom floods his canvas with brilliant light. On the right as one enters the gallery (hung immediately beneath a young person singularly repulsive to our idea, seated in a meadow, her croquet bat and ball at her feet, and scattering the petals of a daisy, whereby she gauges her lover's fidelity), is M. CAZIN'S *Orage*. A road, not worn by traffic—for the dull grey grass of the sloping hillocks on either side overgrows a third of its width—leads straight to the shore. The dwelling of the coastguard is on the rising ground to the left. The great plain of water lies beneath a sky covered by fast-flying clouds, each looking as if it were a sheaf of lighted rain. One is reflected on the face of the ocean in a patch of fainter hue; behind it a purple veil of passing mist gathers into a mass of violet, as the wind sweeps northwards. The soft blue of higher space is above these rain-clouds, and far below on the horizon silvery vapour lies in flakes, making it difficult to trace the sea-line. In *La Nuit Etoilée* the sky is dark and serene as the light in a sapphire stone; the stars but make its intense stillness visible, and show the two cottages perched on the rising over the road, two or three reflecting their faint light on the surface of the mere behind the houses. Silence and profound stillness pervades *La Nuit Etoilée*, to the rendering of which M. CAZIN is prone, for the same sense is conveyed in his views of an agricultural district and with a charm which fascinates. In *Le Blé* he shows the soft grey light of an autumnal day. There is a red-tiled farmhouse, with its potato garden almost dug, for the sacks in the foreground are half filled; the broken earth is divided by rough palings from the fields, now covered by grey-green grass, wet from heavy rains. A clump of pale yellow colza has grown up between the broken earth and the field. A sky charged with rain-clouds overshadows the scene. The charm is created by its intense truth, but there is, moreover a dreamy poetry about it which is difficult to define.

M. BÉRAUD is not a dreamer; the *Boulevards by Electric Light* is graphic—the badauds grouped round the kiosque clamouring for the latest edition of *La Lanterne*, the white-aproned waiter interviewed by the girl of the feathered hat, the calm gentlemanly Englishman passing by, the gamin selling violets are characteristic of Paris. The *Sortie de l'Opéra* is very clever, especially as regards the physiognomy of the footmen waiting for their master's carriage to be called. M. TOFANO'S *Sur la Terrasse* is a pleasing picture of a lady ascending the steps of her terrace, fresh from the cool woods in the background, where she has gathered all manner of lovely flowers. The day is intensely hot, so she is sheltered by a sunshade of soft gray silk, through which however the sun casts shadows of the flowers in her hand, and the lace of her parasol on the folds of her white dress. Thrown out by the dark plush which frames her portrait is an exceedingly charming pastel-drawing of Mlle. DE F——. Her southern complexion is ivory pale, but flushed now by a faint tinge of pink from the bonnet which overshadows; the colouring of orange carnations in her bosom is excellent. This is not the only pastel-portrait by M. TOFANO, but probably the more charming of the two exhibited.

Mr. SERGENT, whose name stands at the head of art in Philadelphia, has returned from Spain with a well-filled portfolio of admirable scenes of Spanish life, as clever and spirited as are his Arab sketches exhibited at the Cercle de la Seine. Especially noteworthy is the intense tone of his colouring in his groups of children, evidently studied from VELASQUEZ. M. EGUSQUIZA'S *Last Valse* is entraining. The brilliant costumes of the guests at the fancy ball, although varied, are perfectly harmonised; their movements are graceful, and the general effect is pleasing.

In conclusion, a couple of works of sculpture may be mentioned. A splendid work is M. GEMITO'S *Pêcheur*, in bronze, the property of M. MEISSONNIER; and as striking is the smaller bronze entitled *Porteur d'Eau*, a title which by no means expresses the charming head of the boy with his frayed scull-cap and water-bottle huddled under his chin. The modelling of the child's head, the soft fleshiness of the face, the perfect roundness and childlike character of the features, are worthy of all praise. There is an unfinished appearance in the treatment of the subject which recalls the manner of the early fifteenth-century sculptors. Something is left to the imagination, details indicated but not defined, yet having an inexpressible charm. The head is in small life, and done in Roman bronze. The *Pêcheur*, his figure poised on his heels, holds his fishing-rod in act to throw, nude but for his cap. The boy is life-size.

THE EARLY YEARS OF RAPHAEL.*

FOUR hundred years ago—in what month is uncertain—RAPHAEL SANTI was born in his grandfather's house in Urbino. GIOVANNI, his father, was a person of some consequence in the town: he owned houses and fields, could paint pictures and write verses, and was on friendly terms with several artists. RAPHAEL was a delicate boy, and it seemed to be probable that, like the other children of his father, he was to die young. But he lived for thirty-eight years, and although the time was too short for the full development of his powers, the works produced by him have placed him first among painters. To us RAPHAEL is a phenomenon. His life was a succession of victories, but they were easily attained. Other artists are examples of the truth of the old Greek proverb which tells us that pain is the price to be paid to the gods for what is good. In painting, RAPHAEL never knew what pain meant; toil was to him a pleasure. He was as able to accomplish all he undertook as if his pencil was an enchanter's wand, and the only difficulty with him would be to draw a line which was without beauty. Although in the sixteenth century the greatness of RAPHAEL was recognised and he was called "Il Divino," it is strange that no Italian was found to collect much information about him. VASARI jotted down a number of statements relating to RAPHAEL, but never troubled himself to verify them; and not only is his memoir incomplete, but it is not free from the prejudice that was natural in a follower of MICHAEL ANGELO. In spite of its defects, VASARI'S sketch was made the basis of all memoirs of RAPHAEL

until almost our own times, when efforts were made by PUNGILEONI, ROMOHR, and PASSAVANT to test what was recorded, and to extend the information. Messrs. CROWE and CAVALCASELLE have followed them, and with their unrivalled knowledge of Italian art, which has been derived from laborious investigation, the public may expect a work which will set RAPHAEL'S pictures in a new light.

The first volume narrates the painter's life up to the time when he was summoned to Rome by JULIUS II., and the surprising spectacle was seen "of a youth of twenty-three suddenly elevated to the highest rank in the hierarchy of his guild, in whose favour all the oldest and best-tried craftsmen of the Italian peninsula were unceremoniously turned out and sent about their business." Wherever evidence is forthcoming it has been utilised in preparing the book. But the plan has also been adopted of suggesting or conjecturing what was possible, although there may be no record of it of a kind to satisfy a lawyer. This plan is all that is available in the case of SHAKESPEARE, and we are obliged to have recourse to it occasionally in the case of others besides RAPHAEL. It is easily abused, but with true scholars like Messrs. CROWE and CAVALCASELLE, whose imaginations are under control, it can be made a benefit. In the case of RAPHAEL it has peculiar advantages. His character has to be derived from fragments of information which were recorded for another purpose. We may assume, for example, that he was marvellously susceptible to outward impressions. The sight of MICHAEL ANGELO'S cartoon caused him to revolutionise his style, and he derived instruction from the works of men who were much inferior to himself. Is it not, then, reasonable to suppose that the events of his time, the scenes which were transacted before his eyes, were also inspiring, and that human life was as useful to him as the fresco representations of it? The story of his painting one of the best of his Madonnas (the *Della Sedia*) in the market place suggests how well he could appreciate reality. We know it, too, by his sketches from life, which have been employed for figures that are often supposed to be inventions. In Messrs. CROWE and CAVALCASELLE'S book we see, as it were, the things by which RAPHAEL was surrounded, and which, as happens with other men, had much to do with the shaping of his thoughts.

From the beginning of his life RAPHAEL was affected by circumstances which were always turned to his good. His father was opposed to foster-mothers, and, consequently, he was nursed by his own mother MAGIA. She lived until he was eight; and it is not going beyond probability to assume that his delight in repeating representations of the Madonna, his apotheosis of maternal love, worth, and duty, which, according to DAVID SCOTT the painter, is the central idea of his works, was a tribute of affection from RAPHAEL to his mother.

His pictures are, too, in other ways, reminiscent of his home. GIOVANNI SANTI painted in the Umbrian churches, and the pictures were prized and followed by his famous son. According to Messrs. CROWE and CAVALCASELLE, the *Resurrection*, in the Vatican, has its counterpart in a work of GIOVANNI'S at Cagli. The *Virgin with the Finch*, at Berlin, recalls the father's *Virgin with the Pink*, in the Fano Hospital, and many works which are related in the same way might be mentioned. Even in RAPHAEL'S later works, when his style had gone through several transformations, there are occasional suggestions of his father's figures. We may suppose "either that filial piety induced the youth to make a pilgrimage to the altars on which the works of his sire had been left, or that he inherited the drawings and sketches which SANTI had collected and preserved." Homeliness underlies his most sublime things, and it is the quality which ensures universal admiration for his works. It requires a sort of education to appreciate DA VINCI, ANGELO, FRA ANGELICO, BOTTICELLI, MANTEGNA, but RAPHAEL can always be understood by the multitude. As EMERSON says, his pictures domesticate rather than dazzle us, and, in his last and greatest work the familiar, simple, homespeaking countenance of the transfigured CHRIST "is as if one should meet with a friend."

Whether it was fortunate or the reverse that the master of RAPHAEL should have been PERUGINO rather than SIGNORELLI, there can be no doubt that the gentleness of the boy was more in keeping with the placid saints of PERUGINO. It was asserted by VASARI that GIOVANNI himself brought his son to Perugia. But this seems to be incorrect. The father died in 1494, leaving RAPHAEL, who was then only eleven, to the care of an uncle—a priest who unfortunately took pleasure in litt-

* "Raphael: His Life and Works. With Particular Reference to Recently Discovered Records, and an Exhaustive Study of Extant Drawings and Pictures." By J. A. Crowe and G. B. Cavalcaselle. London: John Murray.

gation and in consequence brought trouble to the family. At what time RAPHAEL left URBINO is not known, but it may be assumed that in 1495 he was taking lessons from PERUGINO, and that he knew something of the use of paints and brushes before he came to Perugia. The sentimentalism of PERUGINO met the public taste, and his works were in such demand for churches, that he kept a workshop in Florence as well as in Perugia. The relation between RAPHAEL and his master has long been a puzzle to critics, and the same works are sometimes ascribed to one and sometimes to the other painter. PERUGINO's success made him a mannerist. Having a large number of works to produce, he adopted a system by which production was made easy. He had fixed ways of posing his figures, arranging the draperies and expressing feeling, and his works on this account suggest some of the secrets of an Italian studio. But those ways were not bad in themselves, and what was done by PERUGINO was proof of the existence of a theory of art in his mind which must have been the result of study. Figures could be constructed mechanically in his workshops by PERUGINO's assistants (he boasted that he never robbed anyone but himself), but a genius like RAPHAEL would, in adopting the types, give new life to them. RAPHAEL's conscientiousness in adhering to a model was not the least remarkable of his gifts. Sir JOSHUA speaks of a study for the *Dispute of the Sacrament*, in which all the figures are represented with the cap worn by the model, "so servile a copyist," says the President, "was this great man, even at a time when he was allowed to be at his highest pitch of excellence." It was through this conscientiousness that in his apprenticeship RAPHAEL became more Peruginesque than PERUGINO; he divined what his master was aiming at, and in such a picture as the *Sposalizio* we seem to see old PIETRO at his best, and for once ceasing to be a manufacturer. That the master recognised his own thoughts in his pupil's work is evident when we find PERUGINO painting figures underneath a fresco of RAPHAEL's after the death of the latter and without any misgiving as to difference in style.

The progress of RAPHAEL in Perugia is traced by Messrs. CROWE and CAVALCASELLE with as much minuteness as is practicable from the materials which exist. All the drawings which remain of the famous sketch-book in Venice are analysed carefully, and they indicate the application of RAPHAEL in his student days. He must have had a reputation for industry. MICHAEL ANGELO once asserted that RAPHAEL was indebted for any excellence he possessed to long study rather than to natural ability. But however true this may be (and it was in REYNOLDS' mind when he told the Academy students that nothing was denied to well-directed labour), it is evident that while in PERUGINO's studio RAPHAEL's labour was extended beyond the tasks which were assigned to him; and while loyal to his master, he was not forgetful of his own interests. One passage may be extracted to suggest the workings of his mind when a student:—

Whilst RAPHAEL thus devoted his time to close study, he was still under the orders of the superiors to whose commands he was subject by duty as well as by habit. He had no dispensation assuredly to neglect the work of an assistant when his master presided in the painting room. At such hours as he laboured for himself, or for his own instruction, he was free to do what he pleased. At other hours he was bound to think exclusively of the subjects which PERUGINO was commissioned to execute. But this constraint naturally produced a mental thralldom which caused the circle of ideas in which he moved to become identical, so to speak, with that of the artist who directed him. Once in early days his mind had been filled with the beauties of the subjects which PERUGINO transferred to the predellas of Fano. Now he dwelt with reverent fondness on the compositions which in numberless instances engrossed the time of his chief. Was he aware that PERUGINO recollected the *Sposalizio* of ORCAGNA when he composed the same episode for the brotherhood of St. Joseph, at Perugia? His lively recollection of this masterpiece was certainly shown in the later development of the same theme at Città de Castello. When PERUGINO consented to depict the *Coronation of the Virgin*, for San Francesco, of Perugia, RAPHAEL brooded over the legend preparatory to its repetition in the altar-piece of the Vatican. He thought out the *Trinity* and *Crucifixion* of Città de Castello after seeing PERUGINO's earlier sketches and cartoons. Yet in the ordinary forms which painting took in those days, RAPHAEL, though mindful of PERUGINO's bidding, seems always to have tried to improve on the conceptions of his master.

One of PERUGINO's principal craftsmen was BERNARD

PINTURICCHIO, and it has been supposed that RAPHAEL was among the pupils and assistants assigned to him when he contracted to paint the room where the choir-books were kept at the cathedral of Sienna. It is a belief in Sienna that RAPHAEL did paint part of the ceiling. But there is no authority for the tradition. How far he assisted is a question on which the critics are not agreed. BURCKHARDT maintains that there is nothing which might not have been done by PINTURICCHIO. Messrs. CROWE and CAVALCASELLE consider that PINTURICCHIO furnished the rough drafts from which, with the help of occasional appeals to nature, finished drawings were prepared by RAPHAEL. But it is suggested that drawings were not necessarily made in Sienna, and the character of some of the details confirms this view. At the same time, the sketch of the Graces, which is in the sketch-book at Venice, represents a group which was then in Sienna, and is consequently evidence that RAPHAEL visited that town.

RAPHAEL, during his apprenticeship, occasionally returned to his native Urbino, and he secured the patronage of the duke and duchess. It was supposed that the duchess gave him a letter of recommendation to chief authority in Florence, but doubts have also been expressed as to the probability of so much kindness being displayed. Messrs. CROWE and CAVALCASELLE regret the doubts, but they are obliged to own that there is no evidence of the existence of the letter, and therefore it must be ignored. Still it is probable that about the end of 1504 RAPHAEL did visit Florence. It is evident from his sketches that at that time he came under some new influence. The provincial Umbrian manner is exchanged for "the more skilled and intelligent style of the greater Florentines." A more fortunate time could not occur for a visit to Florence. DA VINCI and MICHAEL ANGELO had just completed their great cartoons, and the sight of them would work wonders in a mind like RAPHAEL'S. A new power also arose in the Dominican monk FRA BARTOLOMMEO.

Florence opened a new field to him, in which he observed that artists were not working from set forms, but in obedience to principles and laws. He was no longer a child who had a lesson to learn, but a man with unusual acquisitive propensities; not like BAGIARDINI, whom MICHAEL ANGELO called happy, because he was content with the little he had learned, but a craftsman who had acquired much yet wished to acquire more. He saw LEONARDO'S masterpieces without that material craving for imitation which had beset him in Perugia. He took hold of the maxims which DA VINCI had taught, not of the very shapes which he had painted. He made LEONARDO'S lesson a study, and became his disciple in a far higher sense than he had been the pupil of PERUGINO. . . . With the reappearance of FRA BARTOLOMMEO a new life was given to the art of LEONARDO. RAPHAEL seized the favourable opportunity, became the intimate friend of the Dominican, and, incredible as it may seem, gave him lessons in perspective. The fruits of this intimacy were not slow in appearing. RAPHAEL patiently continued to apply the precepts of LEONARDO in the pictures which he executed; but he modified some of the lessons of his manner in obedience to the lessons of the friar, and came at last to embody many of the qualities which distinguished that remarkable painter.

It has been regretted that RAPHAEL did not come more directly under the influence of LEONARDO. If DA VINCI had been his master instead of PERUGINO, who can say to what heights art would have reached? When we read the analysis of RAPHAEL'S works which has been prepared by Messrs. CROWE & CAVALCASELLE, it becomes plain that RAPHAEL recognised in LEONARDO the genius from whom he had most to learn. But there was much which he could not attain, and the mysterious expression which attracts and subdues the spectator in DA VINCI'S works could no more be imitated by RAPHAEL than by lesser artists. What is marvellous is the ease with which he made the works of so many men yield profit to him. RAPHAEL was in truth the prince of eclectics. The simple Umbrian painters as well as the great Florentines, PERUGINO, with whom he remained for years, and MANTEGNA, of whose work he may only have seen a stray example, were all utilised, and, what was more difficult, the qualities which were derived from them, no matter how diverse, were fused into a style which might be said to be perfect in its unity. The extraordinary spectacle was seen in RAPHAEL of a painter having something in common with the miniaturists and with the largeness of MICHAEL ANGELO; with the dainty affectation of PERUGINO and the breadth, simplicity, and humanity of FRA BARTOLOMMEO; with the portraits of DA VINCI and the figures of those who passed through many tribulations which were drawn by MANTEGNA and FRANCIA,

In course of a few years RAPHAEL exemplified other influences, some of them being less worthy; but that period has yet to be described by Messrs. CROWE and CAVALCASELLE, and we trust that ambassadorial and other functions may not long delay the publication of the remainder of their book.

THE LATE J. B. A. CLÉSINGER.

A TRUE artist was the late JEAN BAPTISTE AUGUSTE CLÉSINGER. His death, while Paris still echoes the military salute fired over the grave of a gallant general and the martial music which heralded the funeral procession of a popular statesman, has taken Paris by surprise, for the people had not heard of his illness. EMILE DE GIRARDIN, who cared nothing for art, said of CLÉSINGER's works:—"J'aime les marbres de CLÉSINGER, parce qu'ils remuent." In truth, his statues are instinct with life. His sculpture perhaps lacks elegance of style. It has been defined as *décorative tourmentée*, but certain it is that action and passion are powerfully rendered in all his compositions. His first success was a bust of SCRIBE: a more prosaic head was never immortalised. CLÉSINGER explained his work by the fact that the genius of the prolific dramatist inspired him. He was essentially of a nervous and excitable nature. Popular movements invariably proved an incentive to CLÉSINGER's genius. During the Revolution of 1848 he threw open his vast studio to all artists whose *ateliers* were in a disturbed part of Paris. He cast a gigantic head typifying the Republic, and presented it to the Provisional Government. A few weeks later he executed a colossal figure of *Fraternité*, which was erected in the centre of the Champs de Mars.

In an incredibly brief space of time CLÉSINGER executed M. FOULD's order to replace PRADIER's equestrian statue of the *Duke of Orleans* in the court of the Louvre by one of FRANCIS I. It was theatrical in pose, and condemned by the public; thus the somewhat insane project of raising it on a square pedestal, bearing on each side medallion portraits of FOULD, FRANCIS I., NAPOLEON III., and CLÉSINGER, was not carried out. CLÉSINGER never admitted anything to be impossible, and regretted that his *Francis I.* had not been executed in marble. "But," remarked a friend, "it is so enormous, where would you find a piece of sufficient size?" "At Carrara," he replied. "But there is no direct road by which it could be transported." "One can be made," was his reply; a reply more characteristic of his self-appreciation than of his modesty. M. DUMAS, *fils*, not inaptly inquired whether even uttered by MICHAEL ANGELO, CELLINI, or PUGET, such a reply would be tolerable.

CLÉSINGER's industry partook of the marvellous. It was his habit to rise at dawn, and to walk from his house in Paris to his studio in the Avenue de Madrid (Neuilly). Then he worked without intermission, his meals being laid on a table by his side, till 3 A.M. He would then get on his horse and make the best of his way in the dark along the avenue of the Bois de Boulogne, reaching home about 4 A.M. After two hours' sleep he would return to the *atelier* and resume his chisel. Such was his life, yet he was openly accused of being a *flâneur*, who worked from casts taken from life.

On one occasion his friend M. DUMAS, *fils*, who was then writing "L'Affaire Clémenceau," went to see him at his studio, and struck by the beauty of his model, created the *Andromède* in that work from the inspiration of her peculiar type. Some months later M. DUMAS inquired what had become of the original of his *Andromède*. "Her husband beat her, and spoilt her figure—I could not longer employ her," was CLÉSINGER's reply. The model who sat for his *Femme piquée par un Serpent*, was a celebrated actress of the Odéon Theatre. His marriage with the daughter of GEORGE SAND was an idyll. In that brilliant writer's "Histoire de Matin" she constantly alludes to her little daughter SOLANGE. Madame DUDEVANT received a numerous and somewhat mixed company of writers, artists, and composers in her country place of Rohant in the Berri. The baron, her husband, looked on these as pariahs, and seldom honoured Rohant by his company. When the marriage of his daughter with a stone-cutter, as he designated a sculptor was suggested to him, he indignantly rejected the proposal. The marriage, however, took place, and perhaps the baron's previsions were not groundless, as it speedily ended

in a separation. The mother-in-law and the sculptor fought a duel in the following terms: "Tell CLÉSINGER," said GEORGE SAND to a mutual friend, "if he provoke me further, I shall draw his character in my forthcoming novel, and in a manner so graphic, that he will at once be recognised." "All right," rejoined the sculptor, "I shall exhibit her portrait either on canvas or in marble, and represent her nude; the likeness will be unmistakable." CLÉSINGER, be it remarked, had already executed the fine statue of GEORGE SAND, draped *à l'antique*, which is now in the green-room of the Comédie Française, next to that of ALFRED DE MUSSET, by MAZZARA. Among the works of CLÉSINGER which recur to one's memory as having attracted popularity, are *Lucrèce*, *Artane*, *Charlotte Corday*, *César*, a statue of Prince NAPOLEON, *Cleopatra before César*, now the property of M. DE MARYNHAE; a fine bust of Madame RATTAZZI, *née* BONAPARTE WYSE; a *Phryné holding a Vase*; a bust in bronze of HENRI HOUSSEY; and a *Taureau Romain*.

The funeral of the deceased sculptor took place at the Church of St. Thomas d'Aquin.

PARIS NOTES.

THE Prefect of Police in Paris has issued an important circular to the Commissaires of Police respecting repairs to dwelling-houses, or other buildings that are falling into ruin. The following passages are particularly noteworthy:—"Henceforward, when informed of the perilous state of any building, you will abstain from addressing any summons to the proprietor, but will immediately inform me of the fact in a report, so that my administration may advise the Prefecture of the Seine, which, by the decree of October 10, 1859, is alone competent to decide upon the measures to be taken in such case. It may, however, sometimes happen that the dangerous state of the building must be seen to at once; and, in this event, you will communicate as speedily as possible with the surveyor of the arrondissement, who will then see that the necessary precautions be taken at once. Finally, should you deem it wise, you may, in the interest of public safety, and pending the execution of the repairs or demolition, as the case may be, prohibit all traffic before the threatened buildings, and inform the tenants, by an official notice, of the danger they run in remaining in their apartments." These new regulations effect almost a revolution in the system hitherto prevailing, under which the police have been obliged to proceed by way of summons on the owners, who frequently pay no attention thereto, or at most make some trifling repairs utterly inadequate to the occasion.

Among the first signatures appended to the artists' protestation against the proposed Triennial Exhibition at the Palais de l'Industrie are those of Messrs. Feyen-Perrin, Tony-Robert Fleury, Vuillefroy, Luminais, Lavielle, H. Pille, Guillemet, Düez, Yon, Lalanne, Flameng, E. Vernier, Saint-Pierre, Dubufe, Toudouze, Frappa, Dardoize, Leclair, Bellavoine, Hirsch, Quost, Japy, Gervex, Thomas, Chanet, Debon, Richemont, &c. A copy of the document, the original of which has already been sent to the Ministry of Public Instruction and Fine Arts, has been addressed to all artists who have exhibited at the annual Salons, with a request that they will sign and return it to the secretary of the "Committee of Ninety." It seems impossible that the Government should persist in its scheme in face of the almost universal condemnation it has received at the hands of artists.

The façade of No. 51 Champs-Élysées, the new private hotel of M. Horo, the well-known picture valuer and publisher, who has himself superintended its construction, has been completed, and is a remarkable work. The decorative group on the pediment (*fronton*) of this mansion will arrest the attention of every passer-by. It represents the genius of art, with statues of painting and sculpture—each upwards of 15 feet in height—to the right and left; the design has been splendidly executed by Falguière, the author of the group now crowning the Arc de Triomphe, and was sculptured on the spot out of a solid block of stone weighing no less than 18 tons. Lower down on the façade of the building are two medallions of Michael Angelo and Raphael, also by Falguière. As a general rule houses are built with a view to being sold, let, or inhabited by their owners. Such, however, is not the intention of M. Horo, who has had this little palace erected and fitted up solely for the reception of his collection of paintings and works of art, which are of priceless value. Thus No. 51 Champs-

Elysées may, without the slightest exaggeration or euphonism, be termed the abode of the arts.

The Department of Public Instruction is enthusiastic in sending out exploring expeditions. M. Paul Rey has just received a commission to explore the celebrated Lake Copais in Bœotia—the Cephissus of Homer—now more generally known as Lake Livadia. In summer the greater part of the bed is dry, and used as pasture land for cattle. M. Rey's task will thus be rendered considerably lighter, and is expected to result in the discovery of important archæological and artistic treasures. Another expedition, under the leadership of M. Aubry, mining engineer, and M. Hamon, physician, is to be despatched to Choa and the Gallas country, situate to the south of Abyssinia, with the object of studying its topography, geology, mineralogy, and natural history.

At the last meeting of the Académie des Beaux-Arts, M. Ch. Gounod, vice-president during 1882, succeeded in the ordinary way to the presidency of the body, M. Guillaume being elected to replace him in the vice-chair. M. Delaborde continues his duties as secretary, and the reading committee, whose duty it is to examine the notices and papers that are to be read at the public sittings, is composed of Messrs. Heber, Cavalier, Questel, Henriquet, Rayer, and Em. Perrin, while Messrs. Questel and Bailly are appointed chief administrators for the year.

M. Maspero, when lately passing through Turin, discovered in the museum of that city two Egyptian tablets covered with characters that appear to date from the 20th dynasty. They contain some curious fragments describing a quarrel similar to that of the fabled dispute between the members and the stomach. In this case, however, following the Oriental custom, the story assumes the form of a regular trial before thirty judges, the whole of the argument or speech of the Head being preserved. M. Gaston, Paris, in bringing this important discovery to the notice of the Académie des Inscriptions et Belles Lettres, suggested that Egypt, to which many legends formerly supposed to have had their origin in Hindostan have lately been traced, might also have been the birthplace of the fables.

At its last meeting the Committee charged with the erection of a national monument to Jean-Jacques Rousseau, on the proposal of its chairman—M. Henri Martin, of the Académie Française—decided to organise an exhibition of works of every kind—prints, book illustrations, coloured engravings, portraits, pastels, paintings, bronzes, medals, manuscripts, editions, &c.—relating to the person, life, and work of the great writer. This exhibition is to be held in Paris during the first half of the present year.

The city of Paris proposes to take an active part in the Amsterdam International Exhibition. Not only will it send a complete collection of its own, illustrating the working and organisation of the various municipal services, but arrangements are to be made for the despatch of numerous delegates to the Exhibition at the expense of the city. These are to be representative working men, and will be chosen by the Chambres Syndicales Ouvrières, which correspond to the English Trades Unions. In the majority of cases their expenses alone will be paid, and a credit of 50,000 frs. for this purpose is shortly to be demanded of the Municipal Council.

ARCHÆOLOGY IN GREECE.

THE winter and summer, says a correspondent of the *Times* in Athens, have been made remarkable by the discovery of no such notable work as those which the Germans found at Olympia, but in an archæological point of view it has by no means been devoid of interest. Dr. Schliemann's resumption of his excavations at Hissarlik has failed to develop anything confirmatory of his Ilian hypothesis; the famous stratification of civilisation which was supposed to testify to the extreme antiquity of the city which stood on Hissarlik is shown to be untenable, and further work on the site is stopped.

The Austrians excavating at Gulbaktche, opposite Rhodes, on the mainland, a site the ancient appellation of which is unknown, have made a fortunate discovery of an entire mausoleum, not unlike that at Halicarnassus, and ornamented with reliefs in a very fine style of art—portions resembling strongly the sculptures of the great Pergamean altar. They comprise scenes from the "Odyssey," combats of Amazons, &c., the figures in general being in accordance with the treatment and costume of the florid epoch of Greek art, but many of the figures are in distinctly Asiatic costume. Unfortunately the sculptures are in a fine sandstone, which neither lends itself to finish or preservation as does marble, but the condition of the work is so good as to indicate an early interment.

When reconstructed, as it will be at Vienna, it cannot fail to throw new light on the history of Greek art. The Turkish Government very liberally decided that the series of reliefs ought not to be divided, and so the Austrian Government has secured the entire monument.

In Greece proper, the only work of any importance done is that of the French school at Athens, whose excavations at Delos have now extended over six years. The feeble and unintelligent work done by the Greeks themselves, under the direction of the Archæological Society of Athens, is distinguished more for the narrow and exclusive spirit and anxiety to exclude all other agencies which direct it, than by what has really been done. This society is a veritable dog in the manger, disposing of very little means for archæological work, which it employs mainly in securing sites to prevent excavation except under its own direction, and preparing for operations which would exhaust all the means Greek finances would permit during the next century or two. The clearing out of the theatre at Epidaurus, completed this year, adds next to nothing to our archæological wealth, while the important exploration of Delphi, which the French school had made application for permission to undertake, is blocked by an application of the Archæological Society, made as soon as the French school had made its proposals, and evidently in a purely obstructive spirit, as the French claimed none of the objects found, all going to the Greek museums, gaining only for themselves the honour and the scientific results, which, of course, are common to the whole world. The Greek archæological authorities would not permit even so much honour to leave Greek shores, though themselves without the means to carry on the work.

All the notable archæological year has to show from Greece proper is, nevertheless, the result of the excavations made by the French at Delos. The Delian discoveries now comprise the *fronton* of a temple in a beautiful style of Greek art; eight life-size archaic statues of Artemis, of which one is doubly interesting from its early inscription of dedication by a woman of Naxos, and its close resemblance to the wooden statues which were the first form of sculpture, showing this to be of the very earliest type of archaic work in stone, perhaps the earliest marble statue of Greek *provenance*, and probably of the beginning of the seventh century; a marble statue of Nike, signed on the pedestal by the famous archaic sculptors Archermos and Mikkiades; a splendid female head in the style of Scopas, probably the head of Latona, from her sanctuary in the famous temple; several beautiful portrait busts of the Ptolemies; a colossal statue of Caius Ofellius, signed by two well-known artists of the Greco-Roman period; a mosaic, with the signature of the artist, one of the very few signed Greek mosaics in existence; a colossal statue of Rome signed by the Athenian sculptor Melanos; a colossal statue of Isis; a Hermes, found in the theatre, and most interesting from being covered with curious and witty graphite scratched on three of its sides; a life-sized statue of a warrior by Agasias of Ephesus; many statues by the important sculptors, and inscriptions in great abundance, one of more than five hundred lines, the longest and most interesting Greek inscription ever found, containing the inventory of the sacred treasure of Delos, and revealing the whole system of sacerdotal management and keeping of accounts.

Besides these works, which claim a protection from the Greek authorities and the elements, there are the remains of the Temples of Apollo and Artemis, the porticoes, the agora, the Temple of Isis and the Assyrian Divinities, the early Temple of Helios on Cynthus, and the theatre, whose excavation has this year been completed.

This collection, containing, perhaps, the most valuable examples of archaic Greek art in existence, with unique specimens of the Greco-Roman period, entirely due to the munificence of the French Government, who have expended about 1,200*l.* on these excavations alone, would, one might expect, be transported from the desert island of Delos to the capital, where students of art and even the patriotic pride of the Greeks themselves might profit by them. To those who know Greek ways, their actual destiny is already anticipated. After having been left exposed to the weather, and the sport of the shepherds whose flocks feed at certain seasons of the year on the island, the larger statues still lie there, and those of Caius Ofellius and Rome have been gravely mutilated, while the more important inscriptions have been in part defaced, and the smaller ones in part carried away. The more transportable objects have been carried to Mykonos, the chief and nearest inhabited island of that insular eparchy, and which, therefore, claims jurisdiction over Delos, and are there piled up in two damp basements where a humane carter could not stable his horse, and where are inscriptions, statues, bronzes, terra-cottas, &c., in a condition which forbids access, or study now to an archæologist who has the courage to go to Mykonos to see them, inaccessible to photographers or draughtsmen, and being preyed on by the salt damp, and as useless to the world as they were in the earth of Delos. Yet the Greek Government, which has so centralised administration that a town cannot build a road without the permission of Athens, have not the power or intelligence to rescue this mass of noble work from the barbarous peasantry of Mykonos, because it cannot or dare not deny the rights which a province claims over every object found in its limits.

So the people of Pyrgos, near Olympia, hold the results of the German excavations with the menace to offer armed resistance to any removal of them to Athens, and so they, too, are being gradually consumed by the sea-damp in wretched sheds in a locality where the malaria forbids access half the year, and the utter want of accommodation for travellers makes a journey in the other half an adventure not to be lightly undertaken. In Mykonos there is not even a khan—a stranger must trust to the chance of finding a house opened to him, which rarely happens; and as there is only a weekly communication, *viâ* Syra, with the great world, and this even fails in bad weather, there would be little chance of the collection being seen, even were it provided with a proper museum. It would seem that provincial independence in Greece is only allowed to exist where the most complete centralisation is desirable, while in those respects where liberty of action beyond any immixture of the Central Government would really conduce to progress there is no hope of its obtaining. The reason probably is that neither people nor Government care in the least for the interests of the higher education of which archaeology is a part; and the Government, not to lose its centralised power for political control, permits the provinces to flatter themselves with a petty independence, retaining the historical and artistic objects which form the subjects not of independent study or admiration, but of local vanity. The deputies of Mykonos would vote against the Government that carried the marbles of Delos to Athens, though really they belong no more to Mykonos than to the capital.

The archaeological law (which is a relic of the Bavarian *régime*) forbids excavation even on one's own ground, except with the permission of the Government; it forbids all exportation of any objects of antiquity, and confiscates all that are not declared to the authorities or that are moved from place to place without their permission—provisions of the law in the execution of which little regard is paid even to its letter, while at the same time the most valuable objects are exported clandestinely and commonly, and it continually happens that objects in marble or bronze too large to be moved in secret are broken up by the finders and sold piecemeal, while objects whose chief value is in the knowledge of the location of discovery are sent out of the country to be sold elsewhere, with no clue to that location. The unintelligence and perversity, the total want of common sense in the Greek method of treating the great archaeological interests which inhere in the country surpass anything known in the whole range of their action beside. The law forbidding unconditionally all exportation of antique objects exists only in Egypt besides; but it is curious that a considerable collection of Egyptian antiquities in the Museum of Athens was smuggled out of Alexandria by the Greek officials in violation of the law borrowed from Greece.

PETERBOROUGH CATHEDRAL.

SOME correspondence has been published relating to the proposed reconstruction of the tower of Peterborough Cathedral.

The Rev. Canon Davys says:—"I learn with dismay that the great central tower of Peterborough Cathedral, long known to be dangerous, is to be removed by order of the Dean and Chapter, and I see that an important committee has been formed to assist in the work. But is it necessary to remove a tower of such value? Is it impossible to do at Peterborough what we have so successfully accomplished at St. Albans in the case of a much heavier tower? Sir Gilbert Scott knew how to save both these towers, and Mr. John Scott has told me that he is in possession of his father's arrangements for the preservation of that at Peterborough. I have pressed the importance of this information on the attention of the Chapter, but other counsels have prevailed, with the deplorable result now announced. It is some years since I left 'the city, the place of my father's sepulchre,' and my 'Architectural Guide' to Peterborough, in its latest edition, is, I find, out of print. I have not had time to learn the exact intentions of the architect now responsible for the safety of the noble minster, or the full particulars of the distressing circumstances in which the Dean and Chapter must find themselves placed; but I cannot let the day pass without expressing an ardent hope that not one stone of the Cathedral of my first love may be thrown down which can possibly be left upon another."

Mr. J. Oldrid Scott, in reply, says:—"The central tower of Peterborough Cathedral has been in a critical state for many years; one of the four great piers which carry it—that at the south-east angle—is seriously split, and bulged from the top to bottom, it is only held together by woodwork and numerous iron bands. The upper stage of the tower is also much shattered, and in its eastern face I remember seeing a crack almost wide enough for a man to get through eight or nine years ago. During the time Sir Gilbert Scott was architect to the Cathedral he more than once called the attention of the Dean and Chapter to the dangerous condition of the tower, but it was considered impossible to raise the funds necessary for its restoration, and the work was postponed. It was his wish at that time to deal with this tower as he had with those at Ripon, St. David's, and more recently at St. Albans—namely, to carry the weight of the upper part by powerful shoring of woodwork, and to underbuild the weak leg, either wholly or in part,

leaving the defects in the upper stage to be made good later on. The failure of the tower has, however, I understand, increased quite lately. The condition which I have described was that in which the tower was some eight or nine years since, when I made an examination of it on my father's behalf, and I have no doubt whatever that the course now proposed by Mr. Pearson is the right and only safe one; nor need there be any apprehension that in his hands anything more will be done to interfere with the ancient character of the building than is absolutely necessary for its safety."

The Dean of Peterborough writes:—"No one can sympathise more than I do with Mr. Owen Davys's anxious desire that 'not one stone of the Cathedral of his first love' may be thrown down which can possibly be left upon another. He asks, 'Is it necessary to remove a tower of such value' as the great central tower of Peterborough Cathedral? I think if he had examined that tower as often as I have done within the last few months he would hardly have put the question. But we are acting not on the opinion of any unprofessional person, but on that of one of our leading and most judicious architects. He may rest assured that Mr. Pearson, in whose judgment we have the most perfect confidence, would not recommend the demolition of any existing work unless it were absolutely necessary in order to prevent peril to life and to secure the safety of the building."

Sir Edmund Beckett says:—"No one has yet mentioned what seemed to me the worst symptom of mortal disease in the Peterborough tower when I looked at it with the Dean in 1881—viz., that at some time or other it had been attempted to hold up the south transept front from leaning outwards by strapping it to the tower. Of course, that had not succeeded; the transept has gone on sinking, I suppose from bad foundations, and has torn open the tower worse and worse. Nothing of that kind had happened at St. Albans or anywhere else that I know of. The failure of the piers was much the same. It is not so well known as it should be, when so much is made of rebuilding tower piers and setting up leaning walls, that one of the transepts of Beverley Minster, which overhung 4 feet, or nearly twice as much as the south clerestory of St. Albans, was set up by a Beverley builder early in the last century. I forget the exact date, but the pictures of the machinery used were frequently before my eyes when I was a boy in my grandfather's house there. And hydraulic presses did not exist then, with which Mr. Longmire, the present contractor at St. Albans, did the job of setting up that wall in perfect silence in an hour, filling up the gaps afterwards. There is no doubt that altogether this is a very serious business at Peterborough, and will require every penny of the estimate of 40,000*l.*, and probably a good deal more, unless it is very unlike St. Albans, and, I may add, Lincoln's Inn Chapel—where almost every cut has revealed something still more rotten behind it, both in stone and wood. In both of these churches we had been sitting under Damoclean roofs unconsciously for years. The 'vaulting' of Lincoln's Inn Chapel was composed by Wyatt, the fashionable church 'restorer,' just ninety years ago, of string loaded with plaster and nailed to beams, of which the ends had turned to sponge in the walls. I hope Peterborough may not turn out as bad."

ST. MAGNUS CATHEDRAL, KIRKWALL.

THE trustees of Meason's Mortification for the "repairing and beautifying of the Cathedral of St. Magnus," Kirkwall, recently had under their consideration the propriety of introducing stained glass in the large eastern window, but after bestowing much care and attention on the subject, they resolved, says the *Scotsman*, rather to improve the stonework of some of the windows on the south side of the nave that had got into a dilapidated state. The deed, under which the trustees act expressly, provides for the "opening up of and restoring windows," some of which were shut up, and others had become dilapidated under the decaying hand of time. Five of these windows on the south side of the nave, on which workmen are now engaged, had become so decayed and broken down that only small portions of freestone remained here and there in them, and they had been patched up in a very rude manner with the common blue stone of the county. When the workmen removed this blue stone, they found that the mortar was of the most inferior kind, until they came into contact with the original masonry, when the mortar was of a superior description, and equally as strong as the stone itself. They thus found the removal of the patched-in work an easy matter, and clearly pointed out the original work from that which had been introduced. To these five windows the trustees in the first place directed their attention, and the plans for the restoration were submitted to skilled persons in Edinburgh and elsewhere. From these windows there is a history to be learned, interesting both to the architect and archaeologist. It required no small degree of care and attention to preserve a style that would be in perfect harmony with the spirit of the age in which they were executed, and this has so far been done in a satisfactory manner. The original extent of the cathedral was very small compared with what it is now—consisting, as it then did, of only three bays of the choir, the north and south transepts, and only two or three bays of the nave. At the period at which this part was built (twelfth century) the Anglo-Norman

style prevailed, and accordingly this part of the cathedral partakes of that style, with its massive pillars, semi-circular arches, and bold but low-cut mouldings, with an occasional trowel-pointed ornament. Then we have the transition style from the Norman to the Early English, which latter began to be practised during the thirteenth century. Of this transition style there are some beautiful examples in the arcades of the nave and transepts and the four central arches of the main pillars supporting the tower. Thereafter we have the Early English, with its lighter shafting, pointed arches, bold-cut mouldings, and more delicate foliage on the capitals, bosses, and, generally speaking, new principles of construction brought into use—a very elegant example of which is found in the three bays of the choir and transept chapels. This style began to be practised during the latter part of the thirteenth century, but was not here put into execution until the fifteenth. Of the five windows now in course of restoration, the one farthest east clearly belonged to the Anglo-Norman period, with its double recessed arch, plain chamfered hood, and block-cut capitals, all of which might have received a considerable amount of ornamentation in harmony with the spirit of its style; but it has been thought advisable to keep this part of the restoration as near to the original as possible. The remaining four windows belong to the later period—the Transition and Early English—and have single recessed arches of greater depth, with bold-cut mouldings, moulded hoods, and slightly foliated capitals, all of which are being strictly carried out in as near conformity to the original as possible. It has been suggested to introduce in the window west of the Norman one something of the Transition, such as the zig-zag form of arch, good examples of which are in the window near it, and in the arcades of the nave and transept. This, it is thought, would relieve the dull monotony of four windows of exactly the same description, which is scarcely to be found in any other part of the Cathedral, but would also mark the progress of the building from east to west, and the spirit of the architecture prevalent at the time of execution. It is anticipated that Meason's trustees, if their funds will admit, will afterwards restore the free shafting that have become decayed or fallen out of the other windows, and also execute some needed restoration on the stonework about the doors.

THE DUBLIN MUSEUM OF SCIENCE AND ART.

ON Monday a deputation waited on Earl Spencer, Lord Lieutenant of Ireland, to protest against the adoption of the proposed site for the new Museum.

The Lord Mayor, in introducing the deputation, called attention to a late meeting, when the following resolution was adopted: "That while reiterating the opinion of the former meeting of the citizens that Leinster Lawn should not be interfered with, we are of opinion that the selected plans for the proposed Science and Art Museum are unsuitable, and that revised specifications should be prepared and fresh plans invited under an Irish committee; and we are of opinion, that in order to command the confidence of the Irish public the proposed institution should, as originally contemplated, be under an independent Irish control and management, sister to, but not subordinate to, South Kensington, and that if controlled by South Kensington it will not work out the desired object."

Mr. Ashlin, architect, said he was not prepared to go into details on the question of the site, but the site proposed would only give a building standing on an area of 200 feet each way, and in order to obtain with such a building the required 100,000 square feet it should be three storeys high. That had been proved by all the plans that had been submitted. Again, most of the rooms would be lit only from one side, and that lighting would be insufficient. In an architectural point of view the chief defect would be the inner court—that of Kildare House. The centre would not face any particular street, and there would be no real façade save one looking towards the inner court. The general opinion of all the architects was, that no suitable building would suit the site proposed—they would not be able to obtain the requisite accommodation in a two-storey building. But it appeared to the architects who were at a meeting that he attended that a very good site could be obtained, even on the present area in the possession of the Government, by increasing the area a little towards the north. A building might then be had which would extend 500 feet along Kildare Street, with a centre and main entrance facing Molesworth Street, and which could have two wings, each 230 feet long, extending towards the north and the south, thereby forming a quadrangular building, of which Kildare House would be a side.

Mr. Brooks, M.P., said there must be no misapprehension—the deputation did not recommend any particular site.

Mr. Gray, M.P., stated that when he was Lord Mayor a public meeting was held which pronounced emphatically against the Leinster Lawn site. He attached more importance, however, to the second caution, that the management should be Irish. The Royal Dublin Society had been since then subordinate to South Kensington, and it was notorious that disputes had arisen, and that

the members of the Royal Dublin Society considered themselves aggrieved by the action of the South Kensington officials. The same feeling existed among members of the Royal Irish Academy. The deputation were strongly of opinion that in order to secure public sympathy, in order to be "in touch" with the Irish people, it would be necessary that this establishment should be constituted as originally intended, and be governed by an independent body. It was not suggested that it should be independent of the Government.

The Lord Lieutenant in his reply reviewed the history of the proposed Museum. In conclusion he dealt with the site, saying:—"I am certainly under the impression that the site was discussed by the visitors when I came over in 1880; it may have been informally, and no official minute was taken of it, but I certainly on the 14th of October did discuss with them the question of site. The question of the designs not having been submitted to the visitors was to be answered in this way. One or two of the visitors were appointed, with the president and another member of the Royal Irish Academy, on the committee of selection. Now, I will at once candidly admit that the present site is not the best that could be found, but it is the best, as far as I can see, that is available. My own opinion, and that of the department in London, adopted by me after I came over, was that most decidedly the best site was the Leinster Lawn site. It connected the National Gallery and the National Museum, and the space in front of it, Merriion Square, was so large that I do not think it could be said that it would destroy one of the lungs of the city. I still hold that that site is the best that can be had for the Museum; but I felt that it was necessary to consult the public opinion of Dublin on the subject, and, therefore, plans, simple indication plans, were prepared, merely giving a general idea of what might be done. I rather think they were sent to the Lord Mayor and to the various bodies in the city that were entitled to speak on them. In deference to the opinion then expressed the Treasury agreed to withdraw the proposal to adopt the site. We then had no option but to look for another site. With the visitors another site was discussed. That site was the site facing Molesworth Street, but it was given up after considerable discussion because it was found that it would make the front of Leinster House so extremely dark. The conclusion was arrived at that while it would have a good effect from Molesworth Street it would have a bad effect on the other buildings. There was, no doubt, on the opposite side—they might prolong the Art Schools on the College side of Leinster House. But that involved the purchase of ground—it might not be a very large sum—but at that time it seemed that if the buildings were erected on the other side, the Kildare Place side, they would give all the accommodation required, and would leave the other side for any future extension that might be necessary. I do not know whether I can come, and I should be sorry to come to any definite conclusion to-day; but my own impression is that the difficulties will be so great in finding any other site and getting proper buildings that it will be better for the interests of all concerned in the matter that the present site should be built on, though I quite admit that it is not the best site. The other sites I have already referred to—the site facing Molesworth Street and the Leinster Lawn site. I have heard quite another site suggested. It would be an exceedingly handsome one. I do not wish you to take this as my own suggestion, nor as being one that I favour in any way. I would prefer to be neutral, but I have heard it suggested that a site could be found in Merriion Square. The idea put forward was that some arrangement might be made to throw open Merriion Square as Stephen's Green was thrown open, and that the museum might be built on that side of the square facing Leinster House. I at once see great difficulties in the matter. The people in the square might object, and there might be other difficulties. But there it is as one of the suggestions thrown out. On the whole, I rather think that in the true interests of science and art in the country it would be better to go on and build on the present site. I think it better that this scheme should be carried out, and that those who were looking forward to its completion should not have their hopes deferred any longer, but that the scheme should be carried out as early as possible. I shall most carefully consider the views laid before me, and I am quite certain that Mr. Mundella and the department in London are really most anxious to carry out the work in the way that will best promote the interests of the education of the Irish people.

The House of Commons.—Workmen are at present occupied in fitting up the E Room, latterly used as the Court of Appeal, at Westminster, for the accommodation of one of the Grand Committees. The chairman will be seated at the head of the room, and to his right and left will be three rows of seats for the eighty members constituting the committee. Seats are provided for the Press, and the public will be admitted to the discussions. The room is capable of being enlarged by 20 feet in length and six in breadth. Provision is made for the second Grand Committee by knocking down the partition dividing rooms 10 and 11, which are at the head of the staircase leading to the Committee corridor of the House of Commons. The internal arrangements will be similar to those described above.

NOTES AND COMMENTS.

MR. BRUNLEES, in his presidential address at the Institution of Civil Engineers on Monday, scouted the idea that his profession was too full. So long as capital accumulated in this country, it must, he maintained, be expended in some productive way at home or abroad. Judiciously planned public works are always productive, and the men who find the means will appoint the agents for carrying out the works. Not only are public works, including many new or larger harbours and docks, required at home; not only are new countries of vast extent and enormous resources being gradually laid open to the operations of the engineer, but a greater diversity of employment is offered to him. Mr. BRUNLEES does not suggest that the diversity is to be found in architectural works, although too many engineers are willing to undertake work of the kind, but somehow in connection with the new power of electricity.

WORKS of great magnitude, which may require ten years to complete, are about to be undertaken at the Suez Canal. They comprise rectification of the west bank of the channel of the outer port of Port Said; formation of a new basin at Port Said; widening of the Canal in the passage of the small Bitter Lakes; widening of the Canal between Suez and Kilomètre 152; doubling of the Ismailia station; embankment of Kantara station, and of the station at Kilomètre 133; rectification of the eastern curve of Timsah station; also of the southern curve of the small lakes; also of the northern curve of El Guisr; also of the curve of Toussoum; widening of the Canal off Port Tewfik; deepening of the basin of Port Tewfik; and the annual continuance of the masonry work.

APRIL 29 will be the hundredth anniversary of the birth of DAVID COX, the blacksmith's son, in Birmingham. The town may well be proud of one of England's greatest landscape artists. How is the centenary to be recognised? The worthiest way would be by an exhibition of Cox's glorious water-colours—which, as transcripts of English scenery, can hold their own against TURNER's works. It is understood that the Birmingham Society of Arts are considering the subject, and if they appealed to collectors for the loan of drawings they would be successful. There is sufficient time to bring together a representative collection; but if it is intended merely to fill a small room as a supplement to an ordinary exhibition of the Society, it will be better to entrust the duty to some other hands.

It is rather early to hear of law proceedings in connection with the proposed bridge over the Firth of Forth. The local contractors, MESSRS. ARROL & Co., entered into an agreement with the Town Council of Inverkeithing, by which they were allowed to work the clay in Inverkeithing Bay into bricks. But there has been an alteration in the plans of the bridge and the use of bricks in the construction of the bridge has been abandoned. But with some foresight, the Town Council had made the contractors agree that if the clay was not used as proposed, a sum of 1000*l.* was to be forfeited to the town. The contractors offer instead to pay a rent for some ground which they may require; but the Council are too keen to allow an obligation to be evaded on such easy terms. An offer has been made to accept 500*l.*, or one half the sum originally stipulated, and, should the contractors decline, then the Council will consider the advisability of enforcing their rights in a law court.

In America it is not uncommon to find works of construction which in size surpass European notions. There is nothing in this country that can be compared with the cellar which exists beneath the block of apartment houses in Seventh Avenue, near the Central Park, New York. It measures 405 feet by 20 feet, and the depth of the upper part below the ground varies from 4 feet to 18 feet. It will contain boilers, coals, and a tunnel giving access to the servants' and goods' lifts. The architects, MESSRS. HUBERT & PIERSON, calculate that 45,123 cubic yards of rock have been removed to form the cellar, and, assuming the price to be 2½ dollars a yard, the cost would be 112,800 dollars. The walls to support the upper structure will cost 320,000 dollars so that the total cost of the building to the top of the cellar is 430,000 dollars.

It must be admitted that the gentlemen who formed the deputation that waited on the Lord Lieutenant to express objections against the proposed museum were not distinguished in either science or art. If the members of the Irish Academy and the Dublin Society felt themselves aggrieved, why were they absent? The president of the Academy, Sir SAMUEL FERGUSON, has a better acquaintance with architecture than most amateurs, but he was not among the deputation, and he does not appear to have exercised his eloquence in opposing the proposed museum. The deputation simply represented one party in politics, and it is evident that all the talk about unanimity in Dublin on the subject was absurd. Earl SPENCER, in replying to the deputation at length, gave it some importance; but English architects will be gratified to learn that his Excellency held out no hopes of a new competition. Will the Dublin architects who have been so zealous in parading the defects they fancied were to be seen in the designs of their English brethren be now satisfied, or are they ambitious to appeal to the Throne?

It is understood that Mr. PEARSON, R.A., in his report on Peterborough Cathedral, expressed an opinion that, with regard to the central tower, which is found to be in so dangerous a state, the cause is not to be assigned to the foundations, but rather to a compression in the upper portion of the pillar. He believes that, when the old Norman tower was taken down, the crushed stones only were replaced by new ones, and the displaced stones pushed back into their old places, and held there by the present iron bands that so disfigure the building. There are, therefore, in his opinion, only two plans which can be adopted, one to leave the pillar as it is, in the hope—which he does not indulge—that no further settlement will take place, or to take out the pillar and rebuild it thoroughly; Mr. PEARSON's feeling being strongly in favour of the latter plan. It would appear that the entire cathedral is in such a condition, architecturally, as to require immediate steps being taken for its renovation and partial reconstruction.

COUNTY COURT judges will henceforth, we suppose, recognise the fact that, no matter what quantity of material may have been used in plumbers' work, it is useless if, through some defect, sewer gas be not prevented from entering a house. On Monday, a plumber sued a gentleman at Croydon for 30*l.*, the cost of putting up a lavatory. But there was a counter-claim for 120*l.*, on the ground that, the work being improperly done, sewer air escaped into the house, and caused the illness of six members of the household, and the death of defendant's son. He therefore claimed the doctor's bill and other expenses. The judge struck out the plaintiff's claim, and gave judgment for the defendant. In this case his worship may have been right; but it should be remembered that in many cases there is nothing more difficult to ascertain than how sewer gas did enter a house. It is surprising that in spite of all the experiments undertaken in Croydon it is so easy, as in the case referred to, for dangerous fevers to arise in the town.

THE Executive Council of the Amsterdam Exhibition have been obliged to extend the building, in consequence of the demands for space. The area originally allotted for the British section in the main building having been very early filled, the British Commissioner has now obtained an increase of space which will enable him to accommodate most of the tardy applicants who were shut out. The mechanical, engineering, and general industrial departments being well filled, attention is now being given to the applicants for space in the fine arts and horticultural sections. A jury of artists will be formed to pass works of art. Only those executed since January 1, 1879, are admissible. It is to be regretted that there are no funds available for even the plain and simple decoration of the British sections in the main building, the machinery annexe, and the fine arts gallery. An official application made by the honorary London Committee to the Treasury for even a small sum for this purpose has been refused. Foreign States and the British Colonies exhibiting have made liberal votes for their expenses. The British section will necessarily have a very rude and unsightly appearance alongside of Belgium, Holland, France, &c., which always spend most money in ornamenting their courts at international exhibitions.

ILLUSTRATIONS.

THE CITIES OF ITALY.

M. PAUL BAUDRY has authorised the reproductions published this week of his decorative panels which typify Rome, Florence, Genoa, Naples, and Venice. The originals are in the salon on the ground floor of the hôtel of the Duchesse DE GALLIERA, Rue de Varennes, Paris, forming part of the appartement where the Count DE PARIS resides.

The beauty of the figures is unquestionable, and, as in other works by the artist, children have been introduced who are really childlike in form and action. No modern painter has surpassed M. BAUDRY in the representation of children.

M. BAUDRY has an European reputation from his decorative works in the Opera House, Paris, and by some artists he is placed at the head of living decorative artists in France. But even if his works were less deserving, he would hold a foremost position, his manliness, generosity, and zeal for his friends have secured M. BAUDRY a host of admirers in the most sceptical of capitals.

M. BAUDRY may be said to have made his mark in boyhood, and prior to his arrival in Paris in 1844. There he carried off the first prizes, among others the Prix de Rome in 1850. In Italy he was sought out by M. EDMOND ABOUT, who in his pleasant style gives the following description of the painter—

"My first meeting with him revealed the man to me; solitary, hard-working, pitiless to himself, somewhat shy, but cordial and very pleasant once the ice broken. I looked out for him at Naples, and heard he had gone to Pompeii, and was at the Couronne de Fer. A *gardien* pointed out the *signor pittore*. The sun was blazing. I found a little dark man with brilliant eyes, black hair, and moustache *retroussé*, copying in water-colours one of the frescoes on the wall of a roofless house. All the more interesting was the work, as the original was fading. Probably the young artist heartily swore at me. Nevertheless, he put aside his brushes, and spent the following eight days in doing the honours of Pompeii. A first-rate shot, fond of sport of every kind, BAUDRY will walk any distance; but he is absorbed by art. His energy and untiring application to work are something extraordinary."

The description applies to the more famous M. BAUDRY of to-day. He is still as absorbed in his art, still remains the student, but none the less ready to sacrifice himself for the sake of a friend. For art, too, he has made many sacrifices. He has an ideal and no considerations will allow him to depart from it. Some may think that his works are easily executed, but, with all his dexterity and experience, it may be said that there is no painter whose works represent more laborious thought in their creation.

THE ARCHITECTURAL ASSOCIATION.

THE fourth ordinary meeting of the Association was held on Friday evening, the 5th inst., Mr. R. C. Page, Vice-President, in the chair. The following gentlemen were elected members:—Messrs. E. A. Jollye, H. E. Evans, A. E. Marshall, G. W. Wimperis, L. Frazer, S. Rivett, H. C. Smart, A. F. Collot, J. Watt, W. Ainslie, W. H. Town, A. G. Hall, G. H. Greatbach, G. W. Russell, H. B. Youngman, C. O. King, A. Nicholson, J. H. English, F. Davies, A. Steinthal, E. J. Hall, E. Mackay, H. Riches, W. H. Ferguson, C. J. S. Hall, A. M. Butler, C. Dickinson, A. H. R. Tenison, E. A. Young, S. A. Ell, F. C. Ryde, J. Curwen, and F. E. Faithfull.

Mr. H. W. Pratt, Hon. Librarian, announced some purchases and donations to the library. He mentioned that there were still a number of catalogues, and advised the members to provide themselves with a copy as early as possible.

Mr. W. H. Wood, A.R.I.B.A., then read a paper on

Vaulting.

* He said:—In offering you this essay on vaulting I do so with some diffidence, for I feel that you would consider it presumption in me to address you on so important a subject. The object I have in view, however, will, I trust, plead an excuse for me, my intention being merely to aid the younger members in the study of the subject, and, by attempting a solution of some of the chief difficulties, to facilitate the design of a few ordinary forms of groined vaulting. Vaulting generally is so comprehensive a subject that it would be impossible in the time at my disposal to do more than glance at the different phases of it. As such a treatment would be quite useless, I propose to treat only of a portion of it, viz., Gothic ribbed vaulting, and that in a particular manner. The historical develop-

ment of vaulting has been so exhaustively dissected by the late M. Viollet-le-Duc, and also by the late Sir Gilbert Scott, and more briefly by other writers, that those who desire to become familiar with it cannot do better than study the works of those eminent architects, in addition to the sessional papers of the R.I.B.A. by Professor Willis and Mr. Eagles. I intend, therefore, to omit, except where incidentally necessary, any reference to the historical side of the question; and to confine myself to the practical and scientific solution of some of the problems to be dealt with in modern practice.

Commencing with the simplest Quadripartite, I shall now endeavour to call your attention to the chief points to be attended to in designing vaulting of this form. Having determined the size and form of the ribs, the next question is their curvature and the arrangement of them on the cap. If it be desired that the mouldings shall mitre truly from their springing up to that point at which the ribs become independent arches, three conditions are imperative—It is necessary for the axes of the ribs to radiate at equal angles from a common centre; for the intradoses to touch a circle drawn from that centre; and for all the ribs to be described with the same radius, at least up to the point at which they become free. Another advantage is gained by the radii being equal; the backs of the ribs will then separate at the same height, which, if they did not, would be productive of spandrel pieces of stone. From an examination of the diagrams, it will be evident that in the majority of cases it is impossible for all these conditions to be fulfilled in the arrangement of the wall rib. For making, as is usual, this rib of less width than the others, it would, by causing it to touch this arc, come too forward on the cap. Besides this, when the compartment is oblong, as is more often the case, instead of square, as in this example, the axis of the wall rib cannot be inclined to the diagonal rib at the same angle at which the latter departs from the transverse. This perfect development, then, is generally impossible with regard to the wall rib, and we must arrange it as best we can. The diagonals, however, will almost always form equal angles with the transverse; we can then always insure their perfect development.

I must now direct your attention to the construction of this *tâs-de-charge*, the decorative treatment of which we have just considered. It is, as you are doubtless aware, built in horizontal courses; the joints, therefore, cutting the mouldings obliquely, instead of radiating as the voussoirs of an arch. To understand this method of construction we must ascertain what the result would be if it were attempted to construct it in any other manner. This expression *tâs-de-charge* is the one usually adopted to describe the mass of masonry where the mouldings of the ribs die into one another; in other words, that portion from the cap up to the point at which the ribs become independent arches. Now, if you were to construct this *tâs-de-charge* so as to show the joints radiating to the centres of the various ribs, you would, by reason of the ribs being in different planes, have to form each stone as a sort of *cup*. It is evident that such a method of construction, if it were possible, would be extremely difficult; and, to say nothing of the waste of material, would be very unscientific, as fracture must inevitably ensue on the slightest unequal settlement. I trust that I have made this point sufficiently clear; for the true practical reason of this mode of construction has not, that I am aware of, been pointed-out by any writer on the subject, possibly because it seemed so obvious to them. The majority of writers, have, however, invariably stated that the result of building the *tâs-de-charge* in horizontal courses is to diminish the span, and consequent thrust of the vault. Of this I shall speak later on. As soon as the ribs become independent arches their construction offers no difficulty—they are turned over centreing in the ordinary way.

Having now constructed our ossature it becomes necessary to consider the filling-in. This may be of thin stone or brick, or of both alternating, or of other materials. It may be either flat from rib to rib, or arched; the latter is almost invariably the case now, as we thus avoid a regular boarded centreing, all that is required being a couple of boards cut to the required curve, connected by wooden pins passing through a slot, having a curve concentric with that of the edges; this allows of adjustment to the varying span. This "hand-centre" is supported on the ribs by the metal clips at the end, whilst a ring of filling-in is turned, and then adjusted to the next ring, and so on. The direction that the courses or arch rings shall take is a matter of design, though by setting them out at right angles to a line bisecting the angle formed by a pair of adjacent ribs, the pressure on the ribs is more equalised than by any other arrangement.

When the filling-in is flat, the crown of it will of course be a straight line, and when concave will terminate in a curved soffit. As this curve is the development of the surfaces of the spandrels meeting at the apex, it is necessary to find this in order to cut a special board for its centre. The method of taking ordinates to the curves of the filling-in, and transferring these to a datum line on the section, through which points thus obtained the curve sought can be drawn, was indicated.

In the next example an intermediate rib is introduced on each side of the diagonal. The left-hand side of the diagram shows

the ribs, wall-rib excepted, radiating at equal angles from a common centre, the fillets touching the arc before alluded to, and the radii being equal. These ribs will, therefore, all develop truly; the arrangement, however, is not satisfactory, as a disagreeable hollow is produced between the wall-rib and the intermediate rib next it. The wall rib, moreover, frees itself from the *tête-de-charge* much sooner than the others. Another figure shows an alteration which, though slight, has a material effect on the result. The centre from which the ribs, as before, radiate, is set further back (*i.e.* nearer the wall face), and the wall-rib is brought nearer the axis of the transverse. The outline of the springer is now more pleasing, and the wall-rib becomes free at the same height as the others. When intermediate ribs are introduced it becomes necessary to have wall-ribs to maintain them in a position, the mouldings of them being, as a rule, an approximation to those of the other ribs. (The means by which the approximation could be produced were indicated by diagrams.)

I have not yet spoken of bosses, and as they are numerous in this kind of vaulting this seems to be the place to refer to them. In Quadripartite vaulting bosses are necessary, decoratively, at the crown of the diagonals to avoid the irregular intersection of the mouldings. (A sketch on the blackboard was made to explain the necessity of bosses at the crown of the diagonals). I have used the expression to "avoid the irregular intersection," instead, as is frequently done, of saying "conceal," as that word implies a sham, as if the mouldings did intersect and the ornament of the boss was planted on. As we have seen that the mouldings cannot truly intersect, and that a boss stone is necessary, nothing is more natural and beautiful than that it should be carved, and that the mouldings should lose themselves in the foliage. For the same reason are they necessary in vaulting of the kind we are now considering, at the meeting of intermediate and ridge-ribs, &c. The bosses are worked with the square stump of the ribs on to them to form proper abutment to the ribs.

In this example, the ribs being all struck with the same radius, do not rise to the same height, therefore the ridges do not lie in horizontal planes. The filling-in has been assumed to be arched from rib to rib, hence the double curvature in the ridges. When it is decided to have arched ridges, their curvature being a matter of some importance, it is best to design these first, and work back to find the curve to give to the filling-in. If the ridges, from central boss to either transverse or wall ribs, be either horizontal or of a single arch, the curve of the intermediate ribs must be developed according to the given conditions; it cannot be struck from a single centre. If the ridge is level the filling-in will, of course, be flat; and if of a single curve, will be more or less twisted as it approaches it.

In the Sexpartite vaults there is nothing calling for particular notice. The difficulty before alluded to of the wall rib is increased, as these are generally considered stilted, and the twist in the surface of the filling is consequently greater.

The Lierne vault, in its general arrangement, is similar to the ordinary vault with intermediate ribs. The curves of the liernes have to be found in the same manner as described for intermediate ribs, under certain conditions. The thrust which vaulting exerts, and of the method of calculating it and determining the necessary abutment, were then detailed.

Of the scientific question of the filling-in I must now say a few words. As recently as 1874, during the discussion which ensued at the Royal Institute of British Architects after Mr. Eagles's paper, there seemed to be a doubt in the minds of many regarding it, and instances were given in which either filling or ribs had gone and the ribs or filling remained. It seems to me to act in this way.

(It was here explained on the black board that if the curve of pressures before alluded to were contained within the depth of the groins, the vault would stand without groin ribs, and their introduction, as in some of the earlier examples of mediæval buildings, as mere soffit ribs, would have no influence on the construction, and might fall away without endangering the result. It was also shown by means of the black board, how the filling-in could be made to influence the forces by making it more or less domical.)

In conclusion, I must apologise for the crudeness of much of this paper, and for the roughness of many of the diagrams. Owing to a pressure of other matters, I have not been able to devote sufficient time either to the writing of the paper, or the preparation of sufficient drawings. I had commenced one or two models, but was unable, from want of time, to complete them sufficiently to be of service; I have, therefore, been obliged, though reluctantly, to bring before you many sketches made almost at the last minute.

At the conclusion of the paper a vote of thanks to the author was proposed by Mr. Blashill, seconded by Mr. Trubshawe, and supported by Mr. J. Smith. Mr. Wood having acknowledged the compliment, the proceedings terminated.

Sir Rupert Kettle on Monday distributed the prizes at the Stourbridge School of Art. In addressing the students he said they seemed to have improved glass to the highest point reached in modern times, and Stourbridge glass had the repute of being the very best glass in the world.

ELECTRIC LIGHTING.

A REPORT has been prepared by Mr. Conrad W. Cooke, C.E., Consulting Engineer, on the proposed lighting of Sheffield under the Electric Light Act of 1882. After advising that an experiment should be tried in fourteen of the principal streets, representing over two miles of house frontage, Mr. Cooke enters on a consideration of the arrangements. He says:—

Arc or Incandescence.

Leaving for future consideration the public lighting of the above district, I will confine myself to the illumination of the houses and shops which are directly belonging to the streets of which it is composed; and the first question which presents itself for consideration is whether the illumination shall be effected by arc lights or by incandescence lamps, or by a selected combination of the two. There cannot be a doubt that for large open spaces, for large halls, and for many factories and mills, the illumination by the electric arc is the most convenient, as it is the most economical; but on the other hand it is a system that requires a certain amount of skilled attendance, and the lamps employed require to be fitted with new carbon pencils every day, and not only have the carbons to be supplied, but certain adjustments have occasionally to be made to the lamps. These operations, though simple in themselves to anyone accustomed to them, are such as would prevent my recommending any arc system for indiscriminate private lighting, for which purpose it is impossible for the apparatus within a private house to be too simple, being, as it is, more or less in the hands of domestic servants and other unskilled people.

Lighting by Incandescence.

For the above reasons I am bound to recommend for the general lighting of the district the principle of lighting by incandescence, of which, as the Corporation knows, there are several systems, owned by as many proprietors. I would therefore recommend the laying out of the installation as if nothing but incandescence lights were to be employed; but I would, at the same time, point out that the doing so does not necessarily exclude the employment of arc lights in special cases where they might be more suitable, for it is quite possible—although I do not recommend it—to substitute an arc lamp for a corresponding number of incandescence lamps burning on the same circuit. I should prefer (if there were a demand for arc lights sufficient to justify the outlay) the laying of a separate circuit for them, and actuated by a separate dynamo machine or series of machines, so that the one system would be perfectly independent of the other; but whether this should be done or not can only be determined by local opinion and other local circumstances.

The attendance required with incandescence lights is simply the turning them on or off as required, and the renewal of lamps when destroyed; and as the average life of an incandescence lamp is several thousand hours, and its renewal is as simple an operation as putting a candle into a candlestick, the attention required by consumers is altogether inconsiderable, and does not even include any lighting operation except the turning on of a small tap-like "switch."

For uniform and steady illumination there is nothing (? left) to be desired in incandescence lights. They are perfectly steady, being subject to no fluctuation—which cannot be said of the very best arc lamp at present in the market—although all the arc lamps employed to any considerable extent at the present time are great improvements on those of but a few years ago, and I have no doubt arc lighting will be still further improved by the introduction of regulating lamps still more readily adjusting themselves to the variations of the current transmitted through them, and side by side with these improvements the system of self adjustment of dynamo machines to the work put upon them from time to time will become more and more developed.

Number of Lights required.

In order to arrive at anything like an accurate estimate of the amount of illumination required, that is to say of the number of lights of a given photometric value that will be necessary to be supplied with electricity, I would suggest that the occupiers of premises belonging to the district to be lighted be asked the number of lights they would require (estimating at about eight electric incandescence lamps for every ten gas-burners at present employed), or if that be considered inadvisable, a reliable person might be requested to survey the district with the object of estimating, as nearly as possible, the number of gaslights at present employed in the shops and other buildings attached to the streets mentioned in the schedule, and from an estimate so produced the number of equivalent electric lights might be computed. In the absence of such information, and for the purpose of making a general estimate of what may be considered the requirements of the installation, I have taken an average number of houses throughout the district by considering every 24 feet run on each side of the street as representing one house, and upon this method of computing I take it that there are 550 average houses in the district. In a district consisting of private dwelling-houses, and but few shops, it is fair to estimate that the illumination by incandescence lamps may be effected by allowing an average of ten lamps per

house of an average frontage of 24 feet, upon which calculation there would be required 5,500 lamps. Inasmuch, however, as the district consisting of the streets set forth in the schedule on page 2 of this report is composed, in so large a proportion, of shops likely to require a larger number of lights, I think it would hardly be safe to estimate a smaller number of lights per house than eighteen, which would bring the number of lamps for the district to 10,000. It is not in the least degree probable that every proprietor in the district would adopt the electric system at once, and we may assume that there will be a considerable number who will refuse to adopt it altogether. On the other hand there will be others (and I expect many among the proprietors of important shops) who will require a larger number of lamps than the estimated allowance of eighteen lamps for every 24 feet of frontage, and so the deficiency of some will be made up by the greater demand of others.

Motive Power.

To drive these 10,000 lamps I estimate would require about 1,250 actual horse-power when all working together. This power, estimated at about an eighth of a horse-power per lamp, is, I am aware, greater than that quoted generally by proprietors of electrical incandescence systems, who as a rule state that an average of ten 20-candle lamps can be driven per horse-power, but I do not feel justified in recommending the adoption of a less driving power than one horse-power to every eight lights; but this estimate is an outside one, and should allow a margin for ensuring easy working. I would here point out that, under most of the recognised incandescence systems, the cutting out of lamps is accompanied by a corresponding saving of motive power, and therefore of fuel consumed; so that if at any time 100 lamps be in operation, or 1,000, or 10,000, the power absorbed will bear a proportionate relation to the number of lights in actual operation.

The Cost of Installation.

Mr. Cooke then gives figures by "way of roughly estimating the probable cost of such an installation," and which he summarises in the following table:—

CAPITAL	With compound high pressure engines and Lancashire boilers A	With compound condensing engines and Lancashire boilers B	With compound condensing engines and "Locomotive" boilers C
Electric Apparatus	£10,600 =£1 1s. 2d. per lamp	£10,600 =£1 1s. 2d. per lamp	£10,600 =£1 1s. 2d. per lamp
Motive Power.....	£11,180 =£1 2s. 4d. per lamp	£15,530 =£1 11s. per lamp	£16,700 =£1 1s. 1d. per lamp
Distributing Plant	£8,800 =17s. 9d. per lamp	£8,800 =17s. 9d. per lamp	£8,800 =17s. 9d. per lamp
Land and Buildings	£10,000 =£1 per lamp	£10,000 =£1 per lamp	£10,000 =£1 per lamp
Contingencies, Engineering, &c. ..	£4,066 =8s. 2d. per lamp	£4,501 =9s. per lamp	£4,618 =9s. 3d. per lamp
Total	£44,726 =£4 9s. 5d. per lamp	£49,511 =£4 18s. 11d. per lamp	£50,798 =£5 1s. 7d. per lamp

COST OF WORKING THE INSTALLATION.

Working cost	COST PER LAMP, Using compound non-condensing engines and Lancashire boilers, consuming 2 7/8 lb. of coal (at 7s.) per 1. H.P. per hour.		COST PER LAMP, Using compound condensing engines and Lancashire boilers, consuming 2 3/8 lb. of coal (at 7s.) per 1. H.P. per hour.		COST PER LAMP, Using compound condensing engines & "locomotive" boilers, consuming 2 lb. of coal (at 9s.) per 1. H.P. per hour.

Should there be Uniformity of System and Lamp?

I have in the earlier part of this report recommended the employment of electric lighting by incandescence for the private lighting of the district, for the reasons already stated. It must, however, be a matter for the subsequent consideration of the Corporation whether it will be advisable on their part or not to recommend to consumers the employment of any one system of incandescence lighting or special form of lamp. Of these there are four principal kinds, named respectively after their several inventors—the Swan, the Edison, the Lane-Fox, and the Maxim—

each possessing distinguishing characteristics of its own. It is, however, contrary to the provisions of the Electric Lighting Act of 1882, as it exists at the present date, for the Corporation, as undertakers, to specify or insist upon the consumers employing any particular form of lamp. On the other hand, it is highly desirable, in the interests of the consumers as well as for the success of the undertaking, that no apparatus be employed by consumers that shall either through failure or otherwise bring discredit on the undertaking. To meet this I would propose that the Corporation, without in any way insisting on the employment of any special lamp, should encourage the adoption of a lamp best suited to the installation, either by offering certain advantages in the supply or putting up of such lamps, or by the entering into of an arrangement with certain firms, local or otherwise, for the supply and fitting of those lamps which, in the opinion of the Corporation, are most suitable; such firms agreeing to supply and fit lamps at a price advantageous to the consumer, in consideration for the recommendation and general guarantee of the Corporation. It would in all cases be necessary to make it a condition of supply that no lamp or appliance of any sort be employed by a consumer that has not been previously approved of by the Corporation or their scientific advisers. A provision of this sort made solely in the interests of the general body of consumers could not be in the smallest degree contrary to the spirit of the Electric Lighting Act, or of the rules of the Board of Trade, and would, I believe, meet with general approval. It is, moreover, a condition, applicable and necessary alike to all systems of lighting in which a community of consumers is supplied from a common centre, and therefore is as necessary for gas lighting as for electric illumination.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

ON Monday a meeting of the Scottish Society of Antiquaries was held in the Royal Institution, Edinburgh, Mr. R. W. Cochran-Patrick, M.P., vice-president, in the chair. The first paper was a notice of the ancient "grille," or gate of crossed iron bars, which still swings on its hinges in the doorway of the Tower of Barns, Peebleshire. The tower itself is small, 29 feet by 20 feet, and from 35 feet to 40 feet in height. Its walls are in good preservation, but the interior has been fitted up as a bothy, and a modern roof has effaced anything that may have been in the way of battlement. Above the doorway there is the rudely incised date 1498, which may have been inscribed to indicate the age of the building at a subsequent period, and the initials of William Burnett, surnamed the Howlet, from his skill in conducting nocturnal expeditions, are carved above one of the upper windows. On entering the doorway, which is near the north end of the western face, another doorway is seen a few feet in front, which gives access to the vaulted basement. To the left, in the thickness of the outer wall, is the stone staircase, 2 feet 6 inches wide. The doorway of the outer entrance is slightly recessed, and measures 5 feet 7 inches by 2 feet 11 inches. Its iron gate is an inch less in height, but 3 inches more in width. Exclusive of the outer frame, it is composed of four perpendicular and seven horizontal bars, fully an inch thick, which are interpenetrated, so that the two perpendicular bars nearest the hinges pierce the four upper horizontal bars, and are themselves pierced by the three lower bars, while the two bars farthest from the hinges interpenetrate with the horizontal bars in the reverse of this order, and the ends of all of them penetrate the outer framework, except the second horizontal bar, which stops short of the hinge. Drawings of the gate, with its hinges and chain, were exhibited, and similar "grilles" at Castle Menzies and Barcaldine Castle were referred to, as also the old iron gate of Haddo's Hole at St. Giles' Church, now in the Museum. Dr. Christison concluded his paper by quoting the Act of the Privy Council of 1606, anent turning the iron yettis of the Borders into "plewirmis."

Professor Duns exhibited and described a beautiful silver brooch found in Mull about fifty years ago. He stated that he was indebted to Mr. John Maclean, farmer, Keugharair, Kilmore, Mull, for permission to exhibit the brooch, which differs from all the specimens in the Museum in form and character of ornamentation. It is a flattened ring of silver 3/4 inch wide, the outside rim of which is octagonal, and the inner rim circular, highly ornamented on both sides with engraved designs in panels, enriched with niello. The ornament is both zoomorphic and foliaceous in character, and exhibits also a curious ribbon-like decoration, having the appearance of black letter. Every part of the ring, and both sides of the pin, are covered with ornament, and the whole character of the brooch is so peculiar, that an earnest hope was expressed by Professor Duns, and unanimously approved by the meeting, that Mr. Maclean might see his way to present such an interesting specimen to the National Museum.

In his paper, which was entitled "Notes on North Mull," Professor Duns stated that the district, in which he had spent eight weeks of last autumn, was one of exceeding interest, geologically as well as archæologically, and had not yet been sufficiently explored. He referred to the traces of tribal layers of population

indicated by the names of places and of natural objects, and then passed to the description of the standing stones, stone circles and forts of the district, reserving the subject of the sculptured tombstones and some general notices to a future meeting. Standing stones occur at Ardnacroiss, near the foot of the Torloisk Road, about a mile west of Kilninian Church, and on the slope of Tom Perock. A circle in the low valley near the farmhouse of Ardnacroiss presents peculiar features. It consists of upright flagstones set close to each other, enclosing a heap of smallish stones, about 15 feet in diameter. At Baliscate are three standing stones, two upright and one prostrate, which may be the remains of a circle. At Kilmore there is a group of five, and at Sorn three, which seem also to be remains of circles. After alluding to the occurrence of stone implements in the district, of which he had occasionally heard but failed to trace the specimens, he went on to notice the circular forts of Dunagoil, Dun Eiskeen, Caisteal Cnoc na Treainga, and Dunara, which were minutely described.

Dr. John Alexander Smith described a massive bronze armlet which had been sent for exhibition to the Society by the Right Hon. the Earl of Strathmore. Dr. Smith stated that soon after the publication of his paper on this peculiar variety of bronze armlets, which is only found in Scotland, he received a letter from Canon Greenwell, of Durham, informing him that a specimen was in Lord Strathmore's possession, and on communicating with his lordship it had been courteously sent for the Society's inspection. It was in all respects similar to an armlet which had since the publication of that paper been generously presented to the National Museum by Mr. William Soutter, Kirkcaldy, and both belonging to the rarer variety of these armlets. The example exhibited by Lord Strathmore was found somewhere in the neighbourhood of Glamis, but the precise locality was unknown. They were of great interest as being examples of that peculiar and highly decorative art of the Pagan period, which was afterwards developed to such an extent in the metal-work and stonework of the early Christian period of Scotland. Most of them had been enamelled as well as ornamented in relief, but in both cases the enamels were now gone.

The last paper was a notice by Dr. Anderson of a bronze spear-head found in draining near Duddo Castle, Northumberland, exhibited by Sir John Marjoribanks of Lees, through Mr. David Douglas, the treasurer of the society. The spear-head is remarkable for its size, 17 inches in length, as well as for the fineness of its workmanship. It belongs to a rare variety, with segmental openings in the blade, of which a number of fragments were dredged out of Duddingstone Loch in 1780, but of which there is no good representative specimen in the Museum. The hope was expressed that Sir John Marjoribanks would consider the desirability of placing such a fine example in the National Museum, where it would be useful to science; and Mr. Cochran-Patrick remarked that the acquisition of such representative objects was really a benefit to the country, because it increased the general knowledge of the industrial arts of the past, and enabled us to compare them not unfavourably with those of the present.

THE PROPOSED TYNE AND SOLWAY SHIP CANAL.

A LECTURE was delivered in Newcastle on Saturday evening, by Mr. T. P. Barkas, F.G.S., to the members of the North of England Foremen Engineers and Mechanical Draughtsmen Association, on the proposed "Ocean Highway from the Solway Firth to the Tyne."

Mr. Barkas first sketched the present and prospective canal enterprises in various parts of the world, and said the most important was that from the Tyne to the Solway Firth, thus opening out to uninterrupted communication the great civilisations of the world, and converting Mid-Britain into one of the most important emporiums of trade and commerce the world has ever seen. Looking at the project, he said the dead level at the Solway Firth is a few feet above the sea level at Tynemouth. The greater part of the cutting at Brampton would be through the carboniferous limestone of the permian rocks, and the hardest would be through the basaltic dyke beyond Greenhead, which was very hard but fortunately thin. The cuttings in the permian beyond Brampton would be soft and inexpensive. The geological formations on the route are entire paleozoic, and are the true coal measures from Newcastle to Stocksfield, the carboniferous limestone and yoredale rocks from Corbridge to Haltwhistle, the old permian red from near Greenhead to Brampton, and the new red from Brampton to the Solway. The elevations above the Datur line of highwater at Tynemouth are:—Ryten, tidal; Stocksfield, 46 feet; Riding Mill, 68 feet; Corbridge, 80 feet; Hexham, 115 feet; Haltwhistle, 343 feet; Greenhead, 402 feet; Brampton, 319 feet; Carlisle, 50 feet. The canal would require to be made wide enough and deep enough to float the largest mercantile and war vessels; it ought to be at least 28 feet deep in all parts; the narrowest portion should be 80 feet; and docks, basins, or passing places should be frequent; and that passing places should be not less than 160 feet wide. The canal might either be cut directly through the whole course, 30 feet below the

low water boll of the Eastern and Western Oceans, or it might be made by means of locks. The highest ridges are not, fortunately, of very great extent, and in them are no railway or river interferences, and no expensive bridges; and as to locks, one between Riding Mill and Corbridge, another a little beyond Hexham, a third between Brampton and Carlisle, and a fourth beyond Carlisle would supply all the lifting and lowering power required, and the South Tyne would supply abundant water for the locks. The lock near Hexham and the lock beyond Brampton would convert the intervening portion of the canal into a deep still-water long enclosure, which might be widened out into passing places or locks at any convenient locality. The North Tyne is the only other large stream which would enter the canal above Hexham, and that it would do by an easy gradient for the lock near Corbridge would lift the water to a land surface level near Hexham, and thus utilising a large area of valuable land, which might be appropriated to all kinds of manufacturing purposes. The only important railway difficulty would be a suitable new bridge for the North British near Hexham, and one or two swing bridges for the railways which cross the line of the canal near Hexham. The railway bridges at Wylam and Scotswood would have to be on the swing principle, and there would have to be modifications of the road bridges which cross the valley of the Tyne at Wylam, Riding Mill, Hexham, Haltwhistle, and elsewhere. These were all the practical difficulties, and in these days of steam and dynamite none were insuperable. It was probable that large docks would be required, and that the flat land near Swallwell and the large area of reclaimed land near Ryton would be utilised for this purpose. Having looked at the project commercially, he said it would be folly on his part to estimate the cost of construction; but assuming it to be the same as that of the canal between Liverpool and Manchester—6,000,000*l.*—it was desirable that the project should be carried to a practical issue. He was glad to inform them that a competent engineer was at present engaged in surveying the route, and preparing levels, plans, and estimates; so that in the course of a few months, on the sure data of large practical and surveying experience, they would learn not only the practicability or impracticability of the scheme, but also its cost, and the probability of its being remunerative. He himself was sanguine of the speedy success of that great enterprise.—The President asked which rocks would be the most difficult to get through.—Mr. Barkas replied that the chief rocks on the high cuttings would be the carboniferous limestones; sandstones also were in the same neighbourhood; but the hardest cuttings would be of the basaltic ridge of rocks crossing the line of the canal; but fortunately in the neighbourhood where the canal was likely to pass, this ridge was comparatively narrow—from 25 to 30 feet. Most of the permian rocks were so soft that they would be easily dredged. He had referred to the fact of an engineer being engaged upon the scheme; he himself was not authorised to say what that gentleman had suggested, but one portion of his project was to have locks at intervals, and he was laying down for those who were employing him a series of lines route—alternative routes.

THE PRIVATE BILLS FOR 1883.

THE total number of Bills which Parliament in the ensuing Session is to be asked to sanction is 276, being 44 less than last Session, when the number was 320. The number of Railway Bills (including the Lancashire Plateway, which is a "railway the plates or rails whereof shall be so specially constructed as to admit of the passage thereon of rolling stock capable of travelling on ordinary country roads and the streets of towns, and also of ordinary railway rolling stock"), is 138, being 18 less than the number of last Session, 113 relating to England (including Wales), 15 to Scotland, and 10 to Ireland.

New railways (in addition to important widenings, improvements, and deviations of existing and authorised lines) exceeding in the aggregate 1,770 miles, and additional capital (share and loan) of upwards of 76½ millions, are proposed, as against 1,376 miles and 81½ millions of capital proposed last Session. The majority of the English Bills—seventy-three—with a mileage exceeding 530 miles and capital (share and loan) of upwards of 28½ millions, are promoted by existing companies. Most of the principal companies are seeking powers to construct new lines and to raise additional capital, among which may be mentioned—the Great Eastern, upwards of 61 miles (including a line to Highbee, in Epping Forest, which has been brought before Parliament on previous occasions, and either rejected or withdrawn), and 2,090,000*l.* capital; London and South-Western, 40 miles and 2,039,660*l.*; London and North-Western, 13 miles and 2,133,000*l.*; Midland, 29 miles and 1,800,000*l.*; Great Western, 31 miles and 1,000,000*l.*; Manchester, Sheffield, and Lincolnshire, 18 miles and 1,533,000*l.*; Lancashire and Yorkshire, 15 miles and 2,600,000*l.*—this is the largest increase of capital of any of the existing companies. In addition to what is necessary for the new lines, capital is required by all the companies for increasing their station, siding, and other accommodation and for other purposes. The Brighton Company is apparently the only one of the larger companies that

is not seeking further Parliamentary powers either for new lines or additional capital.

The remaining English Bills—thirty-nine—with a mileage exceeding 778 miles and a share and loan capital of upwards of forty-two millions, are promoted by new companies. Of these, one of the most important is the Lancashire Plateway, with a mileage exceeding 143 miles, which is estimated to cost upwards of 6,900,000*l.*, and a capital (share and loan) of 8,000,000*l.* The line commences at Liverpool, and extends to Warrington, Manchester, Ashton, Stalybridge, Oldham, Rochdale, Bury, Bolton, St. Helen's, Wigan, Chorley, Preston, Blackburn, Church, Accrington, and Burnley. There are several other lines of considerable importance promoted by new companies, including Hull and Lincoln, 57 miles and 2,800,000*l.* capital; London and Eastbourne, 49 miles and 3,000,000*l.*; Bristol and London and South-Western, 40 miles and 1,866,000*l.*; Midland, Birmingham, Wolverhampton, and Milford Junction, 41 miles and 1,666,000*l.*; West of England and South Wales, 45 miles and 1,666,000*l.*; Kent and Essex Junction, 13 miles and 2,800,000*l.*; Birmingham, Walsall, and Cannock Chase, 30 miles and 1,600,000*l.*; Pewsey, Salisbury, and Southampton, 48 miles and 1,600,000*l.*; East and West Yorkshire, 30 miles and 1,600,000*l.*; Barry, 37 miles and a dock at Barry Island, in the Bristol Channel, 2,000,000*l.* capital.

Of new lines in the metropolis, there are only two of any importance, one for which a new company is to be incorporated. The Mid-Metropolitan, which is a line $4\frac{1}{2}$ miles in length, from Lancaster Gate, Uxbridge Road, to the Minories, estimated to cost 2,075,000*l.*, and for which a capital (share and loan) of 3,000,000*l.* is proposed to be raised. This is apparently a revival of the abortive scheme proposed last Session under the same name. The other metropolitan project is promoted by an existing company (the Charing Cross and Waterloo Electric Railway, incorporated by an Act passed last Session), and consists of an extension westward about 110 yards in length to Cockspur Street, and another extension eastward about one and a half miles in length to the Royal Exchange, for which additional capital amounting to 366,000*l.* is required. An unusual feature in connection with these two schemes is the small quantity of land proposed to be taken—for the Mid-Metropolitan, a line of $4\frac{1}{2}$ miles, only $3\frac{1}{2}$ acres, and for the other line of $1\frac{1}{2}$ miles less than an acre, showing that the under surface of the street is to be used very extensively, which may to some extent account for the hostility of the owners and occupiers of property on the lines of route.

Both the Channel Tunnel Companies, whose Bills were before Parliament last Session and not allowed to proceed, have re-introduced their Bills with some modifications.

Of the Scotch Bills, nine with a mileage of about 43½ miles, and share and loan capital exceeding a million, are promoted by existing companies, and six with a mileage of 221 miles, and share and loan capital exceeding 4,250,000*l.*, are promoted by new companies. One of these, the Glasgow and North-Western, proposes to authorise a line from Glasgow to Inverness, 164 miles in length, estimated to cost 1,526,000*l.*, and for which a share and loan capital of 2,800,000*l.* is proposed. Next to the Plateway scheme this is the longest of the new lines proposed. As compared with last session, the length of new lines in Scotland shows an increase of upwards of 150 miles, while the total capital to be raised is less by about a quarter of a million.

Of the ten Irish Bills, with a total mileage of upwards of forty-nine miles, and a share and loan capital approaching a million, seven, with twenty-three miles and a capital of upwards of 250,000*l.*, are promoted by existing companies, and three, with twenty-six miles and upwards of 650,000*l.* capital, are promoted by new companies. This is a substantial increase upon the previous session, when only about fifteen miles and a little over 200,000*l.* of capital was proposed.

The remainder of the Bills are for canals, water, gas, tramways, harbours, and docks undertakings, and various miscellaneous objects, and with a few exceptions are of comparatively little importance. One notable exception is that of the Manchester Ship Canal, the estimated cost of which is 5,634,000*l.*, made up as follows:—Canal works, 4,087,000*l.*; dock works, 1,092,000*l.*; and for the deviations of the existing railways, in order to carry them over or under the canal, 454,000*l.* For the dock works at Manchester, 217 acres of land are proposed to be acquired, and the total capital is 7,500,000*l.*

It may be noted as one of the features of the legislation proposed for the ensuing Session that several noblemen and gentlemen are subscribers to and directors of new projects, thus showing, not by any means for the first time, in the most effective and practical form their desire and willingness to assist the districts in which they are interested to obtain the benefits of additional and improved railway accommodation. Of these may be mentioned the Dukes of Bedford, Buckingham, and Cleveland; Lords Dudley, Anglesea, Shrewsbury, Windsor, Boyne, Wenlock, Wrottesley, Romilly, Cavan, Forester, Acton, Monson, and Pollington; Baron Rothschild, Sir Thomas Brassey, Sir John St. Aubin, Sir Harry Verney, Sir Spencer Maryon Wilson, and Sir George Elliot.

The number of provisional orders for which application has been made to the Board of Trade is 163—namely, tramways, 30; gas, 7; water, 7; gas and water, 2; piers and harbours, 11;

electric lighting, 106; of which 35 relate to London and the suburbs.

A requirement of some importance of the Standing Orders of Parliament has during the present week to be complied with in respect of Bills promoted by new, and some of those promoted by existing companies—viz., the deposit of 5 per cent. on the amount of the estimated cost of the various projects. This sum will probably approach two and a half millions.

THE CONTRACTORS FOR THE NEW LAW COURTS.

THE following circular has been issued by Messrs. Linklater & Co.:—

"7 Walbrook, London, E.C., Jan. 6, 1883.

"Sir,—We regret to inform you that Messrs. Joseph Bull & Sons, of Southampton, and the New Law Courts, have been compelled to suspend payment.

"The completion of the New Law Courts, which, as you are aware, they have recently effected to the satisfaction of the authorities, and in such a manner as to redound largely to their credit as builders, has strained their resources beyond their ability to bear. Their efforts to prevent the forfeiture clauses under the contract coming into operation have affected their general estate to an extent which has resulted in their being unable to meet their engagements, and their position depends entirely on the working out of their very large claim on the Government for extras, of which they are unable to procure a settlement until the Herculean task of completely measuring up the work has been completed.

"Under these circumstances we have to ask your sympathy and forbearance with them in their unfortunate position.

"The books of the firm have been placed in the hands of Messrs. Broads, Paterson & May, of 35 Walbrook, who are preparing a statement of affairs, which will be submitted to the creditors at an early date.

"We are, sir, your obedient servants,

"LINKLATER & CO."

On Monday a petition was presented in the Court of Bankruptcy by Messrs. H. W. Bull, F. Bull, and E. C. Bull, carrying on business under the firm of Joseph Bull & Sons, for the liquidation of their affairs. It is believed that the liabilities amount to about 190,000*l.* in the aggregate, and the assets consist of stock and plant of the value of about 40,000*l.*, apart from heavy claims which the debtors have in reference to their contract for the erection of the New Law Courts. It appears that, besides being the contractors for the New Law Courts, they had undertaken works on the London and South-Western Railway.

Mr. Hackwood, of the firm of Messrs. Linklater & Co., applied, with the concurrence of creditors, for the appointment of Mr. Broad, accountant, as receiver of the estate and manager of the business, and the order was granted.

THE TIMBER TRADE.

ACCORDING to Messrs. Churchill & Sim's Circular, the consumption of wood in the United Kingdom in the year 1882 appears to have been large, for after an importation of more than 6,300,000 loads, as compared with 5,600,000 loads in 1881, stocks generally, so far as it is possible to ascertain, are not heavier than at the commencement of the year. In London for the first nine months the trade was very unsatisfactory. During the winter, owing to an open season, there was a continuous arrival of cargoes. This unseasonable supply, added to the considerable stocks held at the opening of the year, had a most depressing effect on the market, and heavy losses were realised. The importation continued large and the market depressed until the beginning of October, by which time the stock of deals, battens, and boards amounted to over 2,500,000 pieces more than in 1881. This was the turning-point of the market. Had the autumn importation been on the same scale as that of the previous year still another fall in price must inevitably have followed, which, coming on a trade already weakened by a long period of bad business, aggravated by an unusual number of failures in the building trade, would probably have been attended with disastrous results. Fortunately the danger of the position was so manifest that the importation was checked, and to such an extent that during the last quarter of the year only 6,997,000 pieces of deals, battens, and boards arrived, against 12,309,000 in the same period of 1881. A progressive rise in prices—fully accounted for by these figures—set in early in November, and now, with only a stock of 13,595,000 deals, battens, and boards, against 15,649,000 in 1881 and 16,971,000 in 1880, and but nineteen ships to arrive against seventy-two last year, there is good reason to believe the trade will recoup the losses of the past season. The total importation of foreign deals and battens has been 11,804,000 pieces, of which Sweden contributed 7,073,000. The dock deliveries have been 10,843,000 pieces, against 10,991,000 pieces in 1881.

Mahogany.—The trade of the past year has been generally of a

satisfactory character; prices, which were firm at the commencement of the year have shown no great fluctuations, but remained fairly steady until the autumn, when it became evident that the supplies would again be light, and figures then advanced, especially for straight, sound logs from medium to large sizes, which have been and remain very scarce. The dealers and yard-keepers, having no accumulation of stocks, have throughout the year been ready buyers, and the auction sales have therefore been well attended, and as a rule showed considerable animation; prospects are now encouraging for importers. The total number of logs landed is almost identical with the previous year, being 29,435 logs as compared with 29,678 logs; but, the consumption having increased nearly 8 per cent., the stock is now 36 per cent. less than at the commencement of last year, and lower than at any corresponding period since 1872, being only 5,758 logs, or little more than two months' average consumption.

MANCHESTER TECHNICAL SCHOOL.

AT the first meeting of the Council of the Technical School Dr. John Watts was elected chairman, and Mr. Harry Rawson deputy-chairman of the Council. The committees were constituted as follows:—

Building and Furnishing.—Dr. Roscoe, Victoria University; J. Murgatroyd, Manchester; J. Craven, Collyhurst; G. Clay, Gorton; Barton Wright, Manchester.

Museum and Library.—The Mayors of Manchester and Salford; Oliver Heywood, Claremont; C. E. Schwann, Manchester; T. Gair Ashton, Hyde; T. Beckett, Whitefield; J. Murgatroyd, Manchester.

Studies: Fabrics.—J. Slagg, M.P.; G. Lord, Chairman of Chamber of Commerce; Sir Joseph C. Lee, Manchester and Bolton; C. E. Schwann; T. Gair Ashton; W. Hughes, Manchester; S. Armitage, Manchester.

Engineering and Machinery.—Sir Joseph C. Lee, S. Armitage, J. Craven, Barton Wright, F. W. Follows, Manchester; J. Doherty, Manchester; R. Neill, jun., Manchester.

Bleaching, Dyeing, and Printing.—Dr. Roscoe, Edmund Schwabe, Rhodes; John Stanning, Leyland; Henry Worrall, Salford; Seth Wrigley, Manchester.

Art.—Sir J. C. Lee, J. Slagg, M.P.; T. R. Wilkinson, Manchester; T. G. Ashton, G. W. R. Wood, Singleton; J. Murgatroyd.

Organisation of Studies.—Dr. Greenwood, Owens College; J. Slagg, M.P.; Dr. Roscoe, Philip Magnus, City and Guilds of London Institute; F. W. Follows, Manchester; E. H. Fuller, W. Hughes, A. J. Pearce, Bowdon.

Finance.—Oliver Heywood, T. R. Wilkinson, G. H. Shipley, Manchester; W. P. Norris, Manchester; Seth Wrigley, G. W. R. Wood, T. Beckett.

CAIRO.

A LETTER has been published by the Rev. W. J. Loftie in which he says it would be a great satisfaction to know that the English in Egypt are not wholly indifferent to the claims of ancient art. Cairo suffered much during the reign of Ismail Pasha, and during the few months which passed between the accession of the present Khedive and the outbreak of Arabi's mutiny a number of minor works of destruction were carried out, by whose direction we do not know. It is only necessary to mention the so-called "restoration" of the mosque of the Caliph Hakeem, which consisted merely in pulling down and numbering the marble columns that remained standing; the "macadamising" of the Moosky, the removal of the boards overhead, and the construction of a ridiculous and inadequate footpath, which only narrows the roadway without benefiting pedestrians; the removal of the ancient and picturesque buildings which surrounded the Slave market; and the virtual destruction of several old mosques to make room for new buildings in a style which resembles its original in the same degree that the Alhambra in Leicester Square resembled the Alhambra at Granada. M. Arthur Rhoné, has detailed the vicissitudes of Cairo in a recent volume, and has written to his correspondents begging them to call attention to the subject. M. Rhoné describes himself as "attaché à la mission archéologique de France au Caire." No such mission has been sent out from England. The Boolak Museum is, or was lately, managed by a Frenchman and a German; the Khedivial Library, a treasury of Arab art, was in the hands of a German, who had an Italian deputy. In no such post was an Englishman to be found. This is surely the moment at which such apathy on our part should be abandoned. In Egypt, and especially in Cairo, the simple rule has long prevailed that when a building became in any way insecure the first thing to be done was to pull it down. There is great simplicity, no doubt, in this course; but, within seven years only, buildings which a single buttress might have saved have been destroyed, and many of the most beautiful examples of mediæval Arab art, in mosques, bazaars, hospitals, and private houses, have been stripped and despoiled of their carvings, their windows, their tiles, their precious inlays, sometimes out of mere carelessness, sometimes under the name of restoration; and

sometimes, perhaps more often, to sell what Europeans would buy of the ornaments. The pulpit, finely carved, of an ancient mosque is in the South Kensington Museum, besides other relics, and some exquisite glass lamps. Four little ivory tablets, which formerly decorated the hospital built by Kalaoon, and bear his name, are in the British Museum. A friend of Mr. Loftie's bought and brought home all the carvings of a panelled chamber and made them into a smoking-room in his house in Kent. No doubt the Government has much to think of now in settling affairs in Egypt, but the appointment of a few English Commissioners, or even one, to proceed to Cairo and take his place with the French and German savants could not be a matter of any great difficulty, and would certainly lead to satisfactory results in the preservation and perhaps the repair of many interesting but fast perishing remains.

LEGAL.

(Before Mr. C. SHERLOCK, as Arbitrator.)

ANWELL v. THE EVERTON BURIAL BOARD.—PAYMENT FOR WORK.

This action was brought by Mr. Isaac Anwell, contractor, of Liverpool, against the Everton Burial Board to recover the sum of 10,212*l.* 18*s.* 4*d.*, balance claimed to be due on three contracts and extras for laying out a cemetery of about sixty acres at Fazackerley, erecting boundary walls, also three chapels, board-room, and offices, lodges, stables, gateways, and other works. The contracts in the aggregate amounted to 30,338*l.* 15*s.* 6*d.*, making the total claim in the action 46,636*l.* 19*s.*, the cash paid on account being 36,424*l.* 0*s.* 8*d.*

The questions at issue were as follows:—Alleged "tightness" of certificates and consequent closeness in advances, obstruction, want of drawings and definite information, mainly in consequence of alterations and rearrangements in the construction, arrangements, and situations of the buildings, loss of time and profit in consequence of alterations and delay, claim for payment for additional work at rates in excess of the contract rate, to which the contractor considered he was entitled, as there was no negative clause in the contract; differences of opinion as to amounts in claims for day work allowed and disallowed, extending over a period of several years; as to extent and value of the additional works admittedly executed; many incidental items, including interest, &c., and finally, a heavy claim for alleged discrepancies in the quantities supplied to the contractor by the architects to the Board. The quantities stated that they had been taken out by a qualified surveyor; but that the architects would not be responsible for their accuracy. The arbitrator in his award has thrown the liability of the quantities upon the contracts, and not upon the Board by whom they were issued.

By consent the matters in dispute were referred to the sole arbitration of Mr. Cornelius Sherlock, architect, of Liverpool, who, after an inquiry extending over thirteen sittings, awarded that the plaintiff was entitled to the sum of 1,794*l.* 11*s.* 2*d.* in addition to the sum of 620*l.* 2*s.* 2*d.*, and a further marginal sum of 500*l.* paid into court, making a total of 2,914*l.* 13*s.* 4*d.*, and further, that the whole of the costs, charges, and expenses be borne by the defendants. The plaintiff's case was prepared by Mr. F. S. Smith, surveyor, and the defendants were represented by their architects, and assisted by Mr. T. Cooke.

NOTES ON NOVELTIES.

Jennings' Secret Electric Burglar Alarm.—In a recent number of the *Architect* we alluded to a new system of electric communication for buildings, patented by Mr. George Jennings, of Stangate, Lambeth. We now desire to draw attention to his Electric Burglar Alarm for windows, which is based upon similar principles. One of the great advantages presented by this alarm over others worked by electricity is that it is perfectly secret, and no thief can by any possibility know, however closely he may scrutinise a window, that it is connected with an electric apparatus. The mechanism is composed of springs, and fitted in each sash against the front of the box in the frame holding the sash weights, with similar appliances on the latter, all of which are out of sight. On raising the lower, or drawing down the top sash, the springs are brought into contact, and the friction thus engendered induces the electric current (the wires of which are connected with the box portion of the appliance), sets the bell ringing, and causes the pointer on the indicator to be thrown forward, showing the window at which an entrance is being attempted. The bell once set ringing cannot be stopped until the electric current is broken by pushing the stop back in the indicator, and as this would always be fixed either in or close to the bedrooms it would be under the control of the inmates. But to make assurance doubly sure, and presuming that a burglar was enabled to gain access to the wires after the bell had started, with a view to silence it by cutting them, he would be no nearer success, for although he may have cut the wires near the window he would find he had not broken the circuit, which would be immediately transferred to the interior of

the indicator itself, where an uninterrupted one on a smaller scale through the bobbins is kept up, until the bell is stopped. A further advantage this arrangement offers is, that the windows can be opened a short space at top and bottom for ventilation without affecting the electric apparatus. This arrangement can also be applied to every door in the house with the same result, each one being under separate control. In connection with these electric communications Mr. Jennings has introduced a new prescelle, or electric cord holder, which, instead of being actuated by a "push" or button at the bottom, has only to be turned upwards to set the current in motion. This is effected by means of a small body of mercury in a tube concealed in the wood handle, the falling of which causes it to come in contact with two platinum points, which actuate the current. An improved bell, in which the current is never broken between the two poles of the battery, making it more perfect in its action, is a further improvement introduced by the firm, forming the most perfect apparatus for the purposes named.

TOWNS IMPROVEMENT.

Trees in Streets.—A correspondence on the utility, or otherwise, of trees in streets and open spaces has been lately published in the Geneva press. The controversy arose out of a discussion in the International Hygienic Congress, which was held in August, and Dr. Piachaud, a member of the Congress, has since contended, in a letter addressed to the *Journal de Genève*, that trees in streets do more harm than good, that they impede the circulation of air, and that, as for the shade they afford, people who do not like sunshine have only to keep on the shady side of the street. Instead of planting more trees in towns, as some propose, he would rather, in the interests of hygiene, remove all existing trees. To him replies Professor Goret, of the University, who, though an eminent physicist and chemist, disclaims any special knowledge of medicine or hygiene. He treats the matter from an exclusively common sense and scientific point of view. As for people who want shade keeping always to the shady side of a street, he points out that, as streets have generally shops and houses on either side, Dr. Piachaud's advice in this regard, however ingenious, can hardly be regarded as practical. But the functions of trees in streets are not limited to acting as screens for sun-shunning wayfarers; they temper the heat and serve as a protection against dust. The evaporation from their leaves tends to keep the surrounding air cool and moist. One of the best means of refreshing the air of a sick chamber is to place in it plants and branches, and sprinkle them with water. A like effect is produced by trees. Sunlight is necessary to health; but trees, if not too thickly planted, do not intercept sunlight; the perpetual vibration of their leaves and swaying of their branches admit the light every instant, and in sufficient measure, and serve, moreover, to protect the eyes from the noonday glare. So far from trees impeding the circulation of air, they help to purify the air; the evaporation from their leaves determines a current from above, and the fresh air thus brought down helps to drive away the heated and dust-impregnated gases of the streets. Another useful property of foliage is that, while in hot, dry weather it moistens the surrounding atmosphere, thereby rendering it fitter to breathe, this effect, which is due to evaporation, ceases in wet weather. Trees, moreover, act as purifying agents by absorbing carbonic acid and giving out oxygen. But the action of trees on the air is far less important than their action on the soil. Their roots draw up stagnant waters and absorb the organic matters contained in the filth from which the streets of a town are never free, and which, after infiltrating the ground, are a frequent cause of fevers and infection. Trees, in fact, have the same effect on the subsoil of towns as fields have on the contents of their sewers—they act as disinfectants. Taking these facts into consideration, Professor Goret ventures to differ from the conclusions of the Hygienic Congress, and strongly recommends the planting of trees in streets and squares. But they must be planted with judgment. They should be two to three metres apart, and the branches should not be allowed to come in contact with the buildings near which they grow. The sorts best adapted for street planting are those which grow to a considerable height and spread out their branches. The fashion that prevails in some Continental cities of cutting trees down to a uniform size is highly objectionable. The branches of trees so treated become so compacted together as to be impervious to light, and the shade they give, although deep, is too circumscribed to be of much use.

NEW BUILDINGS.

Malvern.—The Beauchamp Hotel, has been considerably enlarged by the alteration and extension of the commercial room and the billiard-room, the addition of stock-room, coffee-room, sitting-rooms, bedrooms, &c., and the reconstruction of the hotel bar or restaurant. The work has been carried out to the designs of Mr. G. C. Haddon, architect, by Mr. Everal, builder, of Malvern, at a cost of over 2,000l.

SANITARY WORKS.

Ramsgate.—A scheme for the ventilation of the sewers has been prepared by Mr. Johnstone, the borough surveyor. The following is a summary of the chief principles and features:—To introduce as much fresh air into the sewers as possible.—1. To dilute the sewer gas. 2. To cool the contents of the sewers—i.e., to prevent decomposition and production of the gas, as well as to dilute it if produced. 3. To carry it off by air currents, or, as it has been termed, by air flushing. Therefore, to have as many ventilators as possible, in as open spaces as possible, as exposed to winds as possible.—To utilise convenient manholes, not only as ventilators, but as flushing tanks also.—General suggestions.—1. That gratings be removed from narrow streets, where not in the centre of cross thoroughfares, and from footpaths. 2. That in the lower parts of the town shafts are generally preferable—as also in narrow streets. 3. That in the more open parts a combination of shafts and gratings is advisable. 4. That in the higher parts, with wider roads, gratings, from 150 feet to 200 feet apart are ordinarily sufficient. 5. That, where practicable, shafts should be taken to the highest part of a gable. 6. That, where manholes are in open wide roads, they may be made available as ventilators. 7. That down rain water-pipes leading directly into the sewer from houses as high as, or higher than, contiguous houses, and all respectively without attic windows, may be used as auxiliary ventilators. 8. That ventilating-pipes from soil-pipes, &c., are to be strongly recommended. 9. That ventilating-pipes from cess-pools are also to be strongly recommended. 10. That, whether there are ventilating pipes from soil pipes, or soil pipes themselves open at the top, they should be carried as high as practicable. 11. That where tall chimney shafts are available, ventilating pipes be led into them. 12. That, where practicable, ventilating pipes should be from four to 6 inches in diameter. 13. That, where practicable, gratings should be placed in the centre of crossing of two roads or streets, at or near a right angle. The estimated total cost is 465l. There are to be thirty-five pipe ventilators, seventy street ventilators, and six ventilators for the Military Road, in all 111 ventilators. The scheme was generally approved, but the further consideration of it was adjourned.

SCHOOL BUILDINGS.

Birkenhead.—The foundation-stone of new school buildings, Borough Road, in connection with Christ Church, Claughton, has been laid. The buildings are in three departments, to accommodate 976 children. The general plan resembles the letter "E," the infant school forming the central block separating the boys' and girls' schoolrooms. There will be three principal rooms and nine class-rooms, the latter under full control from the large rooms. The design is Gothic in character, with double and triple lancet windows and cinq foils, the long line of roofs being broken by small gables. The contract for carrying out the work has been taken by Messrs. Bleakley & Son, builders, Birkenhead. Mr. A. Bleakley, junr., is the architect.

Newcastle-on-Tyne.—New Board Schools, Scotswood Road, have been opened, in which accommodation is provided for about 1,000 children. The building is two storeys in height. The infants are to be accommodated on the ground floor, and provision is made for 364 in a large room with three adjacent class-rooms. On the upper floor there is a room, 80 feet by 35 and 20 feet high, to be used as a mixed school, and six large class-rooms, with teachers' rooms, cooking class-room, &c., accommodating in all 646 boys and girls. The buildings are of stone with red-tiled roofs. Mr. Robert J. Johnson is the architect; Mr. Glaister clerk of works; and Mr. Humphrey Atkinson, general contractor.

Ipswich.—A new Board School, erected on the Shirehall site, has lately been opened. The school is built of red brick, with Ancaster stone dressings, the roof being covered with Ashton & Green's permanent green slates, the style adopted being a simple form of Gothic. Accommodation is provided for a total of 786 children—boys, girls, and infants. Mr. Brightwen Binyon, F.R.I.B.A., is the architect, and Messrs. G. Grimwood & Son, of Sudbury, are the builders. The cost has been about 6,457l.

Sheffield.—The twenty-third school erected by the Sheffield School Board has lately been opened. The building is designed on the central-hall system—the first of the kind in Sheffield—by Mr. C. J. Innocent, architect to the Board. The heating of the entire schools is by steam on Leeds' patent system, fixed by Messrs. Longden & Co., of Sheffield. The ventilation is by Boyle's system. The walls are of Walkley wall-stone, with Grenoside ashlar dressings, the roofs being covered with black Westmoreland slates. The contractors for the works are Messrs. Chadwick & Co., of Rotherham. The contract amount is 8,800l., including all work in play-grounds, caretaker's house, warming apparatus, &c., and the total accommodation is for 1,024 scholars. Mr. John Laidler has been clerk of works.

Graingerstown, Cardiff.—The following report was read at the last meeting of the Cardiff School Board:—"It appearing that the

nature of the ground rendered the foundation to be made much deeper than was provided for, the architect was requested to investigate and report to the chairman of the committee. The architect reported: I have had trial-holes sunk on the east and west and one in the centre of the site, and I have ascertained the depth of the gravel to be in each case 27 feet 10 inches, 23 feet 2 inches, and 22 feet respectively, making an average depth of 24 feet 4 inches to the gravel over the area of the site. I have also found that the depth of the upper strata of clay is 7 feet deep in the west, 5 feet 3 inches in the centre, and 6 feet in the east trial-hole. The average depth of hard clay being 6 feet 2 inches, it would not be wise to build upon less than 4 feet of concrete, and adopting this plan and keeping the surface of the concrete within 9 inches of the finished playground level, there would then remain but an average depth of 2 feet 8 inches of hard clay under the concrete line—not sufficient, I think, to resist the weight of a two-storeyed building. I can now suggest two schemes for a safe foundation for your consideration. I propose in scheme No. 2 to construct piers of concrete upon the gravel bed, under the two-storeyed buildings; and for a foundation to the infants' school I have kept the original plan, and added 2 feet to the depth of the concrete. The concrete will, therefore, be 5 feet 6 inches wide by 4 feet deep under all the main walls of this department. I can recommend this scheme with some confidence, because the hard clay is 7 feet in thickness on that part of the soil upon which it is proposed to erect the infants' school. I estimate the cost of this plan to be 641*l.* 2*s.* 4*d.* In passing to scheme No. 1, I may mention that if I could have placed the concrete for the infant school walls at a greater depth from the surface of the ground, and thereby making the clay upon which it rested less liable to the action of the temperature, I should have strongly recommended this scheme as being without risk, but as I cannot do this, I have suggested another plan. In scheme No. 1 I propose to erect the whole of the school buildings upon piers carried down to the gravel bed, and from what I can gather from carefully examining the buildings in the vicinity of the site, I should advise the Board to adopt it as being the best, and avoiding all risk of settlement. The cost of this scheme I estimate at 95*l.* 15*s.* 6*d.* I enclose quantities of each scheme." After reading and considering the report, it was resolved to recommend the Board to adopt Scheme No. 1. The architect was requested to obtain a tender from the contractor for production at the ordinary meeting. The tender of Mr. Davies for 960*l.* was accepted by the Board, and application will be made to the department to sanction an increase in the loan in consequence of this increase in the cost.

CHURCH BUILDING AND RESTORATION.

King's Heath.—The church at King's Heath has been reopened after works of restoration and enlargement. The church has been extended by the addition of a north aisle, organ chamber, and vestries; 127 extra sittings are thus provided. It is proposed to erect a south chancel aisle when funds will permit. The work of enlargement was carried out from plans prepared by Mr. J. A. Chatwin, of Birmingham; Mr. Parton, of King's Heath, was the builder. The carving of the capitals was executed by Mr. Bridgeman, of Lichfield; and Messrs. Hassall & Singleton provided the heating apparatus.

Arbroath.—Erskine Church is to be reopened to-day (Saturday), after undergoing works of renovation and improvement, carried out from the designs of Messrs. James MacLaren & Son, architects, Dundee. The exterior of the church has not required such extensive handling as the interior. The only portion dealt with is the front, a pleasing specimen of thirteenth century Gothic. It is divided into three bays, of which the centre, advancing a little, contains a four-light traceried window, the side bays containing the doorways, with lancet above lighting the gallery stairs. The contractors, all of whom have executed their work in a highly creditable manner, were:—For mason work, Mr. William Scott; joiner work, Mr. David Duthie; slater, Mr. William Brand; plaster, Messrs. Middleton & Donald; painter, Mr. Alexander Mathewson; glazier, Mr. R. Farquharson—all of Arbroath; the plumber work by Mr. David Brown, Dundee. The stained glass was executed by Mr. Holloway, of Liverpool; and the tile work by Messrs. Mackie & Miller, Glasgow. Mr. James Scott was clerk of works.

ART WORKMANSHIP.

Chancel Screen and Pulpit.—A chancel screen and pulpit, gifts to Belgrave Church, have been lately put up. The chancel screen is made entirely of oak, designed in the late Decorated style, resembling the ancient screens of Leicestershire, and consisting of five compartments, the central one being wider than the others, and without doors. The side compartments are panelled below the middle rail, and ornamented with cusplings and foliated spandrels. The large pierced tracery heads are particularly bold, and have spandrels carved in great variety. In the cornice a con-

vex band of vine leaves and grapes is introduced on the western side, while the eastern or chancel side has a slight cove, each being finished by a pierced cresting continued in an unbroken line the entire length of the screen. Over the centre of the screen rises a moulded and carved cross, about 4 feet 6 inches high, with foliated crockets and terminations, and supported at its base by cusped and traceried buttresses. The new pulpit is of carved oak on a base of stone, designed in the same style as the screen, and in harmony with the few existing fragments of the old chancel fittings. Messrs. Cooper & Vann, Southampton Street, worked the stone base to the pulpit, and the woodwork of both screen and pulpit has been carried out by Mr. W. H. Noble, of Nichols Street, Leicester, from designs by Mr. Edward Turner, of Bowling Green Street, Leicester, architect.

GENERAL.

Mr. W. H. Smith has promised 500*l.* towards the erection of a new parish church for the parish of Portsea.

Sir F. Leighton, P.R.A., was the proposer (on the nomination-paper) of Sir Charles Dilke to be member for Chelsea at the election on Monday.

Mr. Honeyman, F.R.I.B.A., has received a commission from the Helensburgh Police Commissioners to prepare plans for a new Town Hall.

Mr. Madox Brown's Cartoons, depicting the legend of St. Edith, have been presented to the Manchester Art Gallery by Mr. Rowley, Town Councillor.

The Marquis of Bute has informed the Commissioners of Cumnock that he hopes to be able to offer a site for the proposed Town Hall, and will subscribe 500*l.* towards the cost of its erection.

Mr. John Chudleigh, of Newton Abbot, has obtained the first premium in the competition for the new market at Bideford. The second prize was awarded to Mr. W. R. Bryden, of Bideford, and the third to Mr. J. Watson, of Torquay.

Dr. Schliemann has been granted permission from the Hellenic Government to excavate on the north-west of Athens, near the old Academy, where those who fell in war were buried, and where the grave of Pericles is supposed to be. After exhausting this region, he proposed to explore the island of Crete.

The Lord Chamberlain has, on the representation of the Metropolitan Board of Works, granted a provisional licence to the Criterion Theatre during the consideration of the plans for further improvements.

The Clothworkers' Company have voted 500 guineas in aid of the fund for extending the building of Girton College, this grant being in addition to 500 guineas formerly made for the building, and 25*l.* per annum for three exhibitions.

The Statue to the late Prince Louis Napoleon at Woolwich will be unveiled to-day (Saturday).

The Sise Collection in Amsterdam is, it is said, about to be purchased by Baron Edmund de Rothschild.

A Clock is to be placed in the tower of Salisbury Cathedral, as a memorial of the officers and men of the Wiltshire Regiment who fell in the Afghanistan campaign.

A New Theatre is to be erected in Corporation Street, Birmingham, which will hold 4,000 people, and will cost 20,000*l.* It is to be completed in September or October next.

Messrs. Lamb & Armstrong, of Newcastle-on-Tyne, have prepared plans for the erection of a Working Men's Club and Institute at Newburn. A local gentleman has promised 1,000 guineas towards the erection.

The Arcade erected in New Street, Birmingham, at a cost of 70,000*l.*, was opened for public inspection on Wednesday evening. Mr. J. Garlick, of Saltley, was the builder, and Mr. W. H. Ward, of Birmingham, the architect.

A Company has been formed, under the title of "The Art Electrotypes Company," for the production of metallic copies of all kinds of art subjects, of the higher description of stove and door panels, plaques, shields, medallions, &c., including *repoussé*, hammered, finely chased, and engraved work, besides work in connection with printing and engraving. Being under able management, the company can hardly fail of success.

The State Apartments at Hampton Court Palace are again open to the general public, but there are signs of the recent fire still remaining. The tapestry has been dried, but not yet re-hung; and it looks none the worse for the saturation it received during the fire. In George II.'s closet, George II.'s private chamber, the King's Closet, and several other rooms, the oak panelling has been removed to allow the walls to dry. The painted ceiling in the Queen's bedroom is drying satisfactorily, and the fears at first expressed as to the damage which this fine work of art would sustain have happily proved groundless.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JANUARY 13, 1883.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*** Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—
"Contract Supplement to THE ARCHITECT."*

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

APPOINTMENTS VACANT.

GLAMORGAN.—Jan. 31.—Applications are required for the Appointment of Three District Road Surveyors. Salary £150 per annum. Mr. Richard Evan Spencer, Clerk to the County Roads Board, Cardiff.

STAINES.—Jan. 16.—Applications are invited for the Post of Surveyor to the Local Board. Mr. J. A. Engall, Clerk to the Local Board, Staines.

SWINTON.—Jan. 13.—Applications are invited for the Appointment of Surveyor, by the Urban Sanitary Authority of Swinton and Pendlebury. Mr. W. Joy Hewetson, Clerk to the Board, Swinton.

WALSALL.—Jan. 27.—Applications are required for the Appointment of Borough Surveyor. Mr. Samuel Wilkinson, Town Clerk, Walsall.

COMPETITIONS OPEN.

BRIGHTON.—Feb. 1.—Designs are invited for the Madeira Road Improvement. Premiums of 200*l.*, 100*l.*, and 50*l.* Mr. F. J. Tillstone, Town Clerk, Brighton.

NOTTINGHAM.—March 15.—Plans, Designs, and Estimates are invited by the Corporation for the Erection of Municipal Offices. Premiums to the extent of 600*l.* offered. Mr. S. G. Johnson, Town Clerk, Municipal Offices, Nottingham.

WEST HARTLEPOOL.—Feb. 1.—Plans are invited of a Church for St. Paul's New District, Stranton. Mr. W. D. Ramsey, 1 Bell Street, West Hartlepool.

CONTRACTS OPEN.

ABERDEEN.—Jan. 13.—For Additions, Alterations, and Repairs to Mance and Church of Newhills. Messrs. Wm. Henderson & Son, Architects, 124 Union Street, Aberdeen.

ACCRINGTON.—Jan. 22.—For Construction of Intercepting Sewer, Storm Overflows, &c. Mr. S. Knowles, Borough Surveyor, Town Hall, Accrington.

ALSAGER.—Jan. 17.—For Constructing Reservoir at the Hill, to contain 90,000 gallons of Water, and for Laying about 3½ miles of Water Mains, and Erection of a Double-Ram Steam Pump, with Boiler, &c. Mr. Robert Rigby, Audley.

BARLINNIE, GLASGOW.—Jan. 29.—For Supplying and Fixing Two Steam Boilers, Supply Pipes, Six Steam Cooking Boilers, &c. Plans and Specifications at the Prison Commissioners' Office, 130 George Street, Edinburgh.

BARROW-IN-FURNESS.—Jan. 24.—For Construction of Brick Sewer, &c. (Contract No. 2). The Borough Engineer, Barrow-in-Furness.

BELFAST.—Jan. 16.—For the Supply of Earthenware Sewer Pipes. Mr. J. J. Montgomery, Town Hall, Belfast.

BICKINGTON.—Jan. 13.—For Proposed Restoration of Parish Church of Bickington, near Newton Abbot. Mr. R. Medley Fulford, Architect, The Close, Exeter.

BIRKENHEAD.—Jan. 18.—For Alterations to the Birkenhead Post Office. Drawings, &c., with the Postmaster, Birkenhead.

BLACKBURN.—Jan. 22.—For Masonry and Ironwork for Reconstruction of Bridge over Darwen Street. The Engineer's Office, Hunt's Bank, Manchester.

BLACKMINSTER.—Jan. 16.—For Construction of Passenger Station at Blackminster, near Evesham. Plans, &c., at the Engineer's Office, Paddington.

BLACKWELL.—Jan. 15.—For Building Cottages, Fence Walls, &c. Mr. J. P. Pritchett, Architect, 24 High Row, Farington.

BLAXTON.—Jan. 18.—For Supplying and Constructing Pipes and Pipe Sewers (5,000 yards). Mr. T. C. Nicholson, Engineer, 24 Grainger Street West, Newcastle-on-Tyne.

BROMSGROVE.—Feb. 6.—For Construction of Sewers, &c. Mr. S. G. Purchase, C.E., Worcester.

BROSELEY.—Jan. 16.—For Construction of Cemetery, Erection of Chapel, with Walls, Gates, &c. Mr. Henry Haddon, Architect, Rockliffe, Malvern.

CARLISLE.—Jan. 24.—For Building Shops, &c., English Street. Mr. J. Marchie, Architect, 25- Lowther Street, Carlisle.

CHELTENHAM.—Feb. 1.—For Building Central Gas Offices with Residence at Junction of North and Albion Streets. Mr. John G. Dann, Architect, 44 Waterloo Street, Birmingham.

CHORLEY.—Jan. 20.—For Erection of Shed for the Corporation. The Borough Surveyor, Chorley.

DARLINGTON.—Jan. 17.—For Alterations to Post Office Drawings, &c., with the Postmaster, Darlington.

DONCASTER.—Jan. 26.—For Construction of Sewage Reservoir, Engine-shed, Pipe Sewers, Brick Culvert, &c.; Supplying and Laying Gas Pipe (850 yards). Mr. Alfred Wright, Surveyor to the Rural Sanitary Authority, Union Offices, High Street, Doncaster.

DUBLIN.—Jan. 17.—For Construction, Delivery, and Erection of Fog Bell and Machinery, North Wall Lighthouse. Mr. Bindon B. Stoney, North Wall, Dublin.

DUBLIN.—Jan. 27.—For Alterations and Additions to General Post Office. Plans, &c., at the Architect's Department, Public Works Office, Dublin.

DUBLIN.—Jan. 27.—For Building Record room at No. 24 Merrion Street. Plans, &c., at the Architect's Department, Public Works Office, Dublin.

DUNSHAUGHLIN.—Feb. 1.—For Building Dispensary and Dispensary Residence. Mr. William H. Byrne, Architect, 52 Dame Street, Dublin.

EARLSHEATON.—Jan. 19.—For Re-erection of Sykeing Mill. Messrs. John Kirk & Sons, Architects, Dewsbury.

EUSTON.—Jan. 17.—For Cast Iron Girders. Drawings, &c., at the Engineer's office, Crewe Station.

GOLCAR.—Jan. 25.—For Building New Connection Chapel, Boundary Walls, and Out Offices. Messrs. John Kirk & Sons, Architects, Huddersfield and Dewsbury.

GWARLODYGARTH.—Jan. 15.—For Erection of School Buildings. Mr. J. J. Evans, Architect, Maesyfidd, Treorky, near Pontypridd.

GREENOCK.—Jan. 18.—For Construction of a Kinipple's Wrought-iron Travelling and Folding or Lowering Bridge, &c. Mr. W. R. Kinipple, C.E., 17 West Blackhall Street, Greenock.

GRIMSBY.—Jan. 19.—For Alterations at the Post Office. Drawings, Specification, &c., with the Postmaster Grimsby.

HACKNEY.—For Supply of Twenty-five Hydrants. Mr. James Lovegrove, Chief Surveyor, Town Hall, Hackney, E.

HECKMONDWICK.—Jan. 17.—For Building a Methodist Free Church. Mr. Arthur A. Stott, Architect, Heckmondwike.

HORSFORTH.—Jan. 29.—For Construction of Glazed Earthenware Pipe Sewers, 2,117 yards, with Manholes Ventilators, and Flushing Apparatus. Mr. Wm. B. Woodhead, C.E., 65 Market Street, Bradford.

HUDDERSFIELD.—Jan. 27.—For Erection of various Buildings adjoining Technical School. Mr. Edward Hughes, Lord Street, Huddersfield.

HULL.—Jan. 24.—For Construction of Foundations, Buildings, Sewers, and other Works for a Pumping Station for Drainage of West District of the Borough. Plans, &c., at the Borough Engineer's Office, Town Hall, Hull.

INVERURIE.—Jan. 19.—For Works in Extension of Churchyard, enclosing Walls, &c. Messrs. Jenkins & Marr, Architects, 16 Bridge Street, Aberdeen.

KIDDERMINSTER.—Jan. 25.—For Building School in Mill Lane. Mr. J. T. Meredith, Architect, Bank Buildings, Kidderminster.

KILMACOW.—Jan. 31.—For Adding Chancel and Vestry to Church and Sundry Internal Alterations. Mr. J. F. Fuller, Architect, Brunswick Chambers, Dublin.

KINTORE.—Jan. 16.—For Building Works. Mr. James Cormack, Castle Hill, Kintore.

LONDON.—Jan. 30.—For Construction of Wrought-iron Travelling Caisson at Esquimalt, British Columbia, with Keels, Folding or Lowering Bridge, &c. Messrs. Kinipple & Morris, C.E., 2 Westminster Chambers, London, and Greenock, N.B.

LYNX.—Jan. 31.—For Sewering portion of the Local Board District, Construction of light Iron Bridge at Statham Pool, and other Works. Messrs. Wilson & Mulliner, Albert Square, Manchester.

MADRON.—Feb. 1.—For Building Parsonage House, Offices, Stabling, and Coach House. Messrs. Perkins & Caldwell, Victoria Square, Penzance.

MIDLAND RAILWAY.—Jan. 16.—For Making Road, near Manningham Station. Plans, &c., at the Engineer's Office, Wellington Station, Leeds.

The Architect.

THE FAILURE OF THE LAW COURTS CONTRACT.

IN every contract for the supply of goods for money there is necessarily a risk of loss, and it is easy to understand that the greater the complexity of the transaction the greater the risk. When the speculative element introduces itself into the calculation of price the case can never be expected to be otherwise ; but there are certain classes of contracts to all appearance not speculative, or not so to any material extent, in which nevertheless there come to be involved practical hazards much more grave than reasonable, and the system of building contracts, especially as at present practised in England, seems to supply instances of this with a facility which occasionally cannot but provoke the reflection of the public. It is not that great fortunes are made unexpectedly, while great failures occur to balance them. When a fortune is made in the building trade, it is by the slow and steady accumulation of surplus profits ; whereas failure, when it comes, appears to have been brought about by literally throwing money away. In other words, the alternative of profit and loss in a building contract is not a small gain against a small sacrifice, but a small gain against possibly a ruinous sacrifice ; and it need scarcely be said that this is not a healthy condition of commerce. The reason is that the extreme refinement of our competition tender system, in so far as it may be called for the sake of the argument a lottery, throws the chances against the builder. The misfortune which at the end of their gigantic undertaking the contractors for the new Law Courts are obliged to acknowledge will necessarily force this upon the notice of the public.

To appreciate the truth of what we have said, it is only necessary to glance at the lists of building tenders which are published in this journal every week. From five to ten amounts appear in the most ordinary cases in a declining list extending from the highest, which may be presumed to be at any rate an honest proposal, or it would scarcely be so openly avowed, down and down by more or less regular degrees to the lowest, which is accepted. In some instances there are fifteen, twenty, even thirty of such tenders ; and in these longest lists there often appears the suggestive phenomenon of the lowest tender being, after all, not accepted : that is to say, the employers are satisfied that it would be actually unwise for themselves to take the risk of contracting at a price so palpably inadequate.

No doubt there are many architects who explain the case to their clients in so frank a manner as to induce them to consider, not the one question only how to obtain the lowest offer that can possibly be obtained, but the more generous and in reality more safe alternative, how to get an offer which shall represent a fair and proper price. But it is equally certain that many other architects do not think it to be their business, as they plainly say, to do anything else than force competition to the utmost extremity ; and it must also be confessed that the pressure of price which is exerted upon architects themselves, by their own anxiety to meet unreasonable demands, far too frequently compels something like a little sharp practice, which falls doubly hard upon the unfortunate builders. One of the simplest forms of this mode of procedure is that in which the architect "naturally" leans towards the cheapest view beforehand of those features of ornament and other detail which he has to develop afterwards, and equally "naturally" has a little preference for developing such features liberally when the time comes.

The practice of specification-writing and quantity-taking tends also to increase this evil. Some cases are better and some worse, but it may be said in a general way that the customary language of specifications is much more vague than it ought to be, and that the incertitude lies all in the direction of increasing rather than diminishing cost, if the architect or any other adjudicator were disposed so to construe it. In illustration of this we need only refer to the constant employment of

the word "best" with reference to both material and workmanship, and to the elaborate reduplication of exacting phraseology in the general clauses, when it is quite clearly if tacitly understood that no intention ever existed of paying for the really best goods in the market, or of interpreting in any serious sense the strictness of the comprehensive conditions. As regards the quantity-surveyor, on the other hand, the further the prevailing policy is followed out, whereby the architect relieves himself from all responsibility, even in honour, towards the builder, whilst at the same time retaining the right, and indeed duty, of carefully impressing upon the surveyor the propriety of keeping the cost within certain limits of estimate, the more helpless is the contractor when he discovers too late that he has read some of the descriptive language of the bill in a sense which the surveyor repudiates.

Now, without professing to attach to such reflections as these any more importance in practice than they really deserve, or without even desiring to press them at all, let us consider what a bill of quantities is, as one of the most ingeniously-devised refinements in the whole range of modern business. Miscellaneous persons, and especially merchants and lawyers, always look at a bill of quantities in one way ; they turn to the total of addition at the end and understand that something is to be supplied, a building to wit, for that sum of money, just as if it were a bale of cloth or a hogshead of wine according to sample, identifiable without any chance of mistake, and capable of delivery as easily and as promptly as by one of PICKFORD'S vans. No doubt there are a great many items in the bill, and probably, it will be said, a great deal too many for the occasion ; but that is somebody else's business and may therefore be passed by. What, however, is the fact ? In order to satisfy a commercially characteristic but commercially irrational English demand, it becomes necessary for the building trade first to determine the cost with perfect precision before the building is begun, and, secondly, to attenuate this price by a process of competition to the lowest limit that the trade can submit to. This is not done, for instance, in France, and, strange to say, it is not done in canny Scotland. The Frenchman and the Scotchman recognise the fact that a building is altogether too complex a thing to have a price put upon it in this definite way whilst as yet it exists only in imagination ; the English mind, on the other hand, in its fondness for simple issues, discerns no difference between the "delivery" of a building three or four years hence, or even fifteen or twenty, and the delivery of so many tons of coals or quarters of corn next week ; all alike are mere matters of contract—here the buyer and there the seller, and between them the agreed price as the connecting bond. Now it is plain that the application of this principle to a building must surely be a question of degree—a question of the complexity of the undertaking and of the time which is to be involved in its execution. A small building, that is to say, may be dealt with in a simple way, and a large one may not ; a work that is to extend over a few months may be contracted for without speculation, and one which is to run over many years becomes altogether speculative. The Scotch mode of contracting is, in this view of the matter, well worth considering, as affording a hint of what might have spared the public the pain of seeing the contractors for such a national work as the Law Courts in their acknowledged position.

The Scotch architect, as we understand, procures beforehand, upon the basis of his plans, not a contract, but an estimate. This is made by means of a bill of quantities, and is arrived at, of course, by the process of pricing every item ; but the resulting total is subject to revision after the work is completed. The surveyor, that is to say, having in the first instance measured all the work in anticipation from the drawings, re-measures the whole in realisation from the building itself, and the pricing of the items, transferred from the original tentative bill to the ultimate account of fact, produces a new total which is the sum that is payable to the contractor. It is easy for experts to see how this mode of procedure can be made to adjust or rectify, in the interest of fair play, almost any amount of honest misunderstanding ; and, if the final result comes out unexpectedly high, the proprietor is at any rate spared from the double annoyance of the same conclusion being attained, as it is in England, by a desperate pursuit of those exasperating additions called extras in the midst, perhaps, of scandal, reproach, and litigation. In the case of the Law Courts, as the newspapers have announced, the contractors speak of large claims for such extras ; and we cannot help submitting the

suggestion that, if any purse can be supposed well able to take the risk of a remeasurement within such limits as fair play may dictate, it is the purse of the nation—or that more plethoric pocket, the Sutors' Fund—in connection with an enterprise so grand as this, and so laboriously and perseveringly carried out.

If there were no other maxim of sound trading violated by our competition tendering, it must never be forgotten what serious chances there are that the lowest tender may be the result of some hidden blunder of calculation. Everybody knows how easily such errors creep in, and how serious they may happen to be. Everybody can also understand how unwilling, for half a dozen reasons, the "successful" competitor may be to acknowledge the mistake, and how hopeful of being able to counteract it by some one of the half a dozen possible means before the transaction is concluded.

On the whole we cannot help feeling that the system of competition tendering, as customarily applied to the difficult and complex business of building, especially when on a large scale, ought to be in some way or other reconsidered by architects in the interest of fair play. Eventual disaster to a much harassed and painstaking contractor is not creditable to the professional director in any case, besides that the recognition of the element of speculative hazard in such a business as building is neither creditable to the country nor safe for the employer.

THE PROPYLÆA AT ATHENS.*

SINCE the publication of Mr. PENROSE'S "Athenian Architecture" much has been written, and not a little done, to clear up the difficulties of the Propylæa. The pulling down of the great Turkish tower in 1874 was one of the best possible services, not only ridding the south wing of a vast encumbrance, but releasing many architectural members which have enabled a reconstruction to be made of this wing. It was there that the principal difficulty lay all along, and it is evident now that an abrupt change in the plan at this point had been forced on the architect, MNESIKLES. Since the removal of the Turkish tower, Mr. BOHN, whose work has just been published by the German Institute of Archæology, has made some excavations himself and has re-examined the whole question of the Propylæa, with results which cannot but be warmly appreciated, even if they do not at every point carry conviction. His results extend over twenty-one plates, and the subject is argued out fully in the text.

During recent years the discussion has turned mostly on the relation of the south wing of the Propylæa to the small temple of Wingless Victory, or, as she is more correctly called, ATHENA NIKE. For a time it was the almost general belief that this temple had existed previously to the building of the Propylæa, B.C. 437-432, and that it was its presence which had interfered with the plan of MNESIKLES. There was much to be said in favour of this notion. The axis of the temple does not at all range with the Propylæa, while, on the other hand, the lofty bastion on which the temple is built has been made to range with it, the inference being that it had been altered for this purpose without disturbing the temple itself, this alteration taking place when the south wing of the Propylæa was completed, or in process of completion. The finely-sculptured balustrade which surmounted this bastion, and is now, though much shattered and destroyed, the delight of lovers of Greek sculpture, was admitted to be of the date of this change in the line of the bastion. But as for the frieze of the temple, it was argued that it must belong to a considerably older period. The same was thought of the delicate proportions and execution of the architecture. It was known that KIMON, the predecessor of PERIKLES, had fortified the south side of the Akropolis, and it was thought natural that he might at the same time have erected the temple of Victory to celebrate his famous success over the Persians at the mouth of the Eurymedon. There were many misgivings, no doubt, whether this was not too early a date for the architecture no less than for the sculpture of the temple. But there the matter stood.

The result of Mr. BOHN'S investigations goes to show that the Temple of Victory, and the bastion on which it stands, were not planned until the south wing of the Propylæa was approaching completion, and that it was the introduction of this new element in the design which enforced MNESIKLES to

an abrupt change in that wing. If this is beyond all doubt, as it seems to be, the sculpture of the balustrade and of the frieze will belong to the same date—about B.C. 432—and a question will arise as to how best to reconcile the differences of artistic treatment which hitherto have been affirmed to exist between them. To assume a different hand would be an easy way out of the difficulty. But it should first be considered whether the much greater breadth of the balustrade, and the novelty of the subject—a long series of figures of Victory engaged in sacrificing or with trophies of war—was not likely of itself to have driven the sculptor to look for inspiration in a different quarter from that in which he found it for the familiar designs of the frieze, with its series of battles on three sides, and an assembly of deities on the front. We can imagine him turning to the frieze of the Parthenon, which is of about the same breadth, and on which are also figures leading cattle forward to the sacrifice. He is not in any sense a copyist. All that we contend is that the work of the frieze is as original as it is beautiful, that in several places the same turn of originality recurs in the balustrade, and that one sculptor, with a different source of inspiration for each, could perhaps have executed both.

Mr. BOHN'S examination of the north wing of the Propylæa with the Pinakothek forming part of it, has convinced him that the various theories of a stucco preparation on which frescoes had been painted, or of places for hooks on which pictures had been hung, are without foundation. The frontage of both north and south wings had the same form of pediment. There was no embellishment of sculpture on the Propylæa. The whole was a stupendous architectural design, which amazes still the visitor to Athens. How much more stupendous it would have been but for the outbreak of the Peloponnesian War it is impossible to say. But there is reason to suppose that considerable buildings had been planned, if not partly carried out, extending from the east of the north wing along on the Akropolis. That is a spot which yet requires a good deal of excavation. Even with allowance for a large extension of the Propylæa, the sum which is said to have been spent on the works sounds fabulous. The sum mentioned is 2,012 talents. Mr. BOHN computes that the buildings of the Propylæa cover 820 square metres, and that at this rate we should have to allow 552*l.* for every square metre.

One of the interesting sights on the Akropolis of Athens is that of the remains of rude massive masonry belonging to the older Propylæa, which crop up in unexpected places and reveal such facts as that MNESIKLES had taken a new axis for his structure. The older Propylæa had been a defensive work forming part of the fortifications of the Akropolis, and accordingly, was of the most massive description, little in keeping with the "wooden walls" of the oracle by which some Athenians thought the Akropolis was meant. Apparently there had been in some places wooden parapets or other defensive works of that material, for the Persians are said to have burnt them. When the long walls were built and the city protected by them, it was no longer necessary that the entrance to the Akropolis should be fortified. It was then that PERIKLES, with his architect MNESIKLES, conceived the idea of a splendid Propylæa without arrangements for defence, and altogether for display. But the great circuit of the city walls required a large military force, which Athens in time ceased to be able to provide. The walls fell under neglect, and again it became necessary to fortify the Propylæa. This seems to have been about the time of SULLA'S attack on the city. Subsequently under the Franks, and then under the Turks, those fortifications which still close in the entrance were raised, including the great tower, the demolition of which we have mentioned. It was Dr. SCHLIEMANN who urged and carried out, at his own expense, the demolition. BEULE'S gate, as it is called from the French scholar whose excavations at the foot of the entrance revealed the structure, is now generally accepted as part of the construction raised in Roman times.

It will be seen from Mr. BOHN'S work that the German Institute of Archæology supports and encourages very liberally its members resident in Athens. Naturally its attention is directed as a rule to more purely archaeological matters. But the questions involved in a thorough examination of the Propylæa are often more than architectural, and it was therefore well within the province of the Institute to direct a specially trained architect to the subject. It was almost imperative, if we consider the variety of hostile opinions that have been advanced in recent years by German scholars in particular,

* "Die Propylæa der Akropolis zu Athen." Richard Bohn. Berlin.

RENAISSANCE DETAILS.*

AT a time when so many are turning their thoughts southwards, in the belief that English architecture and ornament in general will for some years to come be derived from Italy, the publication of Mr. KINROSS's "Details" is most opportune. We may say at the outset that for practical purposes the volume is invaluable. As an architect Mr. KINROSS is aware of what is likely to be needed by artists; and he has produced his book in the form that is best adapted for the attainment of that end. The ornament is throughout in outline, but it is drawn with feeling and with a desire to express faithfully the details of the original. A book more showy and more attractive to the uninitiated could have been prepared with less labour. Mr. KINROSS does not introduce striking effects of light and shade to hide defective drawing, or scamp details for the sake of the picturesque. His style is artistic and is equal to the delineation of the richest Italian work, while it is so definite throughout that the plates might be put into the hands of a workman to be executed. If it were only for the draughtsmanship the book is deserving of commendation. There is a kind of sketching sometimes employed which is apparently founded on the principle that a part is better than the whole, and that if the fancy can be excited by a few scratches, it matters little whether the notion formed of a work is right or wrong. The late Rev. J. L. PETIT may be said to be the founder of this style, and although people talk of its "breadth" and "effect," it is entirely delusive. It is creditable to Mr. KINROSS that in his fifty plates not one example is to be found which suggests that it was made in a hurry. The subjects were drawn to scale, and their character suggests that they were completed on the spot.

In arranging the plates the alphabetical order of the towns has been followed. First we have the beautiful pulpit in the lower chapel at Assisi. The length of it allows of dramatic action in the preacher. The twisted columns, which vary in the lines of the spirals, and the capitals, in which the acanthus is freely treated, with occasionally a bit of foliage that seems to have been derived from more northern work, are interesting and suggestive. Mr. KINROSS says the pulpit "owes its beauty to the simplicity of the design and the quiet rich colour of the marble brightened with the sparkling colour in the bands of glass mosaic. The twisted columns take away any stiffness that the design might otherwise have, and the projecting part is emphasised by the columns round it being made richer than the others with the addition of spiral bands of mosaic." Another plate shows a doorway from Assisi having a semicircular head, with a figure of St. BERNARDINE, the Franciscan reformer (who first employed the initials I.H.S.), and two angels in the tympanum. The ornament on the pilasters is somewhat conventional, but it indicates a desire in an inferior artist to secure correspondence without repetition. The ardour of the saint is typified by the flames that issue from the candelabra on the side pilasters. A fine wheel window is taken from a small chapel in the same town, and Mr. KINROSS remarks that in it, and in all similar to it in Assisi, "the glass, supported by strong iron bars, is set well behind the columns, which are thus fully shown and are never spoilt by having the glass inserted in them." Two screens are taken from St. Petronio, Bologna, a church that is associated with the names of many famous artists. Mr. KINROSS acknowledges that the beauty of many of the works he represents arises from the colour of the materials which are used, but he endeavours to make up for the want of colour in the plates by his descriptions. The Court of the Fava Palace in Bologna, which forms the subject of the eighth plate, is curious. The corbels are large enough to sustain a locomotive; but, as is not uncommon in Italian buildings, where great strength and great weakness appear side by side, the arches in the court have to be secured by strong iron ties. Corbels are common in Bologna; and the contours "vary with the material of which they are made; when of brick they are severe in outline, and when of stone or marble they are very free in their lines." An arcade from Sta Maria dei Miracoli, Brescia, is excellently treated, although the arches do not spring directly from the columns. Somewhat similar in style are two columns from St. Criste and the Museum in Brescia, thus suggesting local influences. From the Certosa of Pavia some exquisite details have been copied. They show the tact with which ornament

was applied by the Italians, and how flowing and rigid lines were contrasted in planning the details. There is only one drawback; and that is the want of suggestiveness in the foliage. There are leaves, stems, and flowers, but they might be the work of men who had never seen natural vegetation, and in remedying this defect lies one of the opportunities for modern designers who adopt Italian principles.

Florence is a mine for details, and alone would afford materials for many volumes as large as Mr. KINROSS's. Among the plates are a part of the sarcophagus of CARLO MARSUPPINI, which is the masterpiece of DESIDERIO DA SETIGNANO; and might be taken for a Greco-Roman work; the gallery in San Lorenzo, in which there is no part unornamented; the pulpit in Santa Croce, by BENEDETTO DA MAJANO, with its panels illustrating the life of St. FRANCIS; the porphyry and bronze sarcophagus by VEROCCHIO, having foliage that is unsurpassed in crispness; the slab that forms the memorial of Bishop KETERICH, of Exeter; various specimens of woodwork in the sacristy of Santa Croce; and the beautiful inlaid marble screen in San Munato. From Perugia we have the magistrates' bench in the Cambio, a piece of work which is worthy of a hall which PERUGINO and RAPHAEL painted. Examples are also given of the famous woodwork in Siena and Pisa. The interest of the Sistine Chapel is usually concentrated on the paintings; but the screen and gallery are richly carved, although there is little inspiration or freshness in the ornament. Better in style are the plates in which the various styles employed in Venice are illustrated. Many interesting subjects have been derived from Verona, in which some of the finest Renaissance carving is to be found.

PARIS NOTES.

THE Prefect of the Seine has issued a list of the money-prizes to be paid to the architects who took part in the late competition for the reconstruction and enlargement of the Sorbonne. M. Lasche, who was classed second, receives 15,000 frs.; M. Albert Ballu, a son of the architect of the Hôtel de Ville, 12,000 frs.; M. Formigé, 10,000 frs.; MM. Gabron and Vandoyer, 8,000 frs.; and M. M. Mariand, Corsel, Lheureux, and Hermant, 4,000 frs. apiece. M. Nenot, the young victor in the competition, is entrusted with the carrying out of his designs, and will thus be paid professionally.

The following awards have been made at the Ecole des Beaux-Arts during the past week:—In the quarterly competition in "Oil Sketches" the jury gave a third medal to M. Georges Lousset, pupil of M. Cabanel and Maillot. In the competition "A Face Drawn from Nature," a second medal was awarded to M. Lavalby, pupil of the same artists; and third medals to M. Merlin, a pupil of M. J. P. Laurens, and to M. Bergerin, pupil of M. Gerome. In the "Sculpture" competition M. Catanio, pupil of M. Cavelier and Gauthier, and M. Verlet, pupil of M. Cavelier, carried off third medals. It will be observed that no first medals were awarded in any of the competitions.

The dates have been fixed for the Prix-de-Rome competitions of the present year. In "Painting" the entry *en loges* will take place on April 23, and work will continue until July 17—seventy-two days in all, without counting Sundays and holidays. The result is to be made known on July 28. In "Sculpture" competitors will likewise have seventy-two days' work, from May 1 to July 25; while in "Architecture" 110 days are allowed.

M. Logerotte, Under-Secretary of Public Instruction and Fine Arts, accompanied by several artists and members of the Department, lately visited the old Palace of the Conseil d'Etat and Cour des Comptes, with the object of examining in detail the mural paintings by Chasserian, regarded as the best work of the master, and which fortunately remain in a fair state of preservation. As a result of the visit, it is announced that these remarkable frescoes are to be transferred to the Ecole des Beaux-Arts.

The death is announced of Dr. Paul Durand, aged 76. At an early age the deceased abandoned the medical profession, for which he had been brought up, and devoted his long life to archæology, of which he became one of the most distinguished representatives in France. He took an active part in the restoration of the Cathedral of Chartres, and several other religious edifices.

From Amsterdam it is reported that, as the result of a conference between the Dutch Executive Commission and the

* "Details from Italian Buildings, chiefly Renaissance." By John Kinross, Architect. Edinburgh: George Waterston & Sons.

delegates of the French Committee for the Amsterdam Exhibition, several important resolutions have been adopted. The following are the most noteworthy:—1. That all collections of a scientific character or belonging to the French Government shall be admitted free. 2. That an area of 100 square mètres shall be placed at the disposal of the city of Paris for its collection illustrative of the various municipal services. 3. That exhibitors of machinery shall be entitled to a reduction on the price of their stands in proportion to the amount of space they occupy. 4. That the period for the reception of exhibits shall be prolonged to January 31. 5. That the discussions, meetings, and lectures of the Congress shall be conducted in the French language.

While the organisation of the new Worlds' Fair, to be held in the commercial capital of Holland, is thus being completed, the last traces of the Paris Exhibition of 1878 are being cleared away by the levelling of the Champ de Mars. The materials of the numerous buildings are scattered far and wide. The City of Paris Pavilion has been re-erected behind the Palais de l'Industrie, in the Champs Elysées; a part of the iron work of the main gallery has been utilised in the construction of a market at Bordeaux; fragments of the fine architectural façade of the Belgian section are now to be seen in different parts of Paris. Many other of the foreign pavilions have been purchased by private individuals for the ornamentation of their parks and grounds. A Chinese pagoda that figured in the Champs de Mars now crowns an eminence in a property of the Department of the Seine-et-Marne, and a Japanese pavilion graces a garden at Saint Germain-en-Laye; finally, many Governments have themselves removed the materials belonging to them. One relic, however, and that the greatest of all, still attests the splendour of the late Exhibition, for the Trocadéro, dominating with its lofty towers and wide-stretching wings the heights of Passy, is without dispute one of the finest and most conspicuous structures in the modern Lutetia.

The members of the special committee appointed to examine and report upon the various projects for a metropolitan railway have come to the conclusion that not one of the schemes put forward answers the end in view. The committee have, therefore, decided that it would be useless further to examine the various projects, but at the same time they express the opinion that some of the lines might be adopted with advantage as branches or feeders of a main metropolitan system in connection with the main lines converging on Paris. In this view three plans are recommended to the consideration of the Government, viz., those of Messrs. Chrétien, Ollivier, and Jullien, which are respectively for lines worked by electricity, chains, and electricity and chains combined.

In reconstructing the bridge over the Seine at Ivry, a suburb lying just above Paris, the city architects and engineers have devised a method of executing the work without interfering with the river traffic. A police order announces that the navigation will be interrupted successively under each of the five arches of the bridge as the work progresses. Thus only one arch will be closed at a time, and the inconvenience will be trifling.

ON THE USE OF BUILDING STONES.*

BY JAMES GOWANS.

IN the paper I had the privilege of bringing before the Association last winter,† I pointed out the characteristics of good building stones, and the principal quarries in Scotland from which such could be got. I stated that what the architect had to look for was a stone that was durable, strong, and of a colour which would best bring out the architectural features of his design and harmonise with the locality and surroundings in which it was placed. We have, fortunately, within easy reach, abundance of stone combining these qualities; but, however good or beautiful it may be, if wrongly used, disappointment and failure are sure to be the result.

The laws observed in regulating the elements and forces in Nature are thoroughly geometric, and the same laws are equally binding on the architect in his works. The constructive lines on which Nature proceeds never fail, when free from debasing influences, to secure what we call beautiful in form, colour, or usefulness; and the same lines cannot be too closely followed by the architect or builder who desires to reach excellence in an art which is noble in the highest sense of that word.

I know that it is held by many that the architect or artist is

only trammelled in his conceptions by working on geometric lines. Some men, no doubt, have an intuitive perception of what is symmetrical and beautiful either as to form or colour, just as there are those who, without the aid of gamut or scale, have an inborn knowledge of what is harmonious in music; but I hold that in architecture, as applied to the True styles, a geometric basis is at the root of what we admire in the examples we have of these; and that, if a new style of architecture is to be developed, we must fall back on what guided the old designers in their original conceptions of what was not only true to its use, true in construction, true in symmetry, but beautiful as well, because it *was true*—the cube, the circle, and its geometric development giving that which we admire and call Classic, while the circle and the equilateral triangle supply the key to those noble Gothic structures which were erected five hundred years ago.

Before I enter upon the consideration of the uses of stone, I wish in a sentence or two to notice the use of timber and iron as constructive materials. There is a true way of using these, just as there is a true way of using other building material, such as stone; but a serious mistake will be made by the architect or engineer if they attempt to use these on the same lines or for purposes which by their nature they are not at all applicable. As to the first, the designer who understands what timber as a constructive material can do would never think of using it for the purposes of an arch; especially one which has to meet the strain of a vertical and moving load. Yet this has been done on some of our most important railways in the construction of bridges and viaducts. Neither should iron be used for purposes which stone or other material is only fit for. To build a structure on constructive lines which admit of play or movement when the weight and thrust of a railway train or moving force comes against it, or upon it, is certain in time to be fatal. Hence the care that should be taken whether with stone, wood, or iron, to adopt a system of construction which will not only meet the nature of such material, but the work it has to do.

To unite wood and iron, where their opposite properties can never harmonise and work together, is sure to fail in the long run, as, under a strain or load, timber, from its greater elasticity, will yield to the pressure, but again recover its normal condition after the strain or load is removed. Iron, on the other hand, will keep the set it gets, and if united to the timber, is certain to drag it down to the weakness which is inherent to such a combination of material.

What I have said about wood and iron is rather aside to my paper, except in illustration of what I consider so nearly allied to the use of stone that I trust the Association will overlook the digression. The right use of stone is my subject, and I will endeavour to keep as close to my text as possible, giving in a practical way the results of my own experience, and what I have learned from others. To be in order I will consider:—

1. How to secure a foundation upon which the structure can be safely built.
2. How to place stone in the building so as to secure the greatest strength and durability.
3. How to use stone in the laying of a good foundation.
4. How to use stone in the building of retaining walls.
5. How to use stone in the building of rubble.
6. How to use stone in the superstructure.
7. How to use stone for coursed work.
8. How to use stone for ashlar work.
9. How to dress stone so as to get the most durable surface.

1. How to Secure a Foundation upon which the Structure can be Safely Built.

The foundation of a building is of primary importance, as, unless it is secure, the permanency of the structure cannot be maintained, however well built it may be.

Before laying a stone, the architect or engineer should be satisfied that the strata will give equal resistance to the pressure that may be put upon it.

Strata that is hard and soft is very dangerous. Even clay if mixed with boulders (which often happens) cannot be depended upon, unless they are removed, and means taken to equalise the ground on which the buildings are to be erected.

Next to rock, no better foundation can be got than sand or gravel when dry. If wet, means should be taken to drain away the water; but, if this cannot be done, large, flat-bedded foundation stones of sufficient area, fairly dressed in beds and joints, and well put together, will, as the load increases, secure a foundation that anything can be built upon.

In my own experience I have often tested this, and particularly when building a bridge on a railway contract I had many years ago. This was an under bridge of considerable span, the girders being in the form of an arch, in segments of cast iron, the security of which depended greatly on the permanent resistance of the abutments, or the bolts which held these segments together at their joints. In digging for a foundation, it was found that the strata was very soft, being layers of sand and moss alternately, and to prevent failure I took the precaution to strengthen the foundation of the first abutment by driving piles to a depth of 30 to 40 feet, with horizontal planking, on which the foundation stones

* A Paper read at a meeting of the Edinburgh Architectural Association on the 17th inst.

† See *Architect*, vol. 26, p. 343.

were bedded. Before building the second abutment, acting on the advice of a railway contractor who had had more experience than myself, I adopted a different plan, viz., to dig out the soft material to such a depth and area as secured an outward resistance to meet the pressure of the large-sized stones that were afterwards put into the foundation, course after course, until the load pressed out the water, and so secured a foundation which was equally as strong, if not stronger, than the first.

Where the strata is unequal or not to be depended upon, I know of nothing better than a good bed of concrete, certainly not less than 3 feet thick, and no architect should neglect this where there is the slightest doubt as to the sustaining character of the ground. This is always necessary in erections of different heights, and is particularly required in churches and other buildings where the spire, tower, or other elevation bears more heavily on the foundation than the walls which abut upon them. And, in addition to this, and to make sure, I would have extra courses in the foundation of the higher and heavier portions, as in the hurry with which we build, nowadays every precaution is necessary. The same care should be taken with respect to oriel windows or projections which do not go to the full height of the building, and consequently have not the same pressure on the foundation.

The walls to which these lighter projections are attached should not only be well founded, but the tie or bond which unites the one wall to the other should be left free on the upper beds, so as to allow for the subsidence of the heavier wall without causing the fractures so often seen where this precaution is not taken.

2. How to place Stone in the Building so as to Secure the Greatest Strength and Durability.

Before saying anything as to the various kinds of work put upon stone, or the modes of building, let me state that for durability all stones should be laid on their natural beds, especially such as are highly stratified. All stones, however compact in their nature, have a line of fracture, which the quarryman or hewer can easily detect; and although there are a few stones, such as the Liver Rock of Craigleith, Binnie, and Redhall, which show little lamination, and may be used with the natural face exposed; the use of stone in this way should be the exception and not the rule.

Another consideration in the use of stone for important buildings is that of having it quarried, stored, and seasoned for some time before being hewn and placed in the walls. By these means the natural sap is allowed to evaporate, and the stone tested as to its quality. This would add to the cost; but the money would be well spent if this precaution prevented the wasting of stones from the rains, frosts, or atmospheric influences which, especially in our cities, soon act on the surface of a newly-quarried stone.

Stone that is quarried the one day and built in the next is in a green state, and unfit for use. It is not in condition—it is at its weakest; its pores are open and ready to absorb not only moisture, but the gaseous and disfiguring influences which tend to its destruction. Every hewer knows that to get a polished surface on a stone that has lain for some time is very different from what he gets on one fresh from the quarry, and this of itself should be sufficient evidence to warrant the precaution I have recommended, which is to thoroughly season the stone before using.

To know what good stone really is, and how it can be best used, the architect who practices in this city, or the student, has not far to go to see not only the most durable stone, but also variety of masonry, as exemplified in such as Holyrood, Heriot's Hospital, and the residential buildings of the Old Town, erected centuries ago; or, turning to the modern buildings of the New Town, stone of equal durability and variety of masonry, as shown in the polished work of the better class buildings of the terraces, crescents, and squares, such as Royal Terrace, Randolph Crescent, Moray Place, or Charlotte Square; while in George Square, Gilmore Place, Thistle Street, Rose Street, or Jamaica Street work of a cheaper kind has been adopted, all which are not only instructive, but interesting, in showing what masons could then do in erecting buildings that have stood the test of time, which makes no mistake in exposing what is good or bad in many things besides the art of building. My next consideration is—

3. How to Use Stone in Laying a Good Foundation.

In my Paper on "Building Stones" I gave the result of some experiments in testing foundation-stones for the chimney of the Edinburgh Gas Company, and the result of these experiments proved to my mind that as you enlarge the area of the stone a greater proportion of resistance is gained, and that a laminated stone, such as Hailes, would increase in strength according to its surface more in proportion than that of a Liver Rock stone, such as Redhall or Craigleith.

I notice this more particularly to show that a soft stone need not be rejected if laminated, of large area, fairly dressed on the beds and joints, and bedded on what I would call a swimming bed of mortar, so that every portion of the surface of the stone would get a fair share of the work it had to do.

Foundations should have the courses of sufficient breadth to admit of scarcements on either side, and all round, so that the wall, pier, or pillar resting thereon may have a good footing, and

equal resistance through and through to prevent sinking. I have known, from the neglect of this, worse than subsidence happen, owing to the foundation courses being filled with ordinary rubble in the centre, which, yielding when the pressure came, brought down the building, involving not only loss of life and property, but questions of responsibility that had to be settled in a court of law.

The subsidence of the walls of a building occasioned by a bad foundation or inferior work above does not show itself all at once—it takes time to tell whether the foundations have been well or ill laid upon an unyielding strata, badly bedded stones, or a faulty construction; but once it does begin to fracture, the unequal, and what I would call the unfair, strain that is thrown upon other portions soon leads to serious consequences.

4. How to use Stone in the Building of Retaining Walls.

The chief object here is to build so as to lean to and resist pressure from behind. To do this satisfactorily the excavations should be dug deep enough to secure the resistance necessary to meet the thrust when it comes; the walls should be built of the largest material that can be got, and bedded at right angles to the batter on the face. Small-sized stones in such a wall are useless. Heavy material, well dressed and bonded together, so that when the pressure comes—in most cases suddenly—every stone will be ready to take its fair share in preventing an overthrow—that is what is wanted, not small-sized material which has no time to bond and get that unity of resistance which such a structure requires.

5. How to use Stone in the Building of Rubble.

Of walls built of rubble there is a great variety. Common rubble masonry or walls built with stones of irregular shape as they come from the quarries, if well put together, well dressed, well knocked to their bed, and built from front to back, so as to bond and get them to work together, enduring walls may be built; but if, on the other hand, as is too often the practice, such work is done by running up one side of the wall before the other, without bond or ties, such as are required to unite the whole, then nothing but failure can be the result.

There is another kind of rubble of which we have some admirable examples in the city—that is, coursed rubble. This work was done entirely with the pienen hammer, without chisel mark of any kind; and when well bonded and backed, walls of the most enduring kind were got.

Where what is called squared rubble is adopted, with ordinary rubble for backing, the practice of running up the outer face should not be allowed. No worse masonry could be built than this, and it is to be regretted that so much of this kind of work is being done in our city. It is not only bad in itself, but leads to our younger masons being trained to a most objectionable style.

Speculation in building, where cost appears to be the first consideration, has led to much of this kind of work, although I am by no means sure but what there is something else to be blamed, and that is, that many of our masons have not been properly trained, owing greatly to their being allowed to break their indentures, and not serving their full time of apprenticeship.

Masons were better trained when it was more the custom than it is now of indenturing apprentices for a term of years, usually five. Three were devoted to the art of hewing, and two to the art of building. When the term expired it was usual for the master to attach a certificate to the indenture stating how good an apprentice he had been, and his qualification to take his place as journeyman; and he was proud of the document as showing what he was and what he could do. This was a good custom, and one which I would like to see revived by the masters or workmen's unions, whose interest it should be to have well-trained men in their ranks.

In specifying rubble work architects should be careful in making clear the kind of work they require, as many questions have had to be settled in court which might have been avoided if more clearly described, or if, what is better still than any specification, the kind of work was shown to contractors before estimating.

There are so many different kinds of rubble, such as common, squared, random, hammer-dressed, nidded, and pick-dressed rubble, and rubble where the stones are limited in length, height, and breadth of bed, which comes to be a puzzle to the mason, if specified for walls, such as I have seen built in this city. These should be made perfectly clear by the architect by sample, so as to prevent after disputes, and show exactly how the stone is to be treated.

Another kind of rubble which was much in vogue when the houses in Moray Place, &c., were built, as shown in the back walls of the same, and also in the front of the older houses in George Square and Gilmore Place, was that of coursed rubble. As the term indicates, the stone was taken from the rubble, squared and faced entirely with the cairn hammer I have before alluded to, and it is well to notice from these examples how shapely and well done the work is—some of it brought to a surface by squaring the stone so as to show the natural face, and others by using the pienen hammer for dressing off any inequalities, and bringing it more within the term of what we call "nidded" work, only with much less labour than that required for this more costly style of masonry.

(To be continued.)

NOTES AND COMMENTS.

THE Institute of Painters in Water Colours have announced that their new galleries in Piccadilly will be an open exhibition to all painters in water colours. It is also the intention of the Council to open schools for the education of students in the art of water-colour painting, and endeavour to do for the student in water colours that which has been so well done for the student in oil by the Royal Academy. The classes will include all branches of the art, the principal of which will be figure, landscape, and still life, and in addition to these instructions will be given in monochrome for the purpose of illustration and drawing on wood. These schools will be entirely free, and the members of the Institute will supervise the instruction to the students as now practised by Royal Academicians. The students will be required to submit drawings to prove their qualification to take advantage of the schools, as it is not the intention of the Institute to give elementary instruction. Prizes of gold and silver medals have already been promised, and any assistance of sympathisers in this direction will be gratefully acknowledged by the Council of the Institute.

IN order to diminish the risk of accidents like that at Bradford, Messrs. LEEMING & LEEMING, of Halifax, state that they make it a rule to insert the following clause in their specifications: "The Borough Analyst for Halifax shall at such time as he or the architects to the works think proper, take samples of the mortar and subject them to analysis." This is found to be an excellent preventive against "jerry building," as the terror of a fine and the exposure is sufficient to ensure mortar of a first-class kind. It is impossible always to ensure good material in the ordinary way architects use to supervise the mixing of the mortar, as it is at the best but a "rule of thumb" procedure. The lime may be in excess, thereby producing a mortar of a friable nature, or the particles of sand may be of a globular instead of a polygon-cubical form. A ready way of testing the sand is to examine it under an ordinary microscope. The lime is only the matrix or cementing agent in the mortar, causing the particles of sand to adhere to each other and form a concrete mass.

DOUBTS having arisen in the minds of several of the architects who intend to compete for the Nottingham Municipal Buildings, as to the necessity or advisableness of submitting elevations as well as plans in the first competition, the question has been referred to the committee by Mr. TARBOTTON, who has hitherto uniformly stated, when applied to, that elevations were not required but were not prohibited. The committee now say that elevations in the first competition are not necessary and are prohibited, and that the instructions as to the mode of competition (pages 1 and 2) must be strictly complied with. Several intending competitors having inquired whether the plans in the first competition will be submitted to an architectural assessor, it is now stated that the Corporation will take provisions to be properly advised.

A FULL-SIZE model of a man has been placed in a corridor of the Royal Courts of Justice. It is by some of the passers-by supposed to represent the late Mr. STREET. But this must be an error, and it is more probable the model is intended merely to indicate the height the proposed statue is likely to be. As a figure, whoever may be the subject, it is most ungraceful. If our readers will imagine the unhappy victim in Mr. MARKS'S *Toothache in the Middle Ages* to be standing and clothed in modern costume, they will be able to form a notion of the "statue." The man has his legs crossed in a way that may be suggestive of sudden pain of some unknown kind, and he holds one hand to the cheek which is aching. Under the circumstances, a pleasing expression of countenance is not to be expected, and it must be admitted the modeller has succeeded in showing how a face looks "when pain and anguish wring the brow." It is, however, unwise, considering the state of the funds of the STREET Memorial, to put such a figure in a public place. The size of the proposed statue could have been suggested in some other way, or by a figure of a different kind. Now we fear intending subscribers will be frightened, and with reason, for Trafalgar Square has been outdone.

THE Society of Painter-Etchers will hold an Exhibition, which will open on March 1, for (about) six weeks. All forms

of engraving on metal, whether by the burin, the etching-needle, by mezzotint or aquatint, or by whatever other process the artist may choose as a means of original expression, are understood to be included in the term "painter-etching," and, subject to the approval of the Council, are eligible for exhibition, whether the artist sending them be a Fellow of the Society or not. Works sent for exhibition, besides being original, must be the *bonâ fide* property of the artist, and directly contributed by him, or by his written authority. No works being the private property of a collector, or forming part of any printseller's stock, or which have been previously exhibited or offered for sale elsewhere, can, under any circumstances, be admitted.

HERR C. PUSCHER has found by experience that the only substance really efficacious for rendering cements unalterable in the air is a cold solution of one part of sulphate of iron in three parts of water. The cement samples are left immersed in this solution for twenty-four hours, at the end of which time they assume a greenish-black tint. The absorbed solution is decomposed in the interior of the cement, its weight being increased one-tenth per cent. All the pores are thus stopped up; and, as this combination is unaffected by the air, the cement itself becomes unalterable. To protect the fronts of houses faced with cement, they are painted several times with the solution; and, after drying, the cement is covered with a coat of ochre. A lighter tint is obtained by the addition of 10 per cent. of sulphate of alumina; while, to produce a greenish-white, a solution of chrome alum is used, followed by the water of cocoa-nut soap. Over these various substances painting in distemper may commence immediately. As to oil-colours, it is well known that they soon peel off if applied to cement alone. This is avoided by brushing the cement over with soapy water, allowing it to dry, and rubbing with a brush or a cloth until the surface becomes shiny.

THE Solihull Rural Authority at a meeting on Wednesday accepted the resignation of their surveyor, Mr. A. T. DAVIS, consequent on his appointment as borough surveyor of Stratford-on-Avon. One enlightened member of the Board said he hoped another surveyor would not be appointed, as he considered the employment of such an official to be an actual waste of money. As it appears that Mr. DAVIS while surveyor has, in one department alone, saved the Authority the amount of his salary and has avoided expenses the Board might have incurred without the skill of a professional man, it perhaps may be concluded that this gentleman did not undervalue the services of the surveyor, but, like many other bodies where architects and surveyors are concerned, would like to have their services for nothing. The vice-chairman, however, did not coincide in this view of the question, and remarked very much to the point that unless the Authority appointed another surveyor Solihull would become the home of every jerry-builder in the country. We might, perhaps, for the benefit of the country at large recommend that the Authority should take no steps for the appointment of a fresh surveyor. What a blessing it would be if even a tithe of the jerry-builders were attracted to Solihull.

THREE HUNDRED THOUSAND cubic metres of stone are, on an average, used every year in Paris alone; and each cubic metre has from 6 to 8 square metres—say yards—of sawn surface, which costs 10fr. (8s.) per square metre. Consequently the sum paid yearly for sawing the stone used in Paris may be estimated at 20,000,000fr., or 800,000l. While great improvements are being constantly made in saws for timber, stone is, as a rule, still sawn in the same primitive manner that has been practised for ages past. M. PAULIN GAY has, however, conceived the idea of applying the principle of the band-saw to stone. He mounts, on a couple of specially-grooved pulleys, an endless cord, consisting of a strand of three steel wires twisted to a uniform pitch. At the same time that the cord revolves at a high speed, it also turns upon itself with a gyratory motion, the effect of which is to keep the cut constantly clear of the *débris*. The cut is effected by means of sand falling from a receptacle above, and carried along in the interstices of the wire cord; while a stream of water serves to keep the cord from heating with the friction. The bed of the machine carrying the block of stone is fed up by a self-acting arrangement that can be adjusted according to the hardness of the material to be cut, and several cords may be made to revolve side by side for cutting the slabs.

DESIGN FOR CEMETERY CHAPELS, STOKE UPON TRENT.

ILLUSTRATIONS.

A HAPPY LAND.

IN the last Salon there were two examples of wall decoration by M. PUVIS DE CHAVANNES. They were awarded the gold medal of the year. The larger one, *Young Picards exercising with the Lance*, has been by the artist's kind permission already illustrated in *The Architect*. We now give his second work, which is a memorial of M. PUVIS DE CHAVANNES' friendship for M. BONNAT, the eminent portrait painter.

THE "ROYALTY" CONGREGATIONAL CHURCH, ETC., SUNDERLAND.

THE above new buildings when completed will form a most prominent feature at the junction of the "Royalty" with Chester Road. The whole scheme comprises the erection of a church, school, infants' room, vestries, kitchen, heating chamber and other appurtenances, and a minister's house. The style chosen is Romanesque in character, as one in which a good effect might be obtained without going to any great expense in enrichment. The buildings are to be of brick throughout, and will be relieved with blue brick bands, stone courses, and stone dressings. The church will be 70 feet long by 44 feet wide, and will accommodate 516 adults on ground-floor, but with galleries (for which provision will be made) the total number of sittings may be increased to 850. The roof timbers will be partly exposed to view, and the ceiling, which is waggon-headed, will be divided into panels. The spirelet, which will be utilised for ventilating purposes, rising to a height of 80 feet from ground. The schoolroom stands at right angles to the church, and is 71 feet long by 34 feet wide, and will accommodate 646 children; the roof is similar to that of church, but the centre portion is raised in such a manner as to form a well-lighted clerestory on each side. Between the church and school stand the vestries and kitchen, and at the further end of school access is given to the infants' room, which is 18 feet long by 14 feet wide, and has seats provided for 60 infants.

The church and school will be heated by means of hot air, lighted by means of gas corona suspended from roofs, and ventilated by means of adjustable ventilators in ceilings, communicating with the outer air.

The remaining portion of the site is to be occupied by a minister's house, which will contain seven rooms and three attics.

The entire site will be enclosed by a wrought-iron railing, surmounted on a stone plinth, and the space between the various buildings will be laid out as a garden, and planted with shrubs, &c.

The building of the schoolroom, infants' room, kitchen and appurtenances was commenced by Messrs. HIRST & SONS, the contractors, at the end of January 1882. The building of the church and minister's house will be commenced in a year or two, when funds will permit. The present erections have been satisfactorily carried out at a cost of a little over 1,600*l.*, and it is believed that the remainder of the scheme will entail a further outlay of 3,500*l.*

Mr. H. T. GRADON, of Durham, is the architect of the entire scheme, and under his directions the above works have been carried out.

HOUSE AT MINSTER, ISLE OF THANET.

THIS illustration shows the proposed alteration to a house at Minster, which is on the ordinary speculative builder plan—a passage, with rooms on either side, and a staircase at end of it. The rooms are very small. The drawing shows the new bay window and conservatory; to the drawing-room a dining-room has been built on behind. The roof is to be new, so as to form four good rooms in it and a belvedere on the top, from whence there is an extensive view. The bay on the left side already exists. The architect is Mr. S. VACHER, A.R.I.B.A.

DESIGN FOR STOKE-ON-TRENT CEMETERY CHAPEL.

THE illustration has been reduced from a much larger drawing, submitted by Mr. MARK J. LANSDELL, of Bedford Row House, W.C., and Hastings. There would be two chapels, each with an attached vestry. A novel feature is the introduction of two covered carriageways, with bell-turret in the centre. By this arrangement the two chapels are grouped in one building, though for all practical purposes they are each quite distinct the one from the other.

THE VICARAGE, ST. ANNE'S-ON-THE-SEA.

THIS building has been lately erected from the designs of Mr. R. KNILL FREEMAN, F.R.I.B.A., at the cost of Lady CLIFTON.

ARCHITECTURAL COMPETITIONS.

THE following revised suggestions for the conduct of architectural competitions have been proposed by the special committee of the Institute:—

1. The promoters of an intended competition should, as their first step, appoint one or more professional assessors, architects of established reputation, whose names should be published in the original advertisements and instructions, and whose decision should govern the selection of the designs in all stages of the competition.

2. The duty of these assessors should be—

a to draw up the particulars and conditions, or to advise upon and, should it be necessary, revise or supplement them if already drawn up;

b to determine which of the designs conform to those instructions;

c to exclude all others; and

d to advise the promoters on the relative merits of the designs admitted to the competition.

3. Every member of the body promoting the competition, and every assessor engaged upon it, should abstain absolutely from taking part in the said competition, or from acting as architect in the execution of the proposed work.

4. The number and scale of the required drawings should be distinctly stated, and they should not be more in number or to a larger scale than necessary to clearly explain the design. If perspective views be required, they should be uniform in size, number, mode of colouring, &c.

5. Competitions should be initiated either (A) by inviting preliminary sketches, involving only moderate cost to each competitor, preparatory to a final competition; or (B) by invitation without sketches; or (C) by personal invitation.

If (A)—By advertisement, inviting architects willing to compete for . . . (here describe the intended works) to send in their names by a given day, on receipt of which each applicant to be supplied with the instructions prepared under the advice of the professional assessor or assessors. Each applicant, from such instructions, to send in by a given date a sketch design (here describe the limit and character of such sketches). The promoters, with the advice of the professional assessor or assessors, should select from such sketch designs not less than . . . (here specify the number), the authors of which should be invited to join in a final competition, in which each should receive for the preparation of his design a sum to be fixed by the promoters, with the advice of the assessor or assessors. From these designs a choice to be made of the architect to carry out the work.

If (B) without sketches—By advertisement, inviting architects to compete for . . . (here describe the intended work) to send in their names by a given day, with such other information as the candidate may think likely to advance his claim to be admitted to the competition. From these names the promoters, with the advice of the professional assessor or assessors, should select . . . (here specify the number) to compete, and each competitor thus selected to receive £ . . . (here state the amount) for the preparation of his design. From these designs a choice to be made of the architect to carry out the work.

If (C)—By personal invitation to a limited number of selected architects, to join in a competition for . . . (here describe the intended work) each competitor to receive £ . . . (here state the amount) for the preparation of his design. Such remuneration to be fixed by the promoters acting under the advice of the professional assessor or assessors. The author of the design which may be awarded the first place in point of merit to be employed to carry out the work.

6. Each design should be distinguished only by a motto or device, and any attempt to influence the decision of the promoters, or of the assessor or assessors, should disqualify a competitor.

7. A design ought to be excluded from a competition—

a if sent in after the period named (accidents in transit excepted);

b if in violation of the instructions;

c if it do not substantially give the accommodation asked for;

d if it exceed the limits of site, and

e if the assessor or assessors (with or without the assistance of a surveyor) should determine that its probable cost will exceed the intended outlay, if specified in the instructions, or the estimate of the competitor should no outlay be specified.

8. It is desirable that all the submitted designs in a final competition under Section A of clause 5, except any excluded under clause 7, should, with the consent of their authors, be publicly

exhibited after the final award. The decision of the assessor or assessors and of the promoters should be published at the time of exhibition.

9. The work, if carried out in any shape, should be placed in the hands of the architect whose design has been adjudged to be the best, and he should be placed in exactly the same position in relation to the employer and the intended work as he would have been had he alone been professionally consulted. In case a competition has resulted in the selection of an architect, and the instructions to him to proceed further in the matter are not given within twelve months from the time of the architect being so selected, he should be paid at the usual professional rate, under the advice of the assessor or assessors, exclusive of the sum paid to him in common with the other competitors. Such payment to be taken on account of commission should the work be at a future time carried out from the design submitted by him in competition and under his superintendence.

PETERBOROUGH CATHEDRAL.

THE preparations for the taking down of the central tower are nearly complete, and in the course of a day or two the work of removal will be commenced. The contractor is Mr. John Thompson, who has hired two steam-cranes in order that the stones may be removed with expedition as well as care. The Dean and Chapter have lost no time in taking precautions to prevent loss of life. On January 2 Mr. Pearson reported:—I yesterday again carefully examined the central tower, and with very great regret I have to report that the settlements are decidedly much more marked than when, a few months ago, I looked at them, and there are besides several new cracks being developed. It is perfectly evident, therefore, that the greater part of the tower is in more or less a state of movement, and, as it is impossible to say when or how this might be seriously accelerated, I would strongly advise that the services in the choir and those just outside the choir be discontinued. This may appear a strong measure to recommend, but, looking at the state of the tower, I feel that I should not be justified in doing otherwise. I further advise that very nearly the whole of the upper part of the tower be taken down, so as to relieve the arches of the crossing and the piers of as much weight as possible, and also to prevent the possibility of any of it giving way suddenly and cutting through the roofs to the floor below. The pulpit, organ, and screen had better be removed at once. The nave can easily be arranged so as to adapt it for the services, and the organ can be put up behind the temporary stalls.

On the same day a large body of workmen were employed to screen off the tower from the nave, and in making the necessary preparations for fitting up the western portion of the nave for Divine service. The fine organ standing on the screen, and the massive stone pulpit erected in memory of Dr. James, a former canon of the cathedral, from the designs of the late Mr. E. M. Barry, were both immediately under the central tower, and it was of the greatest importance to remove them before touching the tower. A telegram was sent to Messrs. Hill, the builders of the organ, and they lost no time in sending down some of their men to superintend its removal. This has now been safely effected, and it will be erected in the northern aisle of the nave. The family of the late Dr. James have generously offered to remove the pulpit at their own cost and to re-erect it hereafter, and this will be accomplished with as little delay as possible. Late on last Saturday night the preparation of the nave for Divine service was completed. This included screening off the entire nave as well as the aisles, to something like half the height of the nave from the floor; raising a double platform for the Communion table across the east end, the ascent to each stage being by three steps extending the whole width; the removal of the platform from the choir; the erection of a temporary pulpit, and arrangements for seating the congregation. Mr. Pearson states that the south-eastern pier of the tower shows singularly conflicting indications of failure. The pillar is depressed on the choir side at the triforium level to the extent of 3 inches, on the transept side to the extent of 6 inches, and at the clerestory level to the extent of 4½ inches, while the arches on both sides are distorted. The lantern stage of the tower is in a dangerous condition; there are large rents in the walls following up others which show themselves distinctly over the main arches. There are other fractures in almost every direction, and many large pieces of the stonework of the windows appear to be on the point of falling.

ELECTRIC LIGHTING OF MANSIONS.

AN account has been given by Mr. O. E. Coope, M.P., of the cost of lighting his new house in Essex. Berechurch Hall is (he says) about three miles from Colchester, and in the latter end of last spring I determined to go into the whole question of the best and cheapest method of illuminating it. I had in the first instance an estimate drawn up of the cost of laying down gas plant, which was simple enough; but when I came to that of the electric

light, many difficulties presented themselves. Not only was there the widest divergence as to cost in the tenders sent in, but I found that it would be necessary for me to be acquainted with the various kinds of light, the relative merits of the dynamo machines, the best kind of engine to drive them, whether accumulators should be employed, the manner in which the wires should be insulated, how they should be laid in the house, the precautions necessary to prevent risk of fire, &c.; for upon all these the permanent well-being of the installation appears to depend. I saw at once that it would be prudent as well as economical to employ professional assistance. I therefore engaged the services of Mr. Heaphy, C.E., of the Phoenix Fire Office, to advise me upon the matter and superintend the installation on my behalf. We examined together every different system of lighting, the result being that I determined to adopt the Swan incandescent light and the Burgin machine, and accepted the tender of Messrs. Crompton & Co. to supply the same, after I had instructed Mr. Heaphy to draw up a regular specification and contract going into every detail, and giving me the power of rejecting any work or materials he was not perfectly satisfied with. We arranged to have 200 lights of 18 candle-power each, and four dynamo machines; the engine to be a 12 horse-power, with very sensitive governor and with tubular boiler, all leads and wires to be heavily insulated in the best possible manner, and the insulation to be rendered non-inflammable inside the rooms. They were to be embedded in the walls and kept at least 4 inches apart from each other, and 4 inches from every kind of metallic substance. Every floor, every room, and, in many cases, each light to have switches to turn the current on and off, as well as a lead "cut out" to guard against over-heating of the wires.

The whole has been carried out as specified, and the result has been a success that has exceeded my expectations. The light is quite as easy to manage as gas, while the softness, the purity, and the agreeableness are such that a return to any other method of illumination would be now quite out of the question. The pictures, books, and decorations have no chance of injury; the ceilings and walls remain unsoiled, while the difference in health felt after sitting for an evening in a room electrically illuminated, and another lighted by gas, must be experienced before it can be appreciated.

I will now give details as to cost:—Estimate for gas plant, buildings, and erection, 740*l.*; gas main to house, 75*l.*; laying pipes in house, 200*l.*; cutting and making good again, 50*l.*; chandeliers and brackets, &c., 268*l.* 18*s.*—total, 1,333*l.* 18*s.* Cost of electric light:—Four dynamo machines, 405*l.*; 220 Swan lamps, 55*l.*; 200 sockets for same, 10*l.*; cable, wires, switches, and cut outs, 66*l.* 4*s.*; cutting and making good walls and floors and incidental work, 60*l.*; engine and boiler, extra flywheel and belting, 300*l.* 6*s.*; counter-shafting, 25*l.*; foundations to engine and flooring, 40*l.*; erection, laying wires, &c., and carriage, 90*l.*; buildings, 150*l.*; chandeliers and brackets, &c., 268*l.* 18*s.* Total, 1,470*l.* 8*s.*

The cost of the first outlay for electricity is, as will be seen, somewhat in excess of the same for gas; but then I have no nuisance of lime, or of tar, or other refuse products; no leakage of gas into the house, no smell in the manufacture, or damage to my garden; and, in the place of an unsightly gasometer, I have a compact little engine, placed out of view, and which, when not driving the dynamos, is utilised for pumping water to the top of the house, and can also be employed for sawing wood, or any other purpose of a like nature I may require.

I will now estimate the annual working expenses, and, in making a comparison, I will assume that it would cost the same to manufacture 1,000 cubic feet of gas at Berechurch as it does here. Electric light—200 18-candle lamps, each working 1,150 hours per annum. Coal at 20*s.* per ton, 38*l.* 10*s.* 1*d.*; engine-driver at 30*s.* per week, 78*l.*; renewal of lamps, 153 at 5*s.* each, 38*l.* 5*s.*; depreciation 10 per cent. on cost of machinery, 74*l.*; depreciation 5 per cent. on conductors, 4*l.* Total, 232*l.* 15*s.* 1*d.* Now, for less than half this amount of light it costs me 200*l.* a year here (*i.e.* at Rochetts, Brentwood), and therefore, I am, if anything, understating the expense when I say that, had I used gas at Berechurch giving an equivalent illuminating power, it would have cost me at least 400*l.* per annum to produce.

This would show an annual saving of 167*l.* 4*s.* 11*d.* to me by using electricity. Having had twenty years' experience of lighting this house by gas—which I consider a great improvement upon any previously known method—I am only too sensible of its drawbacks, and, although I am not doing away with it here yet, I am well satisfied that I have adopted electricity at Berechurch.

THE HISTORY OF THE NEWLANDS MILLS CHIMNEY.

ONE of the witnesses at the inquiry held by the coroner of Bradford relative to the deaths of the fifty-four persons by the fall of the chimney at the Newlands Mills was Mr. William Moulson, a member of the firm of Messrs. John Moulson & Sons, builders. He said that about the beginning of May, 1862, his firm had a contract with the late Sir H. W. Ripley and Mr. E. Ripley for the erection of a chimney at Newlands Mills. No plans or specifications were drawn up when the contract was taken, but before commencing the work he had some conversation with Sir

H. W. Ripley, and was asked to give a tender for a chimney 80 yards high, with a 9 feet flue, a base of 24 feet, two courses of footings, and a bed of concrete 2 feet thick at the foundation. The footings were to be 28 feet square and 12 inches thick for the first course, and 26 feet square and 12 inches thick for the second course, and the chimney was to be built in all respects like the chimney they had just completed at the Bowling Dyeworks. He was also requested to give an alternate tender for a chimney with a 10 feet flue, a 26 feet base, and a height of 80 yards. No written particulars were given to him, and he made out the tender before leaving the works at Bowling. He was instructed to go on with a chimney having a 9 feet flue, the amount of the tender being 942*l.* 5*s.* 10*d.*, exclusive of the coping, which he estimated at 40*l.* Sir Henry said that he would instruct his architect, the late Mr. Andrews, to make plans and have the ground laid out where the chimney was to stand. Subsequently some conversation took place about the foundations. Sir Henry Ripley suggested that five pits should be sunk to the coal workings—the better bed coal which at that point was usually 2 feet 6 inches thick. The centre pit was to be 9 feet in diameter, and each of the corner shafts 6 feet. Thomas Pitts was to be asked to give a tender for the sinking of the pits, and the packing was to be done by day work and material. He himself agreed with the suggestion that these were necessary steps. His uncle, the foreman of his firm and a practical man, assisted, he thought, at the deliberations. On May 22, 1862, the tender was obtained from Mr. Pitts, and immediately afterwards the site of the chimney was selected, in the presence of Sir H. W. Ripley; the architect, Mr. Andrews; and the clerk of works, Mr. Morforth. An indented portion of the ground being observed, it was uncovered, and an old shaft, apparently used for getting coal, was found. The shaft was 8 feet by 6 feet, and Sir Henry suggested that it should be used as the central pit. Mr. Andrews, Mr. Pitts, and himself considered that this would be safer if used for the centre pit than for the corner pits, and orders were at once given for opening the shaft and sinking to the bottom, before the other shafts were begun. Pitts would at that time be over 50 years of age, and he had not seen him for more than ten years. The shaft was opened. He did not go down, but his firm's foreman did, as Pitts worked under their direction, being paid at the rate of 8*s.* a yard for the old shaft, and 9*s.* 6*d.* a yard for the smaller shafts. The packing was extra, and cost 95*l.* 14*s.*, including the material. They then dug out, under his supervision, the foundations for the chimney, 30 feet by 14 feet. Four other shafts were sunk by Pitts, one at each corner of the site, each being 6 feet in diameter. The five shafts were afterwards filled with concrete, consisting of Skipton lime, broken stone, engine ashes, and sand, all blended together. The material was tipped into the shafts from a stage as hot as was practicable, each shaft being filled alternately. There was, he thought, no pounding or ramming of the concrete, which was nearly liquid, and almost levelled itself by the drop. Men were, however, sent down to level it. When the shafts were filled, a bed of concrete 2 feet 6 inches thick was placed over the whole area of the chimney's foundation, which was 30 feet square. Foundations were then placed upon the concrete, the first course being of sound rag stones, 28 feet square. The joints were made up with good lime mortar and levelled. A second course of similar footings, 12 inches thick, crossed the joints of the first course. The stones were faced and the joints filled up with mortar, bedded off and levelled. He did not think that Mr. Andrews was on the spot just before building was begun, but the clerk of the works was there daily, and had an opportunity of seeing the levelling. This was done by the men who had assisted at the foundations, Mr. Illingworth being the leading man. The clerk of the works, Mr. Morforth, was very particular, and used a spirit level. The same person expressed an opinion that both the fire and red brickwork agreed upon was too light for the chimney. They consulted about it, and he concurring in the opinion, Mr. Morforth decided to speak to Sir Henry Ripley on the subject. He advised that it should be built either with dressed insides instead of backing, or with solid red brick for the inside of the chimney. Sir Henry came on the same day, and had some conversation with Mr. Morforth, after which he was asked the difference in price between dressed insides and red brick for the hearting. The difference would be 4*s.* per cube yard. Sir Henry Ripley said that he did not think it necessary to dispense with the backing altogether. "Supposing," he added, "we were to increase the thickness of the brickwork to 18 inches halfway up the chimney, and then to diminish it to 14 inches for the remainder." Mr. Morforth replied, "I would rather have it the other way; but you, Mr. Ripley, have had a good deal of experience in chimney-building. I have had more experience in the building of brick chimneys, and do not understand so much of stone." He agreed with Sir Henry that the chimney would be strong enough with the alterations proposed. Thereupon it was decided that the erection should be proceeded with. Mr. Andrews was not present at that interview. There never was any specification of the chimney prepared, so far as he knew; nor was there any specification for any one of the four chimneys which his firm had built at Messrs. Ripley's dyeworks. The drawings did not show the character of the structure. He frequently saw Morforth there, and he did not hear him make any complaint

about the work. Plenty of material was always kept at the place. The erection of the chimney was begun on July 11, 1862, and the work was continued till December. The weather till then had been comparatively mild. From December the work was not proceeded with till February 28, 1863, in consequence of the state of the weather. During that time the top was wrapped up. The chimney was then a little more than 40 yards high. The panels and holes were not in the original design; but after the work had been begun and the erection had proceeded to the height of about ten yards, Sir H. W. Ripley desired to have some ornamentation, and designs from architects were obtained. Mr. Morforth ultimately brought a design showing holes and panels to the office at the works, and said it was to be followed. Both witness and his father objected to it, as they believed it would greatly weaken the chimney, and they told them that it would be better without them. Mr. Morforth said that Sir H. W. Ripley was very determined about having it ornamented. On the following day they saw Sir H. W. Ripley, and told him the chimney would be stronger without the panels; he smiled and said, "You will have to do it my way." The whole of the panels and holes were built as the erection proceeded; none of them were made afterwards. When the work was again begun, in February 1863, there were no indications of subsidence or weakness. The work was continued till June 8, on which morning Illingworth, after plumbing it, said the chimney had gone over a little. The attention of Morforth was called to it, and he went to see the architects. In the afternoon the late Mr. Andrews came to the place, Sir H. W. Ripley being also there. A number of men were immediately set to work in clearing the foundations. Sir H. W. Ripley, then gave instructions for the whole of the chimney to be examined and plumbed; and Mr. C. Woodcock and his assistants were engaged two days upon this work. He reported that there had been a slight settlement on the north-eastern side of the foundations. Morforth suggested that a man named Woodman, of Manchester, should be sent for to straighten the chimney. This was done, and Woodman, after examining it, said, "I can straighten the chimney and make it as strong as before." He pointed out how he could do it, saying that he had by the same means straightened many chimneys. He said he should cut right through the chimney on the opposite side, and put in half an inch thinner course. Sir H. W. Ripley agreed to his doing this, and arranged that witness's firm should provide him with labour and material with which to do the work. The operations were conducted under Woodman's direction, and he selected the point at which the cuttings were to be made. By the first cutting the chimney was brought back half a yard, plumbed from the top. Woodman was well satisfied with this, and said that by another cutting he would be able to make it straight. A second cutting was made about two feet above the first, which brought the chimney as nearly straight as possible. After the new masonry had been put in, it was discovered that two corners crushed down; and under Woodman's directions these were cut out and replaced with new stone. Their account for labour and material in connection with the straightening of the chimney amounted to 144*l.* 0*s.* 10½*d.*, which was paid by Messrs. Ripley. The work of erection was proceeded with, and the chimney was completed by the following November. During the progress of the work after the straightening there was no further subsidence. At that time he (witness) had had twenty years' experience in building operations, and had had to do with the erection of many chimneys. He could not account for the subsidence, except that it might be caused by quicker drying on the south side. About three years after the completion of the chimney they were employed to effect some repairs at it. Sir H. W. Ripley made the communication about it and was present when it was examined. The chimney was slightly cracked on the side opposite to that which had been cut. The cracks were on the north-east, east, and south-east sides. He then formed the opinion that the cracks were caused by the oscillation of the chimney at the point where the courses had been thinned. The portions of the outer shell which were bulging were taken out and replaced. The work occupied about seven weeks, and involved an outlay of 96*l.* 19*s.* 4*d.* The "hearting" was exposed by the removal of the outer shell and it appeared to be quite solid. No cracks remained in the chimney after these repairs were completed. There was no limit as to what was to be done to the chimney. The order of Sir H. W. Ripley was to repair the chimney thoroughly. It was done by day-work and charging for the material used. He did not know whether the interior of the chimney was examined; it was in use at the time. Since then he had not been called upon to execute any repairs to the chimney, nor had any member of his firm. He had noticed for some time that the chimney again leaned in the same direction; he first observed this five or six years since. He had noticed this when passing along Ripley Street. On December 13 last he observed that it was leaning more than it had done previously since the straightening. He had heard it was intended to repair it, and he went along Ripley Street purposely to look at it. The chimney was then leaning eastward. The operation of straightening would break a number of the through stones. It was through Mr. Horsfall, one of the tenants, that he heard that the chimney was to be repaired. Mr. Horsfall a week previous asked him to examine

the chimney and give a written report. He told Mr. Horsfall he could not do that unless he was requested to do so by Messrs. Ripley.

By Colonel Seddon: When the chimney had been partly built, Sir H. W. Ripley expressed a desire to carry it to a height of 100 yards; but after it had canted and Woodman had straightened it, orders were given to complete it as soon as possible, and the idea of making it 100 yards high was abandoned. As to the foundation, the wall of the old pit shaft was allowed to remain. The four shafts which were sunk appeared to have a firm surrounding of earth between them and the centre shaft. The weight of the chimney would be between four and five thousand tons. The concrete bed was quite hard before they began to build. No cramps were used in the foundation. He had known cases in which buildings had cracked in consequence of being upon old pit workings. He doubted whether the most careful packing of an old working would prevent the ground from giving way in some instances, even if the workings were at a depth of 40 yards. The old pit shaft was lined with dry wall stones. It did not appear to be coming away. All the filling was taken out previous to beginning the operation of packing, which was started from the centre shaft. Originally the two flues into the chimney were 5 feet 3 inches. It was afterwards decided by Sir H. W. Ripley to have them 6 feet 3 inches. At the commencement the work was being done without drawings; but when the drawings were prepared it was decided on the alteration. They had then got as far as the spring of the arch; and when the alteration was decided upon the work was pulled down again right through on that side. That was on the north-west, and also a portion of the west face and adjoining angles. The whole of the new work was properly stepped or tied in; and no one could see there had been any alterations. Mr. Morforth ordered the alterations to be made as soon as the plans were brought; and he acted upon instructions from the late Mr. Andrews, the architect. He did not know on whose authority Mr. Andrews acted in this matter. There were not more than two openings into the flues, about a foot square. The same quality of lime was used throughout the work. It was Skipton lime. Doncaster and South Embsall lime were better for mortar ground in a mortar mill. Both these kinds of lime were much used by builders in this district in 1863. They were not dearer than Skipton lime. He was not aware that the main flue at the base now measured 10 feet; if it did he should think it was the result of expansion by heat. He had never known an instance in which a 9-foot flue had been expanded by heat to 10 feet. He was not aware that the inside casing of the chimney had been altered since it was built. When the chimney was built there was a 3-inch cavity between the red brick and the fire brick; it was never intended to be a 6-inch cavity. That was carried out all round the chimney to the height of 30 feet. He suggested that brickwork or inside wall-stones should be used throughout the chimney instead of packing. Sir H. W. Ripley suggested the method which was adopted, and he agreed with his suggestion; but from his experience as a builder, he was of opinion that by using bricks or wall-stones, instead of packing, the chimney would have been much stronger. After what had occurred, he did not think that chimneys of that size should be built with packing. The weak point of such work was its evenness of character, and its being more likely to settle. The fire-brick lining was entirely independent of the common brick; there were no ties between them. The firebrick lining was finished off with red brick; there were some openings left, but the firebrick had to support the red brick above. There would be an opening on each face, about 3 inches square. These openings were two courses high, and half a brick in width. The firebrick was laid with every fourth course in headings, and he thought that would be stronger work than if all had been heading courses. The red bricks were laid in heading courses about every fifth course. The stone ties were built into the red brick to the extent of about four and a half inches, and ran about half-way to the packing; corresponding ties ran from the outer case and overlapped the ends. There was not a bed of throughs extending all round. There was a through at every yard in height, making a total of 560 throughs; but more than this number were put in. In building they did not impose any restriction as to the use of the throughs; where they would come in they were used. The photograph of the ruins (produced) did not show headers every fifth course; there were eleven courses shown in which he did not detect any stretchers; it appeared as if they had been broken. He did not think that eleven heading courses would be weak construction in a confined place like that. It was not the usual practice to build so; and it would be no saving in the cost. He attributed these eleven courses being put in to inability to obtain the circle bricks, which were supplied by Messrs. Pearson & Son, Mill Lane. It would have been better if stretching courses had been put in then. These heading courses were at the base of the chimney, and would have to carry the greatest weight. He believed the heat in the chimney would cause great expansion in the inner lining. In the present day it was the practice in erecting chimneys to leave the fire-brick free at the top for expansion, and also to allow a greater cavity, which in this instance was three inches. The greatest expansion would be below; and the red brick lining

resting upon the fire-brick lining would be liable to be raised; but he had not had any experience of that. He had known instances of chimneys being dislocated at the top, but he could not say whether it was due to a cause of that kind. He thought the force of the expansion would be upwards, and it must carry before it the lining resting upon it. The same effect might result from the sinking of the packing, which was composed of ordinary rubble and ordinary mortar. There was no foreman or clerk of works whose sole duty it was to watch the work done at the chimney, so that stones might be laid on edge without his knowledge, and too many heading courses might have been put in the brick lining. There would be no advantage to this firm or to the workmen in doing this. As to the straightening of the chimney by Woodman, he thought the effect of the cutting would be to throw the weight of the chimney on that side, and he formed the opinion that it had been rocking from that point. The weight of the chimney, to a great extent, after the straightening, would be concentrated on the opposite side of the foundations. That was on the side on which it had been cut. If the foundations were at all shaky, the tendency would be for the chimney to go on the other side; and if so it would bring the base of the structure straight again. In that case the top of the chimney would lean in the opposite way, through having been cut. The effect of the straightening process would be to injure the masonry on that side, by the tearing and breaking of the throughs, which would loosen the mortar. This effect would be more above the cut than below; but there would be some injury done to the structure below. The two cuts were about two feet apart.

EASEMENTS OF LIGHT.

THE following memoranda on the best way of dealing with ancient lights have been sent to the Institute Committee by Mr. John Holden, F.R.I.B.A.:

Memoranda on Easements of Light.

1. The main difficulty will be in dealing with those windows which have already gained their right to the title and advantages of ancient lights and so become entitled to the protection of the present law.
2. So far as the future is concerned, I see no reason why a short Act should not be passed cancelling altogether in future the application of prescription in connection with window lights, and making it absolutely necessary that a grant should be proved before any rights whatever should be accorded to windows over the lands of an adjoining owner. No injury would by this be done to the owners of property purchased within the nineteen years preceding the passing of this Act, as an easement of light obtained by lapse of time is a matter of profit for which no equivalent or consideration has been given, and to which the party is only entitled legally and not morally.
3. The local authorities should deal with buildings fronting new streets in the manner which many have already done, *i.e.* by limiting the height of new buildings to the width of the street, making practically an angle of 45°. This should be made a Government regulation.
4. A different course would be required in dealing with existing rights, but I think some limit should be placed on the continuance of these easements, especially when it is considered that in almost all cases the easement has originally been obtained through the ignorance, neglect, or neighbourly feeling of the owner of the servient property.
5. The owner of the dominant tenement should therefore be required, when called upon so to do, to prove the *beneficial user* of the window extending over a period of say ten years, otherwise his right to it should cease. This would do away with a large number of claims which are constantly being made in respect of windows and small lights not in use, and which have evidently been originally inserted for some special purpose long since disused and forgotten, or else simply with a view to obtaining an easement.
6. A special arrangement would be required to protect owners from suffering during the continuance of existing leases; but in all new leases the owner should protect himself against a tenant allowing an ancient window to go out of use.
7. The right of claiming for the prospective or future user of a window light should, I consider, be disallowed, and no evidence should be admitted beyond that of the previous user, upon which the decision should be based. The prospective user has lately become a powerful agent in influencing the decisions in these matters (*vide Aynsley v. Glover, Law Reports, 18, Eq. 544; Moore v. Hall, Law Times Reports, vol. 38, N.S., 419*).
8. The time during which a window may be closed up and not used (without its ancient character being lost) should be limited, and after that time has passed the ancient character should pass away. The term should be sufficiently long not to injuriously affect the temporary business arrangements of a tenant; and perhaps ten years would be a reasonable time.
9. In properties fronting to old streets no action should be allowed where the servient tenement is not raised in height above a line drawn at an angle of 45 degs. from the sill of the lowest

beneficially used window of the property opposite. In very few cases would any appreciable injury be done if this course were adopted. Beyond this stipulation, existing rights should be protected.

10. I think it would be advantageous if assessors—selected, say, from the Fellows of the Institute—were appointed in the different towns, who should decide judicially all questions in which the claims for damages did not exceed 250*l.*; and against these decisions there should be no appeal. A large number of these trifling cases now come before the Courts occupying considerable time, and the costs to both parties are very great, and quite out of proportion to the results. I believe that perfectly satisfactory decisions and arrangements could be given and made in the above manner and at a comparatively trifling cost.

11. When an injunction is asked for, or a money claim exceeding 250*l.* made, the ordinary Courts might be resorted to as now. But in all cases where a money claim is made before the ordinary Courts, and not before the assessors, and less than 250*l.* awarded, no costs should be allowed.

12. An injunction once granted by the Court should not be vacated by the parties by any private arrangement between themselves; such should only be done by the Court itself, which should decide whether any and what, if any, money payment should be made in lieu of the injunction. Any arrangement between the parties made in any other way should be absolutely void and should cancel the rights of the ancient window. The result of this would be to prevent parties from applying for an injunction, at which time they generally state that *the light is absolutely necessary*, and after obtaining it immediately commence to bargain with the owners of the servient tenement for a money payment, which in many cases is extorted. This is a most fruitful source of legalised perjury; and I think that if the above course were taken, very few injunctions would be applied for, excepting the ordinary interim ones to restrain until the hearing.

In the above memoranda I have endeavoured to indicate a course which would protect existing ancient lights if such were actually in use *beneficially*, and at the same time would tend to discourage and do away with such as were of little or no practical use, but which, being there, are looked upon by the owners as so much money sunk and invested, and which at some future time will be turned into a shower of gold. While the gaining of an easement of light over an adjoining property by lapse of time only is legally justifiable, still one cannot help the unpleasant feeling that it is a benefit which (excepting by the legal fiction of a grant which has been lost) has not in any way been paid for; and if such a method of gaining an advantage were applied to goods instead of real estate a very offensive term might, and in all probability would, be given to the transaction.

ARCHÆOLOGY.

The Jedburgh Pennons.—The two old pennons, which are said to have been taken at the battles of Bannockburn and Killiecrankie by the Jedburgh Burghers, had become so frail through age that it was found necessary to have them somewhat repaired, and this has been done with the greatest care. They have also been put into wooden frames with glass fronts to ensure their better preservation in future. These pennons were formerly kept with religious care by the Corporation of Weavers, but were handed over to the custody of the Jedburgh Museum at its institution in 1857. Sir Walter Scott always took great interest in "Old Bannockburn," as he used to call it, and got it lithographed by the late Mr. Lizars, Edinburgh, expressly for himself. It was carried by a deputation of Jedburgh men in the great procession at the laying of the foundation-stone of the Wallace monument at Stirling in 1861; and it was again publicly displayed when Her Majesty the Queen honoured Jedburgh with a visit in 1867. The Bannockburn pennon is of green silk, and the Killiecrankie one is of the same colour, but made of a sort of worsted.

TOWNS IMPROVEMENT.

Billingsgate Market.—Mr. Henry A. Isaacs, a member of the Court of Common Council, in a pamphlet entitled "The Trade and Traffic of the Ward of Billingsgate, and How to Facilitate Them," urges that the best, readiest, and most effectual remedy for the existing state of things is to be found in the acquisition of Nicholson's and Botolph Wharves, and the widening of Lower Thames Street from St. Mary-at-Hill to Fish Street Hill on its south side. The acquisition of the two wharves would enable the Corporation to extend the market accommodation and provide a lay-by for the vans and vehicles bringing railway-borne fish to the market. These vans are a continuous source of interruption to the traffic of the neighbourhood. The advantages thus urged could be provided at comparatively small cost. One portion of the ground floor of the wharf warehouses, which are in Thames Street, which adjoin the market, and which represent about one-third of the frontage of Lower Thames Street, between the market and Fish Street Hill,

could be utilised for widening the street. Another portion could be applied to the extension of the market, while a third portion would afford space for the much-needed market lay-by. The balance represented by the wharves proper with their river-side frontage, the most valuable portion, almost intact, and the warehouses, *minus* only the ground floor, except such portion as would be applied to widening the street, could be leased to the present occupants, and without any very serious loss to the Corporation. Any loss that would accrue would be in part recouped by a market-charge for waggons standing in the lay-by, such as is levied at Covent Garden and other metropolitan markets. Mr. Isaacs next contends that the widening of Lower Thames Street would be much more serviceable to the locality generally than to intersect the lanes by a new thoroughfare. Having regard to the importance of Thames Street in respect to its wharf traffic and its market traffic generally, it should no longer be allowed to remain with a roadway of only 17½ feet wide. Besides the enormous fish and dried fruit trades, nearly 40,000 packages of green fruit have been known to be received at, and the same number sent out from, the warehouses in Thames Street in one day. Given that Lower Thames Street were widened, as sooner or later it must be, the widening of Upper Thames Street, which is now in progress, would, when completed, give to the City of London another main thoroughfare. Such a thoroughfare would attract from the eastern wharves all the heavy traffic going westward by the Embankment or southward by Southwark Bridge, to the great relief of the eastern end of the City generally, and of Eastcheap, Fish Street Hill, King William Street, London Bridge, Cannon Street, and Fenchurch Street in particular. Mr. Isaacs expresses at some length the various objections to the alternative plan of forming a new street between Fish Street Hill and St. Mary-at-Hill, as proposed by Colonel Haywood, the engineer to the City Commission of Sewers, and concludes by urging that the widening of Lower Thames Street would be as full of local benefits as the intersecting street, which would cost 300,000*l.*, would be full of drawbacks and disadvantages.

ENGINEERING WORKS.

A Harbour for Dover.—Major-General Sir A. Clarke, Inspector-General of Fortifications, has communicated with the military authorities at Dover with reference to the construction of a convict prison at Dover. With the same communication Sir Andrew Clarke forwarded a copy of a letter from the Home Office, in which it is stated that the Government have finally decided to construct a national harbour at Dover, and that the work will be done by convict labour. Copies of the communication have been forwarded to the commanding officers of the Royal Engineers and the Royal Artillery, Colonel Gordon and Colonel Goodenough, respectively, who are asked to confer with the War Office officials as to the best site for barracks for the convicts. One of the places suggested for a site is the foreshore at East Cliff; another is the North Fall Meadow, at the back of the Castle; and the western heights are also spoken of. One of the objects which the officials are directed to guard against in recommending a site is that it shall not in any way interfere with the line of existing defences.

SANITARY WORKS.

Edinburgh Water Supply.—During last month the quantity of water sent into the city and district and places adjacent was on an average equal to 13,964,387 gallons per day, which represented 43 gallons per head per day to 324,800, the population supplied. The maximum quantity of water sent in on any one day was 17,535,000 gallons, which represented 50 gallons per head. This enormous quantity was due chiefly to deliberate waste and burst service pipes. During a great part of the month of December, but particularly during the storm, the vicious practice of leaving water apparatus constantly open prevailed over a large extent of the city and district, with the result that at least 5,704,000 gallons per day were wasted during the period of maximum supply, and about 1,600,000 gallons per day during the period of minimum supply. Indeed, in one district the pressure in the main pipes was so reduced as to prevent the water rising to the top cisterns in the houses, while, at the same time, the parties who were thus deliberately wasting the water were persistent complainers of having no water for the pressure boiler.

CHURCH BUILDING AND RESTORATION.

Edinburgh.—The new church for the congregation of West St. Giles', Edinburgh, has been opened. The style of the building is decorated Gothic, and a tower with spire above the north-east corner rises a height of 170 feet. The architects of the building are Messrs. Hardy and Wight.

Newton Heath.—The Church of St. Ann, lately erected, has been opened. The style of the church is Early English. The building consists of nave, north and south aisles, and chancel, with

vestries for minister and choir, and will accommodate over 600 worshippers. The seats throughout are of pitch pine. The roof is oak timbered. Mr. A. W. Smith, of Mosley Street, Manchester, is the architect, and Mr. Herd, of Ardwick, the contractor.

Hele.—The foundation-stone of a new church at Hele, in the parish of St. Mary Church, Torquay, has been laid. The architect is Mr. R. Medley Fulford, of Exeter, and Mr. F. Matthews, Babba-combe, is the builder. Accommodation for 200 persons will be provided. The edifice will be built in the Gothic style, of local lime stone and brick, with Hamhill dressings, and a tiled roof.

Oxford.—The erection of a new chapel and also of a separate house as a residence for the Medical Superintendent, both connected by a corridor with the main buildings of the asylum, obtained the approval of the several Bodies in Union, and has been confirmed by the sanction of the Secretary of State. The plans of the chapel and house, prepared from designs by Mr. H. J. Tollit, architect and county surveyor, were carefully revised by the Commissioners in Lunacy, and the Committees, after an investigation of the different tenders submitted to them, have entered into a contract with Mr. Charles Claridge, of Banbury, builder, for the erection of both buildings at the sum of 4,478*l*.

SCHOOL BUILDINGS.

Rubery.—New Board Schools have been opened at Rubery, King's Norton. The schools have been erected by Messrs. Horsley, builders, from the designs of Messrs. Martin & Chamberlain, and will accommodate 94 elder children and 66 infants—total 160. The schools and outbuildings cost 1,828*l*., and the teacher's house 457*l*., which, with cost of the land (200*l*.), architects' commission, &c., made the total cost of the schools 2,698*l*. 8*s*. 4*d*.

Stonehouse.—A Board School has been opened at Stonehouse, Devon. The building has been erected from the plans of Mr. J. H. Snell, architect, of Plymouth, by Messrs. Palk & Partridge, contractors. The school is for girls and infants, there being space on site for future extension for boys, if needed. On the ground floor there is a cloak-room, a large school-room, infants' room, two class-rooms, a mistress's room, an apartment in which the Board will in future hold its meetings, with a waiting-room and strong-room, and all the necessary lavatories and offices. Two spacious staircases lead to the upper floor, which is divided into a large school-room, two class-rooms in convenient proximity, a mistress's room, store-room, lavatories, &c. The fittings are by Messrs. Tremain & Son, of Plymouth.

Cinderford.—On Monday, January 8, the new Board Schools at Steam Mills, near Cinderford, erected for the Forest of Dean W. D. School Board, were formally opened. The buildings have been designed by Mr. Alfred Smith, architect, of Mitcheldean, to accommodate 417 children—boys, girls, and infants. They stand near the High Road, and are imposing in appearance; the style of architecture is Gothic of a plain but substantial type, the walls being constructed with grey Forest of Dean rubble stone with wrought dressings; the roofs are covered with blue slates. Each school is entered through a porch; and lavatory and all schools and class-rooms are large, lofty, well lighted, and well ventilated. The buildings are heated throughout with hot water, this work being completed in a very efficient manner by Mr. Leary, of Park Row, Bristol. The contractors were Messrs. Coleman Bros., of Chaxhill, near Gloucester, by whom the works have been carried out to the entire satisfaction of the architect and the Board, at a cost of 2,865*l*. Mr. William Jones has been clerk of works.

GENERAL.

The Royal Academy.—On Tuesday evening Mr. Benjamin W. Leader, landscape painter, Mr. Thomas Brock, sculptor, and Mr. Francis Holl, engraver, were elected Associates of the Royal Academy.

Mr. John Ruskin was on Tuesday unanimously elected to the Slade Professorship of Fine Art at Oxford, in succession to Mr. W. B. Richmond, who lately resigned the chair.

Mr. E. Burne Jones and **Mr. William Morris** have been elected Honorary Fellows of Exeter College, Oxford.

The Old Law Courts at Westminster are to be sold by public auction in lots, by Messrs. Horne & Eversfield, on Monday next, and following day. The lots offered comprise, among other things, about 1,000,000 sound bricks, timber roofs and floors, square floor boards, oak linings, partitionings, wainscotings, seatings, about 80 tons of lead, besides fixtures and fittings.

Herr Joseph Flüggen, the painter, has been appointed Professor of Costume to the Court Theatre, Munich.

Mr. Beresford-Hope, M.P., will on Monday evening preside at the annual distribution of prizes to the students of the school of the Royal Architectural Museum.

The "Gazette" announces the dissolution of partnership between Messrs. Gillett, Bland, & Co., of Croydon.

Dr. Bartlett has delivered a lecture on "The Invisible Dust in the Air we Breathe." He told his auditors that large quantities of poisonous white lead were spread by the attrition of painted surfaces. He strongly recommended the general adoption of Griffiths' Patent White, as manufactured by the Liverpool Sanitary Paint Co.

Messrs. W. E. Wilkinson & Co., of the Newcastle-on-Tyne Concrete Pavement Works, have opened a London office at 27 Great George Street, Westminster, S.W.

Messrs. Edward & Sons, of Glasgow, have completed the gold casket designed and made by them which is to contain the address presented to Lord Wolsley by the Corporation of London. The style adopted is Egyptian, and the design was selected in a competition in which the principal English goldsmiths took part.

A Town Hall is to be erected in Carlisle, N.B. A site has been offered in the High Street and a sum of 1,000*l*. has been promised by one subscriber.

The Pontefract Town Hall, erected from the designs of Messrs. Perkin & Bulmer, of Leeds, was opened on Wednesday. Messrs. Armitage & Hodgson, contractors, of Leeds, carried out the work.

A Large Laboratory is to be erected at the Dundee University College.

The Ayr School Board, out of four plans for the erection of a new school at Castlehead, have selected the plan with the motto "Omnia pro Bono," by Mr. Murdoch, conditionally that the estimates do not exceed 3,000*l*.

The Association of Master Painters in Scotland held the fifth annual meeting in Dundee on the 12th inst. Mr. Bennett, the chairman, suggested the expediency of having all apprentices bound by written indenture, of increasing the wages paid to them during the later years of their apprenticeship, and of encouraging and fostering their artistic talents by instituting a system of prizes for exhibits in the various departments of the trade. The next meeting is to be held in Edinburgh.

Overloading Floors.—About three hundred people collected in the upper room of a school in Hungerford on the 11th inst. to see the scholars play "Little Red Riding Hood." It was observed that the floor was becoming unsafe. The vicar requested the audience to leave at once. Scarcely had the last of the people cleared out of the room when the joists gave way, and the floor fell through into the room below.

Ventilation of Public Buildings.—Amongst the public buildings to which Messrs. R. Boyle & Son, of 64 Holborn Viaduct, have recently applied their system of ventilation may be mentioned King's College, London; Gaiety Theatre, Strand; Prince's Theatre, Manchester; and the Royal Aquarium, Yarmouth.

The New Hospital at Ayr, which was designed by Mr. Murdoch, has been completed, the total cost being 8,400*l*. The extras, exclusive of the alterations, caused by change of site, and additions ordered by the directors, only amount to 400*l*., or 5 per cent. over the estimated cost of 8,000*l*.

Strawberry Hill will be sold by auction early in the spring of this year, unless previously disposed of by private contract.

An Auction will be held in Edinburgh to-day (Saturday), when upwards of one hundred landscapes in oil and water-colours by Mr. John Smart, R.S.A., will be offered for sale.

Lancaster.—A farmhouse built of concrete, from designs by Mr. Geo. D. Oliver, of Carlisle and Workington, is now almost completed. The materials have been found by the proprietor, and the labour has been done by day-work.

Messrs. Perry & Co., of Bow, have been instructed by the London and South-Western Railway Company to complete all works which Messrs. Bull & Son had in hand for the Company.

The Newport Town Council have decided to make application to the Local Government Board to sanction the borrowing of 15,000*l*. beyond the 5,000*l*. authorised by the Improvement Act for the erection of the new Town Hall, which is to be erected from the designs of Mr. Lockwood and Mr. Lansdowne.

Scottish Society of Painters in Water Colours.—At the general meeting of the members of this Society Mr. Powell was re-elected president; Mr. McTaggart, R.S.A., vice-president; Dr. Blatherwick, treasurer; and Messrs. Young and Nisbet, auditors. Mr. Fairbairn was added to the Council. The report read by Mr. Smith, secretary, showed the satisfactory progress of the Society. The sales had risen steadily, and at the last exhibition in the Glasgow Fine Art Institute were over 1,100*l*.

Birmingham Architectural Association.—The third ordinary meeting of the Session was held on Tuesday evening last at Queen's College, the chair being occupied by Mr. W. H. Kendrick. Mr. Ralph Heaton was elected an honorary member, Mr. F. Turner an ordinary member, and one gentleman was nominated for membership. After the reading of a paper by Mr. Clere on "Surveying," a discussion followed, and a vote of thanks was accorded to Mr. Clere on the motion of Mr. A. Reading, seconded by Mr. J. R. James, and supported by Messrs. W. G. Mantle, Norman Gething, and the Hon. Secretary, F. H. Franklin Cross.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JANUARY 20, 1883.

TENDERS, ETC

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*** Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—
"Contract Supplement to THE ARCHITECT."*

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

LINDSAY'S

IMPROVED PATENT

REVERSIBLE TREADS AND LANDINGS

FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK
Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13, 14 & 15 SOUTH WHARF, W.

The Architect.

LONDON STREETS: SKY LINE.

PERHAPS there is no sight in the world that is more interesting in a certain sense to all comers than the aspect of the streets of London. It is not, as every one knows, that they are disposed exceptionally well, or even with ordinary grace; the contrary, indeed, must be acknowledged to be the fact. Neither does the sun confer upon

the scene that atmospheric glory which so often makes a landscape charming independently of the mere elements of form. The sunshine of the British metropolis is but sparingly bestowed in the intervals of cloudy weather, and it is much too frequently obscured by an all-pervading haze of exasperating smoke. The foliage of trees, although vastly more abundant in the summer time than the unobservant wayfarer would suppose, can seldom be called bright and gay. The carriage-ways are desperately dirty, and not even the footways creditably clean. The houses, last not least, are, in almost everybody's eyes, unsatisfactory; so very unsatisfactory, indeed, that in no other town that can be named are they considered to be worse, taking all circumstances into account, or even quite so bad. And yet it is these very houses that make London streets the interesting sight they are to visitors from all the world—provocative of their curiosity, that is to say, whether as thoughtful or as thoughtless people. Why have these houses such a shabby appearance, filled as they are with so many comforts and refinements? Why, collectively, are they still so shabby, representing as they do the very princedom of the globe? Why in their array are they still so shabby, in spite of all the artifices that the riches of a supreme nation can command? Is the character of the people here manifested, expressed, or illustrated in any way? What influence is it that makes London streets what they are; and what is to be their condition a hundred years hence? What makes the seat of such majestic Empire look so unworthy?

The chief interest attaching to these questions turns upon the hope of the present generation that a future one may see London very different from what it is. There is our river, for example. Our immediate forefathers had for their river quite another stream. It was Filthy Old Father Thames; and certainly it has been cleansed to a degree which they might reasonably have pronounced to be impossible. Not even the most incoherent of those pleasant newspaper critics who confer bad names so prettily upon all that belongs to their own people could venture now to call it anything worse than Comparatively Clean Old Father Thames, no longer disreputable at all, but very much indeed the reverse. And if the river, why not the air? It is the atmosphere that is the Dirty Old Element in London now; and the older it gets the dirtier it seems to grow. We hope seriously, nevertheless, to have a comparatively clean air some day—for the enjoyment of our grandchildren perhaps if all goes fairly well; and then, amongst many other sequences, what may the aspect of London streets possibly be?

The typical form of a London street—that is to say, of an average thoroughfare in a well-worn quarter of the town—may be described thus. Two parallel rows of flimsy-looking houses stare into each other's windows all along the line. Their walls are of coarse brickwork, so begrimed with soot that even weather-stain does not break the uniformity of tint. Their roofing, whatever it may be, is concealed behind a continuous breastwork, whose only object is this concealment of no one knows what. But above the summit there stand, in successive files, rows of chimney pots; and these are not concealed, but fearlessly exposed, in all the freedom of a reckless irregularity of both material and size, from which the stranger learns that the conditions of house-warming are so hopelessly confused as to make it no longer worth anyone's while to attempt to preserve appearances. Lastly, if the spectator should permit himself to look through some gap at the backs of these houses—a thing which actually seems to most people to raise a sort of question of delicacy—the utter abandonment

of all considerations of architectural decency is too striking to be explained.

The lower orders of London streets, it is needless to remark, cannot be any worse than this; but, strange to say, the upper orders are so little better that the superiority is scarcely worth mentioning. Portland cement, in permanent soot, may take the place of the sooty front of brickwork; and architectural features and proportions may be more or less developed for the sake of a little commendable display; but it is just as likely that the sky line may be worse as that it may be better, and the back view is sometimes still more flagrantly disrespectful to the observer. Even when it occasionally happens that a thoroughly good architectural composition in the highest class of material is achieved monumentally, the chances are that the dismal array of vulgar chimney-pots and imagination-harrowing tallboys and cowlis will still constitute the dreadful sky line, and that "the back side" of the building, as it used to be innocently called, is as much as ever a matter of total unconcern to the architect.

Now there are towns to be met with, of one character and another, where all these misadventures, or their equivalents, would somehow group themselves, by a kind of instinct of picturesqueness, into quaint effects of pleasantness and grace; every obstacle to the facile treatment of form becoming an incentive to the cheerful fancy of the people, not only to overcome difficulty, but to convert it into opportunity. In London, we are bound to say, nothing of this sort is ever by any chance discoverable. It may be the smoke that is at the bottom of it; the great metropolitan heart may be broken by it, and all hope abandoned. Permanent dirtiness is as near to permanent despair as anything can well be; and possibly, when the London atmosphere has been made, like the London river, tolerably clean, this may change the whole condition of things, striking at the root of the mischief. But even dirt may be picturesque, so that the question still comes up again. Clean-shaven and smug as our Royal Academicians may be to-day, the time is not so very far distant when their predecessors painted just as well, or possibly better, under conditions of even personal ablution which were altogether different. Why, then, may not our unwashed and unwashable London acquire out of its very uncleanness a picturesqueness of its own? We see dirty corners, not only in old-fashioned French and German towns, but in old Paris itself, and in "Auld Reekie" and other such places of our own, where the squalor of building becomes the joy of the artist, and a sky line, if no more, stands out against either bright azure or dull cloud, such as to delight the eye of gentle and simple alike. There is no such sky line in London, and this is its prime defect.

Of course it would be useless to call upon the respectable ratepayers of the metropolis to cultivate sky line. But let any critic of matters artistic tell us what can be done with a town of interminable extent in which there is no appreciation of sky line to begin with. Nothing at all can be done with it; and one of the chief grounds for expecting the architectural ensemble of London to improve in the course of the next two or three generations is the hope that, so soon as a somewhat clearer sky shall stimulate the public taste for pleasure out of doors, the Londoner may awaken to the misery of his everlasting contemplation of the sky lines which at present reign supreme in London streets. The time will come, in other words, when a man may be found looking at his own chimney-pots as if they were visible, and not, as he does now, making believe, even to his own conscience, not to see them. And we will go so far as to say that, even now, if such a body of men as a coroner's jury, after completing their work in that capacity, were to go out and "sit" seriously upon each other's chimney-pots, the verdict in every case would point clearly enough to temporary insanity. We invite the gentle reader to look at his own sky line for himself, and of course at those of his neighbours. It will not take long for him to see how shockingly unpleasant they are. It is because of their unpleasantness that he has got into a habit of not seeing them. No Londoner ever permits himself to look at the sky line as he walks along; he fixes his eyes generally on the pavement or the passers-by; but even when he studies the architecture below he ignores the tallboys and cowlis above. When he ceases to ignore them some day, he will have them altered.

London streets will probably always be streets of brick houses, and it is time that this were fairly taken into consideration with a view to the improvement of the material. We cannot deal with this question at present, but red-and-all-red

is not the way out of the difficulty, any more than Portland cement. It is a pleasure to see stone so increasingly employed; and the combination of various stones and bricks ought certainly not to be a neglected study, for it is capable of infinite refinement in London streets.

In the treatment of roofs the architect may probably find as much encouragement as in any other particular, in his endeavour to improve the street effects of London. The strong individualism of the English character may be accepted as a reason why our single houses will generally be always designed singly; and we need not observe that there is in this system of town architecture an element of interest which is of the greatest value. With individualised houses, therefore, we may obviously cultivate the individualisation of roofs. Never forgetting that a good sky line is the very best of all beginnings for the architect's composition, we may go so far as to assert that a line of houses separately treated, with their roofs especially varied and grouped, would be simply a basis of perfect art for the aspect of a London street. Here, as in all else, the architect, instead of allowing himself to fall into despair, would do well to take a wholly opposite view of his conditions, and the greater his difficulties the more will be his merit.

GUSTAVE DORÉ.

[BY A CORRESPONDENT.]

STATUESQUE, as though sculptured in marble, GUSTAVE DORÉ lies, literally covered by the rare flowers loving hands have laid upon his bier. By his death France has lost the artist who had the widest reputation. Last week in his *atelier*, 3 Rue Bayard, M. DUMAS fils and some friends were discussing the memorial of ALEXANDRE DUMAS, to which M. DORÉ's hand had put the finishing touch, when he said: "I shall not live much longer. After my death, justice will be done to me." Saturday morning he fell while crossing his bedroom. Angina pectoris had seized upon him, but on Monday there was a rally. His brother EMILE, a colonel of artillery, summoned by telegraph, was by his side. A second attack, brief in its agony, carried him off at midnight. Among the many who crowded to take a farewell view of him was one at whose house he had spent Friday evening, and who remarked that he had shown more of his wonted gaiety at that *soirée* than since the death of his mother last spring, which event had cast a dark shadow on his home. Madame DORÉ was a woman of remarkable energy. M. DORÉ père, a civil engineer at Bourg-en-Bresse (Alsace), had left her but small means wherewith to educate their three boys. With indomitable courage Madame DORÉ bent to the difficult task. "As to GUSTAVE," she was wont to relate, "his vocation was distinct. When two years old he would come to my bedside and seek for pencils and paper, and would remain still for hours." On one occasion, when between five and six, the boy was missed from his home. It was well known that he delighted in wandering among the woods which environ the neighbourhood, and even in clambering among the ruins of the châteaux with which Alsace abounds. His favourite haunts were searched in vain. "The boy talks in his sleep of St. ADÈLE," remarked his nurse. The hill thus named was several miles distant. At the summit thereof he was discovered watching the effect of a magnificent sunset, and unconscious that he had had no food since morning. "St. ADÈLE has fulfilled her promise," the child said; "she has enchanted me." GUSTAVE was twelve when his father died. He was then a student at the college of Strasburg, where he remained till his mother determined that he should finish his education at the College Rollin in Paris, and committed him to the charge of a relation who lived in Paris. His passion for art soon was made manifest. An under-master complained that M. DORÉ's copy-book was disfigured by drawings. "Show it to me," replied the rector. Instead of the French version of the passage in VIRGIL which was the lesson of the day, GUSTAVE had drawn a series of pen-and-ink illustrations, so admirably rendering the sense that the prize was adjudged to him, spite the irregularity of the proceeding. While yet at the Lycée Rollin, the boy determined to lighten the burden his education was to his mother. PHILIPPON was then the editor of *La Caricature*. To him he took some drawings. They were at once accepted; PHILIPPON discerned the future genius who had thus stumbled across his path. He paid regularly for as many as his studies admitted of GUSTAVE

DORÉ's executing, and proved a steady friend to the future artist. It was about this period that the death of Madame DORÉ's father put her in possession of a mansion, which had belonged to her family for above two hundred years, in the Rue Dominique St. Germain. GUSTAVE never forgot his mother's devotion to her son's best interests during the first years of struggle with adverse fortune. To his mother he devoted his life. It was she who did the honours of his *salon*, so hospitably thrown open twice a week to all the notabilities of Paris society. It was there, during the palmy days of the Second Empire, ALBONI would enchant the audience by a voice she refused to allow the public to hear. SAINT-SAËNS presided at the organ. GUSTAVE would take up a violin, and, without even music, accompany a tenor. On one occasion ROSSINI had consented to listen to an amateur performance of the overture to "Guillaume Tell." The artist who was to execute the violin part did not appear. GUSTAVE with his violin went through the whole overture without a libretto. His devotion to a friendship once formed was one of the salient points of his character. He was at Compiègne, an honoured guest of his imperial hosts, and one of a party gathered there for shooting, among which was an heir apparent, the ambassadors of Austria and of Italy, cabinet ministers, &c., when a telegram apprised DORÉ of the death of ROSSINI. He instantly quitted the château, and travelled to the house at Passy where lay the dead form of the great *maestro*. He sent home for canvas and painting materials, and remained for two days in presence of death for the purpose of executing the well-known portrait, so remarkable for the opposition of tones of white, which excited the admiration of *cognoscenti*, but which was never exhibited. In memory of her husband, GUSTAVE painted a fan for Madame ROSSINI, on which the first bars of "Guillaume Tell" were drawn, each note being represented by a cupid.

During the siege of Paris GUSTAVE DORÉ volunteered for duty on the ramparts, and went out with every sortie, until the committee of La Défense Nationale commissioned him to make plans and drawings of the works executed by order of Government for the internal defence of Paris. Bitterly he complained of the embargo thus laid on him. "Quel est mon devoir?" was the question put by him one night to a dying friend, as he came off duty in the trenches; not too weary, however, to amuse him by some story of other days, and cheer him by words of kindness. The dying man's only solace during those dark January days were DORÉ's visits. On one occasion GUSTAVE DORÉ found his friend's supply of wood exhausted—Government had requisitioned the wood stores of Paris. Straight from his friend's house he went to the Home Office, where his name proved an *open sesame*, and in an incredibly short time a supply arrived, to the amazement of the inhabitants of the house, to whom he had made no comment on the circumstance. His generosity was perfect. He accepted no thanks from its recipients. On one occasion the foreign editor of a work he had undertaken to illustrate, and who was scarcely known to him, asked him to lend him 400*l*. This GUSTAVE DORÉ did without hesitation, as also without repayment.

GUSTAVE DORÉ was at his studio in the Rue Bayard for the last time on Friday. The large studio has been sealed by order of the Procureur de la République. This is always done in France when the death takes place of a person who does not leave direct heirs. In the small studio is his last work. It is a vase some four feet in height, of singular beauty of form, executed in terra cotta of a pale red earth, decorated by satyrs, cupids intermingling with the foliage and fruit of the vine. The modelling of each of the figures was executed with tender care by his own hands: he lingered over this his final work with strange earnestness. The last directions he gave were with regard to the transfer of this vase to the exhibition at the Marltons, which will open next week. In this studio is the *Mask of Tragedy* for the decoration of ALEXANDRE DUMAS' monument. The clay is still moist; he gave the finishing touch to it on Friday. The last expression of his genius is the memorial to ALEXANDRE DUMAS. It stands eight mètres in height. DUMAS is represented seated in a chair; a book is on one knee, a pen in his right hand. The figure measures two and a half mètres.

The group immediately beneath the figure consists of a peasant woman reading from a volume open on her knees to her husband and to her son, who have returned from their daily toil in the fields to listen to the feats of "Les

Mousquetaires." The figures of D'ARTAGNAN and his companions are intended to decorate the other side of the pedestal. The names of DUMAS' works are to be inscribed on the two intervening façades of the base. This work GUSTAVE DORÉ had the satisfaction of leaving finished.

It must not be supposed that GUSTAVE DORÉ was appreciated by all his contemporaries. Some French artists were jealous of his success. It is true they admitted his marvellous power of draughtsmanship; they did not deny his poetic fancy, nay, even did justice to the immense resources of his imagination, but they denied his claim to be ranked as a painter. He illustrated books only, as he constantly said, in order to paint pictures, which he only sold when it pleased him so to do. Painting was his art; he lived by his pencil.

ROSSETTI'S WORKS AT THE BURLINGTON CLUB.

THE exhibition of DANTE GABRIEL ROSSETTI'S work which has been organised by the Burlington Fine Art Club (admission to which is as usual through the introduction of members) must not be taken as a rival of that at the Royal Academy, but rather as its complement. A good many warm friends and admirers of Mr. ROSSETTI are members of this Club, and they have not unnaturally been moved to gather together those pictures, studies, &c., to which they had especial means of access, or which had not been thought advisable for acceptance at the Academy, or, again, which the owners had not chosen to lend there, and to do this simultaneously with the Academy exhibition in order that the illustration of the painter might be as full and complete as possible.

The Club exhibition includes much that as a matter of course would not have come into the plan of the Academy's tribute to the deceased artist, such as many chalk studies for the pictures, many slight sketches, portraits of his family and of private friends in chalk and pencil, valuable not chiefly for art considerations, and so on. Also, quite a specialty of the Club gallery is the collection of water-colours, extending over nearly twenty years in date, including pictures of the pre-Raphaelite early phase, which certainly, in ROSSETTI'S case, do not answer to the epithets used by Mr. RUSKIN in his famous defence of the brotherhood:—

Pictures painted in a temper of resistance by exceedingly young men, of stubborn instincts and positive self-trust, and with little perception of beauty.

Sense of beauty there certainly is in ROSSETTI'S work. The arch-critic and master of eloquence stoutly defended the brethren against the charge of imitating early Italian schools, especially in their errors; but, whether the imitation were conscious or not, the manner of ROSSETTI, while he still signed himself "P. R. B.," was so closely an echo of early Italian modes, that one may at any rate say the artist looked at nature through his admiration of Italian art. Moreover, as the poet *par excellence* of the group, mediæval subjects had special charm for him, and the choice of types and costumes was no mere accident, but the natural drawing of his taste towards what was suggestive, dignified, splendid, and unlike the present "work-a-day" world. The literalism which stamped the pre-Raphaelite period of MILLAIS and HOLMAN HUNT, and which has weighted the thoughtful work of the last artist to its hurt up to the present time, in ROSSETTI led him chiefly to a rather fascinating candour in the treatment of subjects, and to a curious delight in the setting forth of beautiful objects and rich detail. He never seems to have had the unfortunate conviction, which appeared to sway some of the Brethren, that to show true worship for nature was to select her commonest themes and roughest workmanship for pictorial record. The group of water-colours and drawings, therefore, which belong to this pre-Raphaelite period of ROSSETTI'S career never disgust one by sordid types and assiduously-sought ungainliness or crude appositions of common colour. *Naïveté* of narration that makes one smile, very immature command of form, and a want of sense of sweet line, undoubtedly there are; but also are apparent poetic invention and aim and splendid colour. DANTE, SHAKESPEARE, legends of all kinds, ROBERT BROWNING, WILLIAM MORRIS, and W. BELL SCOTT furnished the painter with the chivalrous, emotional subject-matter that suited him. When he turned to the sacred story and designed the *Repent-*

ance of the Magdalen—vide a very striking pen-and-ink drawing belonging to Colonel GILLUM, of which the Club shows a photograph, and the oil picture lent by Mr. KEIR—he conceived it in the spirit of a mediæval romance; gives the revellers in the street, turns the supernatural gaze of the CHRIST through a window of the lit house upon the woman as she is pulled back from the entry by her gay companions, and fills the picture with tumult and strong contrasts. The technique of these early water-colours by ROSSETTI is very curious; he attained a kind of dry splendour in the colour without any of the transparent luminosity of the medium, lapis blue, brilliant greens, purples inclining towards the crimson shade, fine reds and orange and gold are on his palette. Of atmosphere in his water-colours there is little or none; the flesh painting is often very bad in tint; the lines, as we have said, are very seldom gracious. An exception is the lovely little figure of a girl kneeling and putting green sleeves round a helmet, called *My Lady Green Sleeves*, lent by Rev. E. HALE. Mr. RUSKIN lends a charming study of golden shades, echoing in colour the title given to the lady of the tale, *Golden Water*. It is known that the painter cared very little what he used in the way of pigment, so long as he got the effect he wanted; powder, cheap paints, anything might serve his purpose. Perhaps this is significant of a certain indifference to the technicalities of what one may call the alphabet of his art; as a bad speller may compose eloquent paragraphs, a poetic designer and rare colourist may paint a picture full of defective manipulation. The later water-colours are painted with a gummy medium, and forced up to look as much like oil as possible. Indeed, the two methods appear to be mixed. There are certainly touches in *La Bionda del Balcone* and other professed water-colours that look like streaks of oil paint. A chief lender of early water-colour drawings, it is interesting to note, is Mr. GEORGE BOYCE, the artist; Mr. RAE, of Liverpool, whose collection of ROSSETTI'S is famous, sends a few; Mr. STEPHENS, once P.R.B., a few; also Mr. GRAHAM, Mr. LEATHART, Mr. ANDERSON ROSE, &c., &c.

When we consider that imaginative conception is a distinctive attribute of ROSSETTI'S art, the fact becomes more remarkable that over the two collections of his works now open there is *comparatively* so little variety of theme. In the Burlington Club we find not only black-and-white studies for the completed oil pictures, but various versions—another *Dante's Dream*; two versions of the *Blessed Damsel*; another *Beata Beatrix*; another *Bocca Baciata*, under a fresh title; another *Proserpina*, large scale, and a smaller one; besides finished chalk studies and water-colour studies of these and other repeated designs, in which variations were experimentally worked out. Rich as the fancy of the poet-painter was, he seems to have been haunted by certain subjects, just as he was haunted by certain types; and although he was a mannered artist, his manner has more variety than his themes.

We have in a previous paper commented on the supremely artistic quality of ROSSETTI'S work in crayons. The Club has been fortunate in getting together some fine examples—the large mystic *Sibylla Palmifera*, in mixed red and black; *Ligeia Siren*, which is an especially significant and firm design, having that reminiscence of MICHAEL ANGELO about it which often breaks through ROSSETTI'S manner; the two studies for *Venus Verticordia*, in red chalk; and, hung in the writing-room of the Club, two studies of the lady of *The Blue Bower*, in pencil and black chalk; in the same mode, *Study of a Negro Boy for "The Beloved" Picture*, and another *Study of a Head*, looking down, in red chalk (numbered 136). There is a delicate firmness about these drawings which is, in workmanship, far finer than the often incomplete technique of the oil and water-colour pictures.

The most important completed oils in the Club are:—Mr. GRAHAM'S version of *Dante's Dream* with predella, and his *Fleurs de Marie*; *Lady Lilith* and the *Sea Spell*, lent by Mr. FREDERICK LEYLAND, and the portrait of *Mrs. Morris*, lent by Mr. MORRIS. The *Dante's Dream* differs little in the main arrangement from the Liverpool picture. There is less space above the canopy of the couch, where the angels ascend, and the side openings are somewhat differently treated. The predella, which shows DANTE asleep, watched by his kinswoman and ladies on one side, and DANTE relating his dream on the other, is especially rich in deep and varied colour, and poetically conceived but imperfectly painted, the hands rudely blocked out, and the whole too painty. The effect of retouching when the artist was not in his best strength makes

itself felt. The predella subjects show a kinship with the manner of Mr. BURNE JONES, a certain angular grace in the attitudes, an intensity of significance, and the mode of converging the curve lines of design. The main picture is certainly less beautiful in arrangement than the early study for it of 1855, where the city towers and river are seen gleaming above and below the spirals of the staircase, and wherein the figure of BEATRICE lies back upon the couch instead of being stilted forward by cushions, in a position of neither rest nor death. The colour scheme was changed also: LOVE in the water-colour is robed in azure, and DANTE wears a long gown of sad purple, with red sleeves; whereas in the oil picture LOVE is draped in scarlet and DANTE in unrelieved ashy purple.

The *Fleurs de Marie*, sometimes called *The Gardener's Daughter*, though it lacks the imaginative fire of other designs, is more nearly right as a whole, albeit dating as late as 1874. It represents a fresh, dark-eyed girl, three-quarter length, dressed in a grey blue gown with olive green pinafore, and black hood on the head, raising her partly bare arms to place a blue vase full of marsh marigolds on a carved mantel. The background of golden brown leather throws up the figure and dark full colour of the drapery. This picture, though a little heavy and rather black in shadows, is exceedingly fine in colour, sound in execution, and really gracious in the treatment of form. On the opposite wall is the portrait of Mrs. MORRIS, dated 1868. This is on the whole a finer picture, in spite of the ugly treatment of the thin hands. There is a grandeur in the blocking out of the head, with its heavy crown of dark hair and dreamy eyes, set upon the long throat, which here is hardly exaggerated; and the figure is perfectly easy in pose, and has some substance within the many-folded sapphire-blue gown. A loose green girdle, and a reddish blossom tucked into it, relieve the deep blue; on the table, covered with a dull orange cloth, is a vase of white roses behind, a shadowed crimson drapery, inclining to purple rather than red, is festooned. This scheme of colour is noble as it is uncommon, and the whole picture has large and distinctive style.

Mr. LEYLAND's pictures are not in a good period as to workmanship, but they are very rich in design, having that sumptuous abundance of material of which we have spoken before. The siren of the *Sea Spell*, in white drapery with greenish shadows, is crowned with roses, surrounded by apple-blossom and leaf, overshadowed by the pinions of a sea-bird; glimpses of sea fill in the background about her hair, that is tangled in the apple-boughs, and her fingers touch the strings of a lute. The picture carries one away by its poetic suggestiveness, and there are lovely passages in it; yet neither as a whole, nor in many parts, is it satisfactory. *Lady Lilith* again—a phantastical personage, who seems to represent the seductiveness of women; a kind of demon of the Hebrew legend, who was wife to ADAM before EVE was created, and remains in eternal youth to tempt mankind—has strong faults, ugly drawing of throat and bust, a heaviness and blackness in shadows, an opacity here and there; in the treatment of the hair, for instance. But colour is skilfully ordered, and broadly, the design is fine wherein this strange female creature in whitish raiment and white fur, on a couch draped with purple, starred with peacock's eyes, combs out her waves of ruddy hair. Behind a kind of toilet table a round mirror reflects the summer trees. The hands in this picture are beautifully drawn; it is curious how sensitively ROSSETTI could draw hands, though he often left them rudely modelled, still oftener ugly; as throughout his art work, in this point also he was uncertain.

We have already dwelt at more than our usual length upon the phenomenal artistic traits of this painter of our own century, and must now come to a conclusion. As before noted, between those who blindly worship the artist's peculiar genius, and those who quite as blindly depreciate and dislike, it is well to struggle for a sound judgment. We can only repeat that to our thinking here is a man of exceptional but fitful power, in whom the poetic element, while it inspired the artistic energy, often overcharged and bewildered it; who never brought to bear upon his craft sufficient persistent labour or sound study to render himself master of it as a complete means of expression, and who allowed himself to drift into serious faults of style and even vulgarisms. On the other hand, we must recognise in him great gifts, a keen sense of the strength and beauty of colour, a passionate imagination, a sincere purpose, and a style which at least sought, if it did not always attain, true dignity.

PARIS NOTES.

IT may be remembered that some short time back the French Government authorised the issue of tickets in a grand lottery for the purpose of enabling the Union Centrale des Arts Décoratifs to raise the sum of 14 million francs, required for the erection of a Museum of Decorative Art, to be organised after the plan of the South Kensington. These tickets are found to be selling quickly, and the success of the lottery is henceforth assured. In connection with the new Museum, it is now further proposed to erect a branch building on the Boulevard Richard Lenoir, at a cost of 600,000 francs. The Council of the Union Centrale have applied to the Municipality for the concession of a site on the Boulevard on the ground there belonging to the City, and have deposited plans by M. Dutert for approval by the Town Council. The execution of this project would establish in the very heart of the manufacturing quarter a library, lecture-rooms, collections of models, &c., which could not fail to prove of the greatest possible service to the various industries there carried on.

Several architects, commissioned by the King of Bavaria, have lately arrived in Versailles for the purpose of taking the most minute plans and drawings of both the exterior and interior of the celebrated Château. It appears that King Louis, a great admirer of Louis XIV. and his time, is now engaged in constructing on an island in the Chiemsee, a lake of Upper Bavaria, an exact reproduction of the Versailles Palace.

Messrs. Picard, Lapeyre, and Dechassaux, contractors for the demolition, or, to speak more correctly, purchasers of the Tuileries ruins, have lately become the recipients of an immense number of letters offering to purchase fragments of the building. The greater part of this correspondence is foreign, Great Britain alone furnishing more than a moiety. The Grand Duke Constantine of Russia has already secured the four or five iron brackets in the Salle des Marechaux, formerly used as torch-holders. They are black, twisted out of shape, and the gilding is all gone; but they were the only fittings in that great Hall that survived the ordeal of the Communist fires. A white marble chimney-piece has been purchased by the Count Potocki, while for the dial-plate of the great clock, would-be purchasers are so many that it will probably have to be put up for auction, together with some other fragments in almost equal request. So great, indeed, is the demand, that some Paris papers assert that, were they so minded, the contractors might sell the whole of the ruins, stone by stone, fragment by fragment, as relics and keepsakes, at prices relatively very high.

By a decree of the Prefect of the Seine issued last year it was rendered obligatory upon proprietors to maintain the fronts of their houses in a clean and presentable state, and to have them scraped, painted, and coloured (as required) at least once in every ten years, under penalty of prosecution and fine. In accordance with this new regulation, all proprietors of houses in the 5th and 6th arrondissements, and also of buildings which, though situated in neighbouring arrondissements, yet face streets one side of which lies in the 5th or 6th arrondissements, have been served with notice to cleanse the façades of their houses before October 1 next.

Arrangements are being made for the reception and disposal in the Louvre of the objects bought for France at the Hamilton sale. These works of art are not yet legally the property of the French Government, the sum of 20,000*l.* demanded for the purpose by M. Jules Ferry in July last not having yet been voted by the Senate, and a private individual having purchased them as an intermediary. The credit will, however, be passed by the Upper Chamber in the course of next week, and these treasures of French art and history find a fitting resting-place in the national collection.

At the last sitting of the Commission of Historic Monuments, the President, M. Antonin Proust, was able to announce that the sub-committee charged with the supervision of the Trocadéro Museum had completed the manuscript catalogue of the collection of comparative sculpture, which would shortly be delivered to the public. Up to the present time 400,000*fr.* have been spent on this collection out of the ordinary credit voted yearly for the maintenance of ancient monuments, and as it has become exceedingly popular both with visitors and students, it has been decided to inscribe a special grant in next year's budget in order to complete it as speedily as possible.

M. François Lenorinant, member of the Institute, has opened his yearly course of archaeological lectures at the Bibliothèque Nationale. The professor is continuing this year the history of ceramics, and especially of the painted vases among the old Greeks and Italians.

The annual exhibition of paintings in the Rue Volney is now open. Amongst the most remarkable canvases on view may be mentioned: Portrait of a lady, by M. Machard; a landscape in early morning, by M. Roll; two portraits of ladies, by M. Henner; a little girl astride the back of an armchair, by M. Baudry; *Vaches sur la Palaise*, by M. Leon Barillot; a village scene, by M. Cazin; the portrait of a young girl, by M. Jules Lefebvre; the *Pont des Arts*, by M. Jean Berand; a street in Venice, by M. Burger; a barber, by M. Tondouze, &c., &c.

The jury of the Ecole des Beaux-Arts in the competition for a sculptural model of *Hippocrates Healing the Sick*, have awarded 3rd medals to MM. Demay, pupil of M. Cavelier, and Delbrouch, pupil of MM. Dumont and Bonnasseux. In the competition for a figure modelled from nature, M. Capellaro, pupil of MM. Dumont and Bonnasseux, secured a 2nd medal; and MM. Lefebvre and Ganquie, 3rd medals.

At the last sitting of the Académie des Beaux-Arts, M. du Sommerard read a paper on the life and work of M. Charles Blanc, his predecessor in the seat he now occupies. The Académie afterwards elected the assistant members of the jury in the painting and sculpture sections of the Prix de Rome Competitions as follows:—*Painting Section*—MM. Emile Levy, Connon, Cot, Machard, Giacometti, Oliver Merson, and J. P. Laurens. *Sculpture Section*—MM. Fremiet, Allasseur, Momghlier, and Mercié.

A judgment has been delivered lately by the Paris Court of Appeal, which deals a heavy blow at the system of picketing and threats so often used by the French Trades Unions. The sentence of the Court below, condemning eleven working joiners to a fortnight's imprisonment and 1,000 francs fine each, for having placed Messrs. Patrice's shop *à l'index*, for employing threats to prevent men from working therein, and for establishing pickets near the premises, has been confirmed, and a precedent thus created which establishes the illegality of many of the methods of warfare made use of by the Trades Unions in their struggle with Capital.

The Fine Arts Administration is erecting an enormous wooden shed, with asphalt floor, covering no less than 500 square mètres, in the court-yard of the Tuileries. This building is intended to receive the columns, capitals, cornices, and other fragments, the choice of which, in terms of the contract for removing the Palace ruins, is reserved to the State. As the work of demolition advances the architectural treasures thus preserved will be numbered and registered previous to being deposited in the shed, where they will remain until their artistic or historical importance has been considered.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fifth ordinary meeting of the Institute was held on Monday evening, Mr. Horace Jones, President, in the chair.

The SECRETARY said he regretted to announce that Mr. William Simpson had left England in order to attend the silver wedding at Berlin; and though the ceremony, as they knew, had been postponed, it did not allow of Mr. Simpson attending to read his paper. The Secretary then read the paper, of which the following is a summary:—

Architecture of the Himalayas, with Notes upon some Thibetan Buildings.

Mr. SIMPSON, F.R.G.S., Hon. Associate, at the opening of his paper, called attention to the large geographical extent of the Himalayas. The country was little known, being most of it as yet unexplored, and still less had been done as regarded any knowledge of the architecture of this wide field. His paper would touch on a limited part of the architecture, as he proposed to confine himself chiefly to that of the Sutlej Valley. The paper would be somewhat fragmentary, but he considered the remarks, taken in connection with other Indian forms of architecture, would have a practical interest. It was now over twenty years since he visited the Himalayas, and he regretted he had not written the paper at a time when everything was fresh in his mind, and he could have spoken with more certainty. Architecture was not, however, the primary object of his visit, for he went in search of the splendid scenery of those regions. But as he had spent two summers there—those of 1860 and 1861—he had made numerous sketches (these were exhibited in the rooms), which were carefully enough done to

supply any defects of memory. In 1862 he returned to England by Cashmere, on the architecture of which country, as he reminded the Institute, he read a paper before it in that year; and two or three years ago he had given them an account of the Buddhist architecture of the Valley of Jellalabad. He thought the Himalaya buildings were originally wholly of wood. The extensive forests of *cedrus deodarus* to be found there still might explain this, a supposition further supported by the primeval wooden architecture of the Indian plains. The workmen who built these simple wooden structures seemed to have had no other tool than a kind of adze with which they fitted all parts of the building together. In the parts of the Himalayas which he visited, stone, which of course was easily procured in a hilly country, was used in combination with timber, but the structures he saw were of no antiquity, and were undated. From the Sutlej to the Ganges both materials were used for most of the better class of houses, and even for the very poor ones, reminding one of the old English combination of wood and brick as at Chester. But in the Himalayas, the wood was always laid horizontally, and never perpendicularly or diagonally, as in the English examples. In the well-built houses the wood was very carefully arranged, the beams being a foot or so in depth, extending the whole length of the wall—a beam on the outside and another on the inside, the space between being filled up with stone—the wall at right angles having its beams laid on the two just mentioned, on which again rested the next set of beams of the first-mentioned wall, and thus they went on alternately. In one house which he saw building the ends of these beams were slightly let into each other, so as to hold them in their places, and in addition small pieces of wood were dovetailed in between each pair of beams to prevent their bulging out through the pressure of the stones. From this description it would be understood that the mass of woodwork was capable of holding together of itself without the stones, which were filled in between, to make it a solid wall. On the top of this combination of wood and stone stood the real dwelling, which was altogether of wood. By means of beams it overhung the more solid structure beneath. The style was illustrated by a drawing of Bussahir Rajah's palace at Serhan, of which a detailed account was given. The woodwork of the upper storey was a mass of frames filled up with planks. Verandahs were not uncommon in the upper storey. The roofs of the palace were all pointed. Flat roofs were sometimes formed, and were of wood. In the region that came under the monsoon this roof would be particularly uncomfortable, were it not for being covered with sheets of birch bark, which again was covered with earth. The villages being unfortified, Mr. Simpson considered that the temples and palaces were built with an eye to defence, and this was shown by the stronger construction of the lower storey, which, if only of wood, could easily have been battered down. The doors were generally small, and, as far as he remembered, were not the usual mode of entrance, access being gained to the building higher up by means of a ladder. At present cattle were housed in the lower part of the buildings, and ample room also reserved for storing grain. Mr. Simpson drew a comparison between the palace at Serhan, still occupied in 1860, and buildings dating from the reign of Asoka B.C. 250, which are figured on the gateway of the Sanchi Tope, in Central India. In spite of differences in detail, the points of resemblance between the two Indian styles, parted by twenty-one centuries in time and by half the length of the vast peninsula in space, were found very striking. In both cases there was a lower storey of considerable height; in both the windows were very small in size and very few in number. The lower part of these houses dating from Asoka might, Mr. Simpson said, have been of stone; but he was inclined to think it was generally of *cucha*, or sun-dried brick. There was nothing to show it to have been of wood. Above this storey came the part of the house in which it was plain from the sculptures Asoka's people lived. It overhung the lower part, and was wholly of wood. In general this upper storey was very like the Himalayan examples. But when they compared the details, there was considerable difference in the forms, the most marked being the circular roof, instead of the pointed, as at Serhan and elsewhere in the Himalayas. Still, while recognising these dissimilarities, we had in the Himalayan houses the nearest approach among the present styles of Indian building to that practised in Asoka's time. In the Dravidian architecture of Southern India most of the details could be traced back to the same old Buddhist period, but not only had the style been changed, but the construction was altogether different, so that the general result had no resemblance. There was every reason to believe that from Cape Comorin to the Indus, and most likely beyond that river, the houses 2,000 years ago were all built much as represented in the sculptures at Sanchi and elsewhere. This mode of erection had long ceased to be practised, and the houses now to be seen in the plains bore no likeness to those of the past. The Himalayas had not been so liable to the effects of conquest, and that was why so many things were left unchanged, the architecture amongst them.

The author of the paper next discussed the question as to what led to the geographical separation of the two forms of roof, comparing forms found in Cashmere, Nepaul, and in China, but without arriving at any definite conclusion. He described the circular

roof as formed of ribs with planks laid on them. A section cut out of a ship would give a good idea of them. In Nepaul a number of roofs were placed one over the other, reminding the observer of a Chinese pagoda. He instanced a mosque constructed of timber as showing that the roof of the Himalayas was practised in Cashmere, and mentioned examples where the trefoil appeared, and lines which suggested a Gothic origin. Fergusson dated the Cashmere temples from 600 to 1200 A.D.; this was the only evidence as to date that he was aware of, but it showed that the roof of the Himalayas existed contemporaneously with the round form of the Buddhist period. He could easily accept the antiquity of the types peculiar to the Himalaya villages, and he was much impressed with the marked primitiveness of all he saw there. Their religious ceremonies bore a stronger likeness to those of Palestine in King David's time than to anything found in India. Every village had its khuda, or god, which was carried about on men's shoulders with staves exactly like the Ark of the Covenant. It was on a framework of wood which was covered with pieces of bright cloth with, in addition, a mass of yak tails dyed a deep red colour. On festival days the villagers danced round these objects of worship as the Hebrew king did round the ark. He had seen kids sacrificed to them, with rites similar to what is described in the Book of Exodus, chap. xxix., verses 12, 19 and 20. Fruit and flowers were also presented to them. Some of these gods were intended to represent Hindoo deities, but in what particular respect the author could not say, for they bore no likeness to them. Neither were the people Buddhists; they had no Brahma, no caste, or the like. The temple was merely a house in which the khuda dwelt, and was generally situated in the middle of the village. He had seen some temples which were away from the villages, in sacred groves of the deodar, these trees being never cut down save to repair the temples, reminding one of the cedars of Lebanon, which to this hour are held holy from their having been used in the building of Solomon's temple, the link of association being all the more noteworthy owing to the fact that the *cedrus Libanus* and the *cedrus deodarus* belong to the same botanical genus. He was sorry that he had not made plans of these temples, but he had not cared to shock the prejudices of the natives by forcing his way into them.

Mr. Simpson gave some description of the temple at Chini and of those at Chergaon and Jacko. Most of the Hill temples were elaborately carved, and one of his sketches represented a porch and other details of the Chini temple. There was a drawing showing how in some cases the wood beams mixed with the stonework were frequently decorated, the design on each beam being varied. The carving on these temples was always striking, for though rude it was generally bold and artistic. In front of the Chini temple stood a picturesque structure called a Dharamsalah, a word meaning rest-house. Each village had one, and they were placed in front of the temples. Travellers used them for resting in, as they were the only hotels in those parts of the world; but they were also used for ceremonies, for the devi, or god, was sometimes brought out and placed there. The Dharamsalah stood on a rudely-paved circular space, resembling one of the village threshing-floors. At one of the Chini festivals the devi was brought out and carried round the Dharamsalah. A rude kind of music was kept up with long horns and drums. The men and women, holding each other by the arms entwined behind their backs, and singing all the time, swayed backwards and forwards, as if salaaming the devi. Thus they went round in a ceremonial dance, followed by the devi borne on the shoulders of two men, with others near it as attendants. Between the dances the devi was placed in the Dharamsalah. At the temple in the woods near Chini there was a Dharamsalah in which the devi was placed when the blood, fruit, and other offerings were presented to it. Mr. Simpson said he had been silent as to the many forms of Himalayan architecture copied from the plains, his object having been to describe those features peculiar to the hills. But he must make one exception as to temples with sikras—that was to say, the curvilinear towers of steeples, so common in Hindoo temples of the Himalayan types, of which he gave some account. He spoke also of the temple at Gangootree, sacred to the Gunga-jee, in the respectful manner of referring to the Ganges, represented there by a female and a crocodile.

Mr. Simpson concluded with a note on Thibetan architecture, and also on the Himalayan bridges. From one or two small fragments of monastery walls in Jellalabad he drew the conclusion—inferred by him in the paper he read three years before—that the walls of these buildings had a slope inwards. This, as an architectural influence, could be traced over a vast area, and he believed it extended even into Afghanistan. It was found in some of the oldest of the Buddhist caves, another remarkable instance of it being that of a tomb near Delhi. Captain Gill, in his book on "The River of Golden Sand," illustrated the houses of the locality, which possessed this very feature. Thibet was a rainless country, the rainfall being as seldom there as in Egypt. Snow sometimes fell, but only on the mountain peaks. It was not a sylvan country, and stone or sun-dried bricks were the materials employed for building. Among the noticeable characteristics, one object kept in view had been defensive purposes. Mr. Simpson noticed that a knowledge of the arch existed, and showed how the

lintel had been developed by projecting one tier above another, by which process the dentils of classic architecture were produced.

In describing the Himalayan bridges, Mr. Simpson said the construction was in each case the result of the materials to be found in the different localities. In the Darjeeling part of the Himalayas, where the bamboo was plentiful, that was the material employed; in Thibet, where wood was scarce, bushes twisted into ropes were used, one rope forming the footway and the other the handrail. In the Sutlej Valley a favourite kind of bridge was a single rope made of the hair of the yak or wild cow of the Himalayas. Here the passenger was tied to a forked pole, and pulled across by an independent rope, a mode of transit neither dignified nor safe, with the certainty that if the rope broke, death was inevitable. Bridges of more substantial construction were also described. In those regions, as elsewhere, streams varied in size and bridges also in every detail. He had himself passed over some very simple structures of the most rudimentary types, and many of them were in such a shattered condition for want of repairs that a respectably brought-up barn-door fowl might have thought twice before venturing to proceed. Mr. Simpson alluded to a slight sketch of a bridge over the Sutlej at Wangtoo. As that place was on the Hindostan and Thibet road, it might have been taken for granted that British engineers had something to do with it, but it was constructed in all its details on the native plan, and he was under the impression of having somewhere read that its span was 70 feet. The piers of each end were raised up from doorways. The object evidently was to give weight to support the large deodar trees built into it. An accompanying illustration represented a bridge over the Tonse River. Its details might easily be followed. Some years ago he had seen a picture of a Norwegian or Swedish bridge, so like these Himalayan bridges that it might have passed for one of them. After describing some of the bridges in Cashmere, Mr. Simpson remarked that none of them have railings, the absence of which was wont to strike the eye of a European at first sight of them. One of the bridges at Srinuggur, built in this style, had a row of wooden shops on each side, as if in quaint parody of old London Bridge.

In the discussion which followed, remarks were made by Lord Stanley of Alderley, Mr. Kidner, Colonel Yule, General MacLagan, Mr. Keene, Mr. C. Purdon Clarke, Mr. Lilly, and Mr. Phene Spiers. A vote of thanks was proposed by Mr. Lilly, and seconded by Mr. Spiers. The vote having been passed, the President summed up the discussion, and the meeting was adjourned.

THE LONDON SHOW-ROOMS OF THE COALBROOKDALE COMPANY.

AMONGST the recent additions to good metal-work in iron available to the metropolis may be mentioned the newly-opened show-rooms on the Holborn Viaduct by this eminent firm of iron-founders. It has long been matter of surprise to those conversant with the productions of the Company that such a step had not been taken long ago; but although, for reasons it is not within our province to enter into, it has been delayed until a recent date, events have proved already it has been a correct one, and we have little doubt that, from a commercial phase, the "new departure" will prove an unqualified success. If we pass over the time when the counties of Kent and Surrey were resonant with the sound of the then primitive mills or hammers, and when the blaze of the cupolas, or equally primitive smelting furnaces fed by the wood from the chalk hills of the district, cast their lurid glare on the surrounding neighbourhood, and helped to produce the celebrated charcoal iron of the district (and here we may remind our readers that the railings around St. Paul's Cathedral were made there), the Coalbrookdale Company was one of the first—certainly the first of any note—that was established in the Midland districts. We do not know the exact date at which the Company commenced their operations; but on the occasion of a visit we paid to the works a short time since, our attention was called to an old cast-iron beam built into one of the walls bearing the date of 1680, which is supposed to have been inserted on the occasion of some alterations being effected in the premises.

At so distant a date the requirements of the country for ornamental cast-iron work were not of an extensive character, and their annual output may reasonably be assumed to have been of an ordinary character for some time. But the Company have never ceased progressing; and if during a certain portion of their existence they may have appeared to surround themselves with a halo of conservatism, from a commercial standpoint, art work, when fairly entered into, was never allowed to recede at their hands, and many are the noble and original specimens of ornamental ironwork that have emanated from their works, and that to the present day are admired as works of art in many a public square or plaza in foreign countries, and of which drawings can be seen by the visitor to their works.

The Coalbrookdale Company have a trade-mark that all persons who have seen their advertisements must be conversant with. It is of conventional character, and consists of a bridge, a large star above and a vessel sailing underneath. To this trade-

mark a history, so to speak, attaches, that may be said to be national, for it is intended to illustrate the dawn of one of the uses to which iron has been adapted in the engineering progress, not only in England, but the world over. One of the partners in the firm having conceived the idea that a bridge of iron across the Severn was a feasible undertaking, eventually obtained permission to erect one, and in the year 1779 this (for the times) great work was completed, and formed the *first* of a series of such structures on which in after years the talents of most of our eminent engineers have at times been employed. So successful was this piece of work, that before very long replicas of the bridge were ordered by the authorities of Bristol to span the Avon, and by Bridgwater for the River Parrett. But the great civil engineer Telford had scrutinised the Severn bridge, and believed he had traced flaws in its engineering features that would prove disastrous to it, and desirous to show his skill at similar work, obtained permission to erect another upon his own plans about one and a half miles distant. This, too, was carried out by the Company; but great as the engineer's name became in after years, his first essay in iron-bridge building cannot be pronounced a success. Some time afterwards the bridge began to sink, and notwithstanding that the Coalbrookdale Company were called upon to repair it, it has been found necessary to limit the weight of loads crossing it, and the visitor to it at the present time may see a notice-board to that effect erected upon it. During all this time, however, the Coalbrookdale bridge has stood sound and erect, and is to all appearance as good to-day as when first erected, thus showing that the skill of the Darbys in this particular was equal to, if not superior, to that of the civil engineer. We may add that this bridge became the means of bringing into existence what is now a large neighbourhood, and "Ironbridge," the name it has assumed, is a thriving locality.

We cannot attempt to follow the Company through their development, but situated as they are on the banks of the Severn, with water carriage directly open to Bristol, the old western seaport naturally became an outlet for their productions; and nearly fifty years since a large dépôt was opened there, with show-rooms attached, which is in existence at the present day, which, had they been more favourably situate as regards London, the metropolis may probably have received. The Exhibition of 1851 brought the Company more prominently before the inhabitants of the metropolis and the country at large than at any previous period of their history, although they had previously been awarded by the Society of Arts their gold medal on two occasions—one for the bridge, and one for the excellence of their casting; and those whose recollection can carry them back to that time must well remember the magnificent works of art of which the "Eagle-slayer," and tower and dome of open ironwork, and set of grand-entrance gates, formed such a conspicuous feature in the centre transept. The original casting of the "Eagle-slayer," designed by Bell, and considered to be one of his finest works, is now to be seen at the show-rooms on the Viaduct, and the gates in question adorn one end of Rotten Row, near the Albert Memorial. The 1862 Exhibition found them again taking their position as the first iron-founders in the kingdom, and the Cromwell statue and another set of grand park entrance gates, modelled by their own designers (both of which are now at the Crystal Palace), were no less noticeable than their former efforts. Other beautifully-modelled sets of gates from their works adorn different parts of the grounds at Windsor and at Kew Gardens. During this decade one of the leading partners in the firm, Mr. Abraham Darby, took an active part in the Exhibition displays, and materially assisted the then manager of the Company in this department. For the following few years they did not exhibit so much, but in 1873 we find them at the Vienna Exhibition with a small but very high-class exhibit, consisting principally of outdoor appliances, in which gates and their *entourage* formed the principal feature. These were mainly designed by the late Mr. Talbert, and were generally allowed to be the best of their kind in the Exhibition. Since high-class grates and their appurtenances have been so much in demand, there is no firm that has appeared to better advantage than the Coalbrookdale Company, and within the last few years, since the demand has been created for the Queen Anne and Adam style, the Company have appeared to excel themselves; and the introduction of mantels and overmantels in iron, which first were exhibited at the recent Smoke Abatement Exhibition at South Kensington, has marked another epoch in the success of their undertakings. They have striven to present us with a suite of fireplace decoration, following in their entirety a defined style. Thus, instead of a grate of one design and a mantelpiece of another, with a pier-glass probably appertaining to neither, they offer us grate, mantel, overmantel, and the other accessories of kerb and fender, fire-irons, &c., all following one strictly defined design.

In introducing these and various other domestic articles, besides their own designers, who are gentlemen of undoubted ability, some eminent artists have from time to time been pressed into their service, and amongst these we may mention the names of Bell, Talbert, Edis, Carrière-Belleuse, Maurice B. Adams, Alfred Stevens, Wills, Norman Shaw, &c.

It may be supposed by many that from the history of the Company they are only iron founders *de luxe*; but such is by no means

the case, for they are enabled to produce all kinds of cast-iron work for interior and exterior decoration, of pure design, at a price to enable a contractor or builder of ordinary houses to purchase to advantage from them, and numerous specimens of this cheap class of work are to be seen in the new show-rooms, amongst them some remarkably low-priced examples of gates and palisading, and of grates. One of the newest "departures" connected with domestic grates shown, is one (Morton's patent) designed by Mr. Scott Morton, which contains on either side of the fire-basket a receptacle for coal. These are fitted to the grate somewhat in the form of a cabinet coal vase, the drawing forward of a panel giving access to the coal, a most convenient and excellent arrangement. To protect the coals from becoming heated, a slab of a non-conducting material which forms a perfect insulator is fitted at each side, and keeps them perfectly cool. It is impossible for us in the limits of this notice to mention all the notable features to be seen in the new show-rooms. Statuary, lamp pillars, and stands for electric lights form a large collection; hat stands tinted in different colours, hall tables, garden furniture, &c., are largely represented; while a fine display is made of kitchen ranges, and the ordinary attributes of the household in iron. We have only to add that the London establishment is under the direction of Mr. H. C. Eyres, a gentleman who has taken a very active position at the works for many years past, and whose technical and artistic knowledge renders the appointment likely to prove a most satisfactory one, both to the Company and their *clientele*.

GLASGOW INSTITUTE OF ARCHITECTS.

A MEETING of the members of the Council of the Institute was held on the 18th inst. Mr. James Thomson, the president, occupied the chair. The secretary read the recent correspondence with reference to the proposed new Glasgow Police Bill. (1) The following letter by Mr. Lang, the clerk of the Police Board, to him:—

"City Chambers, 74 Hutcheson Street, Glasgow, Jan. 12, 1883.

"Dear Sir,—*Police Bill*. The committee on this Bill meet on Monday first, 15th inst., at twelve noon, in the City Chambers, Ingram Street, to consider clauses 351 to end of Bill, which include the building clauses, and I have been directed to request your attendance at said meeting, along with such members of the Institute as you consider necessary, and be heard in reference to the provisions relating to buildings.—I am, &c.,

"J. LANG."

(2) Letter in reply by Mr. MacLean to Mr. Lang, enclosing the recommendations of the Committee of the Council of the Institute therein referred to:—

"196 St. Vincent Street, Glasgow, January 13, 1883.

"Dear Sir,—I have to acknowledge the receipt of your favour of yesterday. I tried to get a meeting of the Committee of the Council of the Institute to-day, but failed, both the President and the Convener being out of town. It will therefore be impossible, owing to the very short notice, for us to arrange a meeting on Monday, as you propose. I may state that those members of this Council whom I have been able to see regret to observe that clauses of the Bill which would have been affected by their suggestions have already been discussed and passed. I am able, however, to send you a recommendation which was prepared by the Committee of the Institute some time ago, and to which I take leave to refer the Committee of the Town Council.—I am, &c.,

"WM. MACLEAN, Sec."

Recommendation referred to in the foregoing letter:—

"December, 1882.—The Glasgow Institute of Architects recommend that all clauses of the draft Police Bill relating to (1) the jurisdiction of, and procedure before, the Dean of Guild; (2) the Master of Works, his powers and duties; (3) the formation of new streets; and (4) the erection of and alteration of buildings, should be omitted from the Bill, and that such clauses, amended and amplified, should form the subject of a separate Act. The resolution of the Town Council to delay proceeding with the Bill in the ensuing session of Parliament makes it possible for them not merely to consider deliberately the advisability of the course recommended by the Institute, but also to draft such a measure as has been above indicated, and in view of the action taken by the Lord-Advocate the Institute think it of the greatest possible importance that this work should be undertaken by the Town Council, so that their advice on this, as well as on matters of police, may be brought before his lordship. Without expressing any opinion on the advantages or otherwise of a Police Act being made general, we would venture to say that the advantages of making a Building Act general are manifest and undeniable, and we are most anxious that the present favourable opportunity of obtaining for Scotland a suitable measure of the kind should not be lost.—In name of the committee, WILLIAM MCLEAN, Secretary."

On the motion of Mr. Honeyman, the Convener, the actings of the committee of the Council of the Institute on the Police Bill were unanimously approved of. Some other business of a formal nature was transacted before the meeting separated.

NOTES AND COMMENTS.

IT must be confessed with some humiliation that if the late GUSTAVE DORÉ often failed to do justice to himself, the cause was the condition of English taste. In his early illustrations there was nothing to suggest that he was destined to be a painter of scriptural subjects. But he was persuaded that England was a religious country, and that biblical scenes would be a success here. His pictures were not only profitable to himself, but on his visits to London he could hardly fail to see the walls placarded with the declaration of English critics that DORÉ was the true successor of the great Italians. It would be strange if he ceased to supply so excellent a market with prodigious works, or thought humbly of his ability. For French eyes he produced pictures of a different kind—like the small landscapes which appeared in the last Salon. He had the failings of self-taught men, but if he had lived he probably would have done work showing more recognition of the principles of art. Of his versatility there could be no question. If DORÉ had not been indifferent to facial beauty, he was competent to illustrate the *Midsummer Night's Dream*. Yet he was almost the only man of our time who could represent a mob in all its hideousness. By studies in the slums of Paris and London he endeavoured to be a realist, but his best works are the illustrations of "Don Quixote," in which representations are given of a country he had not visited, and the fantastic mediæval scenes which he drew in his boyhood for Paris newspapers.

LORD BANDON has sent us a prospectus of the exhibition of arts, products, manufactures, and machinery which is to be held in Cork during the summer and autumn of the present year. It is satisfactory to find men of many parties uniting for the furtherance of so excellent a project, and we hope the committee may be successful in securing an adequate guarantee fund. It is announced that Irish art is to form an important feature in the exhibition. The city which produced MACLISE and FORDE is supposed to be the most artistic of all Irish towns, and there ought to be little difficulty in making a collection that would demonstrate what Irish painters and sculptors have done. But there are very few names on the list of the general committee which represent art. Why, for instance, is Mr. T. N. DEANE's name absent, when it is known that his family have been connected with the architecture of Munster for many a generation?

SOME auctioneers who sell pictures endeavour to supply the deficiencies in knowledge of those purchasers who think it right to possess paintings, although they may care little for art, by introducing criticisms into their catalogues. A picture may be of little value, but when a shopkeeper finds that the *Times* is represented as saying, "this is one of the best pictures by MACGILP we have ever seen," he may be disposed to be liberal in bidding for it. When quotations of this kind are introduced (and they are taken from a catalogue issued during the week) it would be an advantage if the date of the criticism had been given. Then, again, when the catalogue states that "the papers say," when describing Mr. EASEL's works, "the rapid strides made in the profession by this rising artist, stamp him as a man of genius and ability, whose career must be a grand success," a suburban amateur is not unlikely to fancy that one of those masterpieces is a good investment. Where the auctioneer becomes the critic there is more security for the public. Thus, for example, when it is said of a painter that "there is no living artist who can produce such wonderful effect with such a remarkable minimum of colour"; or, "the painter of this beautiful picture stands almost at the top of the artistic world"; or, "visitors to the Royal Academy during the last exhibition were doubtless much impressed with this artist's works," none but foolish readers would be excited by the eulogies. It is not necessary to append puffs to the entries of household furniture and other goods to secure a sale, and the question arises, Why cannot pictures be sold under similar conditions?

AT a special meeting of the Manchester Chamber of Commerce, which was held on Wednesday last, a letter from the Board of Trade with reference to a standard wire gauge was submitted. It stated that valuable information had been

received in answer to the Board's circular, communicated on April 15 last, and it appeared that the sizes therein suggested on the whole met the requirements of trade. With regard to the larger sizes, however, it had been thought desirable to modify the original scale, and the opinion of the Chamber was asked upon certain suggested modifications. The Board of Trade added that should the scale now proposed be generally approved, they would advise her Majesty in Council to authorise its use, and it was hoped that such authorisation, with the provisions of the Weights and Measures Act in regard to the use in trade of measures for which Board of Trade standards have been made, will assure for the standard wire gauge a prospect of success. The following resolution was adopted in reply to the letter:—"That this Board, without in any way offering an opinion as to the proposed sizes, considers that the interest of the wire manufacturers using the gauge deserves the first consideration, and it hopes that the standard definitely legalised will interfere with sizes at present used by that trade as slightly as possible."

AMONG the recent discoveries at Hissarlik by Dr. SCHLIEMANN are the remains of buildings which he supposes to have been temples. The walls are respectively 1 mètre 45 and 1 mètre 25 thick. Nothing, he says, could better prove the great antiquity of the buildings than the fact that they were built of unbaked bricks, and that the walls had been baked *in situ* by huge masses of wood piled up on both sides of each wall and kindled simultaneously. Each of the buildings has a vast vestibulum, and each of the front faces of the lateral walls is provided with six vertical quadrangular beams, which stood on well-polished bases, the lower part of which was preserved, though, of course, in a calcined state. Dr. SCHLIEMANN maintains that in these ancient Trojan temples we may see that the *ante* or *parastades*, which in later Hellenic temples fulfilled only a technical purpose, served as an important element of construction, for they were intended to protect the wall-ends and to render them capable of supporting the ponderous weight of the superincumbent crossbeams and the terrace. Similar primitive *ante* were found in two other edifices, and at the lateral walls of the north-western gate. It was also discovered that the great wall of the ancient Acropolis had been built of unbaked bricks, and had been baked like the temple walls *in situ*. According to Dr. SCHLIEMANN, a similar process of baking entire walls has never yet been discovered, and the *ante* in the Hellenic temples are nothing else than reminiscences of the wooden *ante* of old, which were of important constructive use.

THE Manchester Academy of Fine Arts held its twenty-third annual meeting on Tuesday. This Society at present consists of thirteen honorary and forty-nine ordinary members, twenty-five associates, fifteen lady exhibitors, and thirty gentlemen and twenty-six lady students. It was reported at the meeting that the artistic and financial condition of the Society was prosperous, and that, having uninterruptedly grown in efficiency since its first formation, the Academy might be considered one of the most important of art institutions in British provinces. Whether the handing over of the Royal Manchester Institution to the Corporation will affect the interests of the Academy remains to be seen, but the Council apparently have their fears on the subject, which has so far been a source of great anxiety to them.

MESSRS. HOWARD & SONS, of Berners Street, have prepared an excellent catalogue of their furniture, and it has the advantage that it represents things which really exist. In too many brochures of its class the furniture is more or less unreal, or is not to be obtained without having recourse to other firms. Such things represent an agent's rather than a manufacturer's business. Messrs. HOWARD's catalogue begins with the furniture of bedrooms of an inexpensive class, and extends to elaborate interiors—in which some of their specialities, such as parquet flooring and wainscoting, appear. One of the advantages of the catalogue is that in it the prices are stated plainly, and throughout it is of a straightforward and business character. The illustrations of decorative work comprise many excellent examples, and, it may be said, every article of furniture shows the hand of an artistic designer. It is unnecessary for us to speak of the quality of Messrs. HOWARD's work.

THE NILE FAIRIES.

THIS illustration is a copy of a wall decoration which was executed in silk, and was designed by M. MAZEROLLES, the artist who painted the ceiling of the Théâtre Français, a work which is familiar to most visitors to Paris. M. MAZEROLLES is gifted with imaginative power, and in the Nile Fairies, as in his other decorative works, we see an example of it. The subject is not interpreted literally, but it becomes a sort of glorification not only of the nymphs of coffee and tobacco, but of evening and home enjoyments. The work would be prized by poor COWPER, the poet, as realising to some extent the thoughts which were in his mind when he exalted the tea table. But a French evening gives an opportunity for something more than serious conversation, and accordingly M. MAZEROLLES introduces representatives of music among the Egyptian genii.

DESIGN FOR A PUBLIC LIBRARY.

WE publish this week a reproduction of the creditable design by Mr. W. G. B. LEWIS, which carried off the English Travelling Students' Prize in the Royal Academy Competition of 1882.

The following were the conditions:—A public library for a small provincial town. Principal accommodation to be on

GROUND FLOOR.—Entrance hall and staircase; lending library; news room; sub-librarian's room.

FIRST FLOOR.—A large reading room; manuscript room; librarian's room.

The store for books, porter's room, &c., will be in the basement, of which no plan is asked for, so that it need not occupy the competitor's attention. The drawings required were:—(1). Principal elevation to one-fourth scale. (2). Plan of ground and first floor section side elevation to one-eighth scale. (3). One imperial sheet of details, mouldings, and ornament to one-fourth full size. The area of ground (including areas) was not to exceed 7,000 square feet (100 feet by 70 feet) and it was supposed that no light was obtainable from back.

In arranging the plans, the alcove principle for the libraries has been discarded, as being only suitable for a private library. Each department has been kept separate, forming reading-room (for public) supply, attendants, and library or book-room, &c.

In the libraries the bookcases have been kept away from the outer walls, to avoid damp, kept close together, and arranged so that the light may pass down the alleys between the rows. The floor being formed of iron gratings, will admit light through them, and prevent the books on the shelves next the under side of floor being placed in the dark, and allow of greater facilities for heating and ventilation. The mezzanine covers the whole of first floor, except the reading-room, where there is a gallery only. A gallery across the upper part of staircase forms a communication at this level, for the use of attendants only. The mezzanine over the ground floor covers only a portion of it.

The ornament introduced into the elevation alludes to the supposed founder, Sir EDMUND GREYHOUND, crocodiles being his heraldic supporters. The inscriptions between the upper and lower storeys are quotations having reference to libraries, books, and learning, such as "Cease not to learn until thou cease to live," "Reading furnishes the mind only with materials of knowledge," &c. Over the main doorway are the words which were written over the entrance of the library at Florence, erected by COSMO DE MEDICIS. The names of various famous libraries are inscribed on panels between the windows of ground floor.

HOUSE AT HEATON.

THIS house, which belongs to Mr. J. N. D'ANDREA, is built on the Basque principle, under one roof, with covered balconies on the south side, the north side being kept low to give the sun an opportunity of shining in winter on the house and greenhouse adjacent, as well as to assist in the more picturesque grouping of the two. On this side is placed, approached by porch and lobby, the hall with a fireplace of the "olden time," lavatory, &c., butler's pantry, w.c., staircase, larder, kitchen, scullery, stores, &c.

On the south side are two sitting-rooms, opening into a conservatory. There are six bedrooms, a dining-room, bath-room, and housemaid's sink.

The walls are built of coloured wall-stones known as "insides," and half-timbered brickwork covered with Portland cement stucco, finished Parian and painted a cream-colour.

All the interior woodwork is of selected pitch pine, the hall being boarded throughout. Coloured lead-light glass is introduced in the upper parts of the windows in every room, &c.

The architect is Mr. W. A. HERBERT MARTIN, of Bradford.

NEW SCHOOLS, DONEGALL PASS, BELFAST.

THESE schools have been just completed, and supply a much-needed want in a thickly-populated district. The main entrance, shown in the drawing, gives access to the infants' school, 42 feet by 32 feet. Behind this is a school-room of smaller size. The circular tower, which is 70 feet high, contains a staircase leading to a girls' and boys' school-room, about 50 feet by 44 feet. Another entrance and staircase is approached from a side street.

The walls are built of red perforated bricks set in black mortar. The stone used is red Ayrshire sandstone. The contractor for the works is Mr. ROBERT CORRY, and the architects Messrs. YOUNG & MACKENZIE, Belfast.

TERRACE HOUSES, BASFORD, STOKE-ON-TRENT.

BASFORD is a small residential suburb of the borough of Stoke-on-Trent, situate a few minutes' walk of Etruria, an important station on the North Staffordshire Railway, and in close proximity to the pottery towns. A great portion has been laid out for building purposes, and has unfortunately fallen into the hands of speculative builders, who have run up their usual productions without any architectural assistance, the result being that the buildings present the monotonous and inartistic aspect naturally resulting from that mode of procedure.

The houses, eighteen in number, and a portion of which are shown in the accompanying perspective sketch, are now in course of erection; and in their design an attempt has been made to give to a class of property very much in vogue in the district some distinctive character, at a slight additional expense, and without in any way sacrificing convenience to mere architectural effect.

The external walls are built hollow, and faced with pressed bricks of a deep red colour set in black mortar, and the roofs will be covered with brindled tiles of local make. The pediments to doorways are constructed of moulded bricks and terra-cotta of special design; the window sills are of hard Yorkshire stone, and the windows, including "bays," are of wood throughout, fitted with casements and sashes, the upper portions of which are intended to be glazed with leaded quarry glazing in plain patterns.

The timbered gables will be of Memel, the panels being filled in with brickwork, finished externally in Portland cement.

The work is being substantially carried out by the proprietor's own workmen, from the designs and under the immediate superintendence of the architects, Messrs. CHAPMAN & SNAPE, Newcastle-under-Lyne, who have recently designed and carried out a large hotel of somewhat similar architectural character for the same gentleman.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

AT a meeting of the Civil and Mechanical Engineers' Society held on the 18th instant, the President, Mr. R. Harkness Twigg, M.I.C.E., in the chair, a paper was read by Mr. H. Michell Whitley, C.E., on the Process of obtaining Sanction for Public Works in Great Britain. The author first drew attention to the terms by which landed property is held in Great Britain, to acquire which by compulsory powers is one of the main objects of an Act to construct public works, after discussing which the procedure before Parliament was described, especially the preparation of the Parliamentary plans and sections. In this the author urged that more time should, if possible, be allotted to the surveys, and especially insisted on the need of accuracy in all portions of the work, considering the rigorous examination to which plans are subjected before the examiners of standing orders. The remainder of the paper dealt with the subsequent process of the Bill until it received the Royal assent and became an Act of Parliament. A long discussion ensued, in which the president and Messrs. Bird, Munday, Walton, Whittaker, Brewster, Burbridge, and Child took part.

THE ARCHITECTURAL ASSOCIATION.

THE fifth ordinary meeting of the Association was held on Friday evening, the 19th inst., Mr. E. G. Hayes, President, in the chair. The following gentlemen were elected members:—Messrs. E. J. Lines, E. G. Salter, A. J. Cooke, J. S. Thomson, C. H. Cooper, J. M. Geden, H. F. Tomaline, H. J. White, J. E. Inglish, S. Piper, A. Lines, H. P. B. Downing, and J. H. Harker.

THE PRESIDENT announced the prize award by the Sketch Book Committee as follows:—

A prize of five guineas for the best design for title-page for Vol. II. to Mr. William Leck.

A prize of five guineas for the best set of five transfers contributed by any member during Vol. II., to Mr. Leonard Stokes.

A prize of three guineas for the best set of three plates, to Mr. Thomas Garratt.

THE PRESIDENT remarked that the Committee would be glad to receive the names of new subscribers to the Sketch Book, and expressed a hope that members would not only subscribe but work up sketches.

Mr. F. E. EALES, Hon. Secretary, said the first visit of the session would take place on Saturday (to-day), the 27th, to a new house at Bedford Park, built by Mr. May for Dr. Hogg.

THE PRESIDENT then called on Mr. Lewis F. Day for his paper, entitled:—

The Ornament of the Period.

Mr. DAY said: Some objection may fairly be taken to the title which I have chosen for the subject of this evening's talk—the Ornament of the Period. What is it? Well, sometimes it is Greek, sometimes Roman, sometimes Mediæval, more or less ingeniously done anew. It may be of the sixteenth century, or the seventeenth, even of the eighteenth—in fact, of any century but the nineteenth, of any period but that in which we live. So emphatically is this so, that we might fairly say that the one thing certain about the ornament of the period is its non-existence. But that is only half the truth. Equally true is it that something of us and of our time must be embodied in the work we do; and even if there were no other quality about it appertaining to us, it would betray to the “coming races” its nineteenth century date by the very simulation of earlier periods which belongs distinctly to our age.

It is rather a remarkable circumstance that all this repetition in which we indulge is done in the avowed honour of old work, in which there was scarce ever a trace of any such thing as the attempt to reproduce the past. The men who did the real, good, old work were men wise enough in their generation to let bygones be bygones, and yet we think to do them honour by doing just the opposite to what they did, and what they themselves would heartily have abhorred. Whenever we repeat the forms invented by them there is all the difference between our work and theirs that there is between invention and mimicry, between reality and affectation, between life and galvanism. I said that the ornament of the period had some character of its own; but it is a character more honoured, to my thinking, in the breach than in the observance: what distinguishes nineteenth-century ornament from all other is its insincerity, its unreality. I have no wish to dogmatise, and no intention of decrying those who may feel differently from myself. It is quite possible for a man to be so deeply imbued with the art of a past period that it comes naturally to him to express himself in its language. And we could ill spare the utterances of some of these men. Indeed, the very affectation of a sentiment argues the existence of the sentiment affected, as surely as smoke betrays the presence of fire. But the men who live in the past are not, and in the nature of things cannot be, the majority; nor yet are they the true exponents of this age of ours. Perhaps we may even be permitted to bear them some slight grudge, inasmuch as they are in a degree responsible for the affectation of the feeling which really inspired them. Anyhow, that affectation has grown apace in recent years, and it would scarcely be too much to say that it has choked the growth of genuine design among us. Surely that is a serious cause for quarrel with it. The student is taught from the beginning to lisp in a tongue that is foreign to him. Some liberty of selection is, indeed, allowed; he may choose the dead language in which to express himself; but it must be dead—that is the one restriction. The sin unpardonable is to indulge in a natural ejaculation. It is time to rebel against such bigotry? What right or reason is there in it?

Why should I say I see the things I see not?

Why be and be not?

Show love for what I love not, and fear for what I fear not,

And dance about to music that I hear not?

If, indeed, the music of the past charm your ear and incite you, frisk away, by all means, to the tune of “Auld Lang Syne”; but the mischief is that we are expected to dance about to music that is mute to us, and a sorry figure we cut. There is something infinitely ludicrous in the notion of the members of a serious and sedate profession moving in steps stately or grotesque, as the case may be, to a music so far off that not even the echo of sound

reaches our ears. We might forgive them that, and even enjoy the fun of it, if only we believed that they themselves moved spontaneously to a measure audible to their more delicate nerves alone; and if they say that they hear it, we are bound, even though their movements be not rhythmical, to believe them, however inconceivable it may be to our grosser senses. But when they would compel us to join hands and mingle in the fantastic dance, then it is high time to speak our minds; and even if we protest somewhat strongly, there is some excuse for strong language. No one will be at the pains to deny that the essays in style, which constitute the greater part of modern architecture and ornament, do to a certain extent exercise the faculties of the student; but it does not follow that education of a different sort would not have developed them to a much further degree. We may acknowledge that the Latin verses which absorbed so much of our time at school were not without influence on us for culture, without denying that our time might have been very much better spent than in writing doggerel in a dead language; and whatever may be thought of the study as a sort of intellectual gymnastics, calculated to develop and strengthen the fibre of the brain, no one contends for the verses themselves that they are anything but exercises; neither have our ingenious experiments in Classic, Gothic, or Renaissance style any just claim to be more than exercises. They stand to art much in the same relation as did our boyish Latin verse to poetry. Now and again a poet, like Gray in the last century or Landor in this, chooses to express himself in a tongue that can appeal only to the learned few; now and again a painter sees fit to express himself, so to speak, in the language of learning rather than of art. Such men may be poets, indeed; but if they decline to use the vulgar tongue, they have no right to look for the appreciation of those who know no other. And if an artist choose to masquerade in the guise of an antiquary, he has none but himself to blame if he be mistaken for something less than an artist. There is some satisfaction, to my mind, in the certainty that the artist, of whatever class, who poses as an antiquary does, by so doing, shut himself out from the sympathy of his contemporaries. The number of the public who really care two straws about style is infinitesimal. They are certainly not enough to keep a profession going. And, since it is ultimately upon them that the bread of the artist depends, the prospect is not quite so hopeless as at first sight it would seem. The artist may be starved into sympathy with his age. Not to speak of the public at large, I cannot bring myself to believe that the main body of architectural students really feel that the expression natural to them is that of the thirteenth, sixteenth, or any other century than our own. Such a state of things could be explained only on the supposition that those alone who had archaeological tendencies were attracted to the architectural profession. The student soon comes to appreciate the value and beauty of style in old work, but the one idea associated in the mind of the general public with styles and periods is that any one of them in itself is monotonous and wants the “relief” of some other style to “set it off.” An example of this popular notion, familiar to all, is afforded by the type printer. He is a flagrant instance in point. Give him a simple title-page or prospectus to print, and he will set it up in types of as many different periods as he can possibly manage to introduce—“displaying it,” I think he calls it—and a pretty display he makes of his ignorance. Between such ignorance and the pedantry of the purists, surely there must be some course open to a man who acknowledges to himself that he belongs, not to some generations after his time, but to his own day. It is curious how the public have allowed the style of this period or that to be fastened upon them, caring in their hearts about neither one nor the other. Had they cared, they would not have submitted so easily—certainly they would have hesitated before allowing the deposition of the reigning sovereign in favour of the ghost of Queen Anne. They had always just a suspicion of their own deep ignorance of the subject, and dared not, therefore, follow any fancy they may have had for this or that. Their most potent impulse (if that may be called an impulse which is only a fear) was and is the dread of singularity. Safety there is, of course, in holding on always to the skirts of the past; but it is to be hoped that there is more of the spirit of art militant in us than that we should rest content with the laurels (dried ones) other men have gained in other days. It was by no such timidity that they won their wreaths. And if cowardice is to be considered as a characteristic of modern art the sooner we throw up the sponge the better.

Of course we owe our possibilities in a great measure to the labours of the archaeologist and antiquary. It is they who bridged over for us the gaps between the periods of art and our own day; but we have already paid a heavy price for the accommodation, and artists can scarce help feeling that the time has come when the toll should be abolished. The high road to excellence should be open to all men. The sad and serious side of the question is that so much of the modern work which does not affect any fashion of past art shows a hopeless ignorance of style altogether—an ignorance, indeed, of what style is. There are such abundant instances of ignominious failure to which the adverse critic could point and say, “Is that the kind of thing you advocate?”

We will not speak of architecture proper, for that might be difficult and delicate ground to go over. But think for a moment

of the productions of the uneducated draughtsmen who boldly rush in where architects fear to tread, and furnish nondescript designs for all the miscellaneous wares which fill the fashionable, fashion-fostering shops, and flood the world with rubbish. The thought is enough to make us tolerant even of the intolerable vice of pedantry. There is a class of workmen who think that to put a fret border round a panel will make it Greek, that you have only to flatten out a sprig of foliage to make it Gothic, and that if you start from one corner, and only partially occupy the space, it is, without more ado, in the manner of the Japanese. They have a notion that originality may best be displayed by piecing together scraps of all styles under the sun. They think that the forms are the style, and have no conception of the spirit underlying old work. This is not exaggeration. The confusion of ideas in the public mind as to what constitutes style is a tangle as dense as one can imagine. And this applies to those who ought to make it their business to know better, and who are, in fact, purveyors of bad taste to the public. I have before now been asked to design a stained-glass window in which the central subject was to be a group of flowers, as naturally treated as might be, surrounded by a border in imitation of a Persian carpet. The question may seem to you to be beneath the consideration of the architect, but indeed it is not a matter of slight importance to any one who believes at all in the use of art. Recollect the enormous power in the hands of a single ignorant or interested person of propagating what is, artistically speaking, monstrous. I was asked not long ago to furnish a new design for the binding of a popular periodical, and I took some interest in doing it. Imagine my disgust when I found it had been produced in the crudest conceivable shade of a colour which it would be cruel to call violet. I am afraid to say how many tens or hundreds of thousands of these abominations it was proposed to distribute over the country. Happily, the bookbinder for whom I was working was a man of taste, and the publisher was not altogether unamenable to persuasion, so that eventually only a portion of the volumes, I believe, were issued in the objectionable colour, but every one that was so issued "made," as Mr. Matthew Arnold would express it, for the demoralisation of popular taste.

Now the fact (which I have admitted) that most of our attempts to run alone end in disaster is no argument for resting content to cling for ever to the apron-strings of our nurse. We are none the worse for the bumps and bruises that followed on our first childish attempts to walk alone. And neither will art in the end be the sufferer, but very greatly the gainer, by some venturesomeness on our part. What a delight it is always, in old work, to see where the artist has dared something, and how interesting all transition work is, from the very circumstance that you never quite know what will be the outcome of the meeting of old and new influences. Think of any one of the great cathedrals that have grown to what they are—where Norman pillars support Gothic arches, and Decorated chapels cluster round an Early Gothic apse; whilst the nave is lighted by windows of Perpendicular or Flamboyant type; and maybe the portal shows traces of Renaissance influence. How deadly dull it would all have been if the successive generations of artists, through four or five centuries, had felt themselves called upon to play at "follow my leader." How dull it is where now and again the old men did hark back to a past period—as in the case of the cathedral at Orleans, reconstructed after 1600, in a style that may best be described as galvanised Gothic. Happily, instances of the kind are not numerous; for the most part, the men of former centuries knew how to graft their own living style on to the old stock in a way that is more than satisfactory. Many of you are, no doubt, familiar with the west front of the cathedral of Bourges. The arcading of the lower wall suffered some dilapidation, and it was necessary, early in the sixteenth century, to repair the mischief. The question was, How? The original arcading was of the thirteenth century, with trefoiled arches, the capitals (and spandrels, too, if I remember) enriched with the usual Early French foliated ornament. It would have been absurd to pull down the old work and build it all anew; equally absurd, as they thought, and as modern architects do not appear to think, to copy in the new work what remained of the old. And yet unity of effect was bound to be preserved somehow. Their solution of the problem was characteristic, and as simple as Columbus's egg. They just accepted the old lines of the arcading, and filled them in after the manner of the days in which they lived, and in which they were accustomed to work. We have thus an arcade of Gothic arches, with carved enrichment of Renaissance design. The general effect is perfectly harmonious and undisturbed. Only when you come to look into the ornament do you become aware that it has individuality of its own, instead of being a cold copy of the earlier work. It is a bit of history, in fact, and the more interesting accordingly. Its occurrence in this stately front is as welcome as one of those traits in the life of a great man which show us a glimpse of his personality, and reveal his relation to ourselves.

(To be continued.)

Mr. J. W. Connon, F.R.I.B.A., read a paper on "Kirkstall Abbey" at a meeting of the Leeds Architectural Society on Tuesday last

ON THE USE OF BUILDING STONES.*

BY JAMES GOWANS.

(Concluded from page 43.)

6. How to use Stones in the Superstructure.

THERE are many ways of building, but whatever kind of work is adopted, whether ordinary rubble stone, cubic stone, or ashlar, the great secret is to make every stone do its fair share. The true way of doing this is to build the walls from front to back of stone as nearly equal in thickness as possible—that is, of stones of cubic dimensions, or stones of a large area, examples of which we have in the remains of Egyptian and Cyclopean masonry. This is particularly desirable in the space between the foundation courses, and where the face of the wall comes to be seen; good masonry is required for this, although it is often otherwise, owing perhaps to its being buried and out of sight. For the abutments of bridges or piers of viaducts, cubic stone only can be used with safety. Where a great load has to be carried, to build with cubic stone facing and rubble stone backing is a mistake, unless the rubble stone is of large size and carefully bedded. With cubic stone and ordinary rubble you have in the outer face of the wall fewer beds and less mortar than in the backing, so that when the strain comes there is fracture, or a tendency for the wall to yield to the weaker side. Walls, as a rule, are much too thin to allow of the interior of a building being kept at a desirable temperature; thick walls are necessary. I would have all outer walls not less than 2 feet 6 inches, and, as applied to chimney-heads, you will never have a good draught in chimneys that are thin after passing through the roof. Unless they are thick, the current gets chilled and choked, owing to the cold damp air it meets with from the thinness of the masonry; and, further, it leads to disfigurement, by the use of cans, cowls, and such like contrivances, of what the architect should make one of the most telling features.

7. How to use Stone for Coursed Work.

The variety of this work lies more in the mode of dressing than of building. There are, for instance, hammer-dressed and nidded coursing, both done with the hammer, the difference between which has led to many disputes.

Specimens of ordinary hammer-dressed coursing may be seen on the back walls of the older buildings of the New Town, while in many of the same where modern additions have been made, nidded coursers have been used, both as different as to cost as that of ashlar and ordinary rubble work.

There is also pick-dabbed coursing, which requires to be clearly defined, as without a specimen it may be interpreted to mean work done with the ordinary pick, which belongs to the builder; or it may mean work which can only be done by the point or pick dabbler of the hewer. But before leaving this part of my subject, I do not know that anything more valuable could be done through your Association than to have a clear and well-considered specification prepared, treating of all kinds of work. This would be certain to lessen, at least, the differences so often arising between architects and builders as to what is meant.

8. How to Build with Ashlar-facing and Rubble Backing.

For ordinary purposes, where there is no great load to carry, to build a substantial wall the ashlar should be well squared on the beds and joints, and laid in a good swimming bed of lime, not stones with slack beds, which the builder has to pin up to bring to the plumb, but square, well-hewn beds which will bear equally on the mortar and stones below. The builder has no excuse for not bedding them well, as with the machinery now in use, such as steam cranes and such like appliances, he never needs to put his hand to the stone, but can at once have it lifted and rebbed without the slightest effort or trouble on his part.

A great mistake is often made in laying ashlar with too thin a bed of lime, and also jointing too closely. This may look well, but hard to hard is bad masonry, as when the pressure does come a fracture from the face is sure to follow; and I have observed buildings where the architect or clerk of works was anxious to show thin beds and close joints sadly defaced although otherwise well built, and that with the hardest of material. All ashlar work after being backed up should have the joints well grouted with thin lime, this especially in walls that are much exposed to rain and in such a climate as ours.

The backing of ashlar, or hewn work of any kind, should be of large-sized rubble—every stone being well knocked to its bed—not simply tapped with the light hammer now in use or the edge of the trowel, but with the old-fashioned cairn hammer which every good builder had beside him on the scaffold fifty years ago.

I cannot help noticing here how different the tools which builders now use are from what they were in the time I have referred to. Then they had a large-sized trowel with which they did not spare the mortar, and the large hammer which was freely used and never failed to bring the stone to its bed. Another tool was the hawk hammer, with one end of which the stone was squared

* A Paper read at a meeting of the Edinburgh Architectural Association on the 17th inst.

and the other the inequalities were dressed off. The mash and pincher, first used by the hewer forty years ago, were handy tools for bending the checks of rybats, and removing the rough along the edges of the stone. Now these, with the clourer, are part of the builder's kit, and are used by him for doing that which the older hands accomplished with the hammer—work that was not only cheaper done, but far more tradesmanlike in appearance. Now it is a small trowel, and the lightest of hammers, which, if used, scarcely affects the stone at all. In short, the ordinary rubble building of the present day is not such as will maintain the character our Scotch masons had when I first remember.

9. *How to Dress Stone so as to get the Most Durable Surface.*

Of the various kinds of work adopted, and of which we have admirable examples in this city, I am of opinion that polished work is the best not only for securing durability to the stone, but also for bringing out the beauty of its texture and colour. Hammer-dressed, ridged, pick-dabbed, broached, scabbled, droved, and tooled work all tend to bruise the surface of the stone and thus expose it to the atmosphere; while the rubbing necessary for polishing removes the bruised material, and presents to wasting agents a surface more likely to prevent decay than any other kind of work I know of.

I have endeavoured to make this paper as practical as possible. Its consideration may be of some value to the architectural student, as it is a matter of regret that buildings on which the architect rests his reputation, and to which his genius has been applied, should perish either from faulty stone or bad masonry.

Five hundred years ago, when those beautiful examples of Gothic architecture were erected, with their traceried windows and vaulted roofs, the architect and builder seem to have gone hand in hand not only in planning, but in building up, on true constructive principles, edifices which have withstood the ravages of time for so long a period.

Before closing, I wish to allude to a custom which prevailed when such buildings as Heriot's Hospital were erected. Then every hewer indented his mark on the face of the stone he had hewn, and it may be of interest to visit this building and observe how carefully this was adhered to. You can by these means nearly ascertain how many hewers were employed on the work, how the structure was built up round and round, and how those most expert in their craft had allotted to them the stones to dress which required the greatest skill. I have seen the same marks on buildings I have examined all over the country. I had a hobby for collecting these some years ago, and visited many of the principal cathedrals and buildings in England. I made a large collection, but unfortunately have lost the record. But it is a custom I should like to see revived, as, in my opinion, it would not deface the stone if done with the delicate and enduring touch which these old masons gave to work to which, no doubt, they attached a high value. Mark masonry, as one of the degrees in Freemasonry, had very likely something to do with the custom, but, although a Freemason myself, my paper precludes me following this phase of the craft further than to mention it as something that is at any rate suggestive.

With these examples before us, the appliances we have, and the teaching which every architectural student or working mason can get, we should be able to cope with those who have preceded us. I believe in the earnestness of the architectural student of the present day, but I am not so sure about the technical teaching or training the apprentice mason seeks after. When I first remember there were in the city many drawing-classes, chiefly attended by young men, who were either masons, carpenters, engineers, or mechanics of a like kind. There was Ruthven, on the Bridges; Milne, St. James' Square; Moffatt, George Street; Paterson, Stockbridge, and others—all teaching drawing, and making good incomes from the crowded classes that attended them. Now we have such institutions as the School of Arts to take their place; but I question very much if the classes are as well attended there as the others were in the time I have referred to. Besides this, there was at every important building a drawing-class, usually conducted by the chief foreman or clerk of works, which had the effect of theoretically educating the workman to a proficiency he could not otherwise have attained. In every squad there were numbers of men who were fit, from their intelligence and training, to act as clerk of works or foreman; and, in mentioning the former, I am of opinion that the well-trained mason is better for such a trust than the joiner.

No mason or joiner can be perfect in his trade, or have his heart in it without a knowledge of drawing. As to masonry, I know of no trade that affords greater scope to the studious mind. To be proficient his head and his hands must work together. There is endless variety in the operations he has to perform, and it is far removed from work that is nearly, if not altogether, mechanical. I trust that as education (especially technical) advances, we may have a race of masons who will be something beyond mere machines, and who, by their training, will help in no small degree our architects to carry out buildings whose architecture will be worth copying even by generations to follow us.

EDINBURGH SCHOOL OF ART.

THE prizes won by the students of the Edinburgh School of Art were presented on the 18th inst. Sir Arthur Halkett presided. The report stated that the number of students under instruction in the school during the year was 793—in the male school 495, in the female 298. Compared with the previous year this showed an increase of 5 students in the male, and a decrease of 28 in the female school. The results of the students' works executed in the school as tested by the examinations under the direction of the Science and Art Department had proved satisfactory, though as regarded the national competition and third grade, not equal to the results of some former years.

The Chairman in his address said:—We have again to congratulate ourselves and the art-loving population of this country in general, that for five years in succession one of the few gold medals given by the Science and Art Department has again been brought to Edinburgh. No doubt many of the ladies and gentlemen whose successful labours we are about to reward intend to make painting or sculpture their profession. Others, again, may pursue the art as an amusement to while away a leisure hour; for there is no doubt that drawing forms an elegant and agreeable pastime, equally suited to both sexes and to all ages; and at all times forms an attraction to the polished mind. But I would remind each of you that painstaking and careful drawing must always be the basis of successful work. How many young students there are who fail in attaining success, not from any want of skill in design, but from carelessness in execution, though perhaps their colouring may be all that could be desired. Recollect that a beautiful outline, even without colour, may please and delight the eye; but it is perfectly certain that the most delicate tints or the most gorgeous colour will fail to please if the outline is incorrect. We amateurs who year after year look forward with so much pleasure to the exhibition of the works of our living artists on these walls or on the walls of the Royal Academy of London, or who gaze with rapture on the works of the old masters, are apt to forget the time and labour and painstaking carrying out of detail which culminates in the finished work. But beautiful tints and lovely forms do not alone constitute a work of art. There must be the expression of some noble sentiment or some deep thought; and, therefore, I would urge on those students who would excel in their profession to study history, to make themselves conversant with the noble deeds of chivalry, to read the works of our best poets, and by those means to foster in the mind a feeling of sentiment and romance. Another requisite is, of course, the study of nature—the only true source of beauty—to accustom the eye to what is naturally graceful, not only in the human form, but in trees, rocks, or rivers. Wordsworth, in describing a man with no love for the beauties of nature, or without any poetry in his soul, says—

A primrose on the river's brim,
A yellow primrose was to him,
But it was nothing more.

But the true artist must be imbued with the love of nature—of the flowers at our feet, the dancing shadows, the sunlight upon the grass, the silver-bordered rain-cloud, the saffron of dawn, or the crimson sunset—in fact, of those natural objects by which we are daily surrounded, and which perhaps for that very reason are apt to escape our regard. Many practically-minded people have questioned the utility of the fine arts. "What use," they say, "is there in painting or sculpture? Are they not merely feeble imitations of the originals which we all possess? Why can we not be allowed to admire the rugged scenery of the Trossachs or Killiecrankie, or linger over sunsets on Loch Tay, without ruining ourselves by buying your pictures?" This sort of argument puts one in mind of probably what were the thoughts in the mind of the Shah of Persia when he visited this country a few years ago. Being taken to the Academy he was much struck by a picture by one of our great animal painters, of a quadruped best known to us for its patience and the length of its ears. But he was very much struck at the price asked for this work. "What," said he, "so much for that little piece of painted canvas?" Why, I could buy the real animal in my country for a few shillings. Now, depend upon it, it is for some good reason that Providence has surrounded us, not only with what is useful, but with what is beautiful. The flowers, for example, the modest violet, or the "wee bit crimson tippit flower," are not mere cumberers of the earth. Do we derive no pleasure or joy from the hedgerow redolent with hawthorn, sweetbriar, and honeysuckle; are we taught no lessons from the running brooks, the budding leaves, or from those songs without words which we hear from the linnet and the thrush; is it all "unprofitably gay"—the golden bloom of the gorse, the purple of the heath-clad hill, the yellow of a waving cornfield, or the calm azure of the sky above us, leading us to look through Nature to Nature's God? If, then, there be real utility, as I think, in the admiration of the beauties of Nature, I say it is right and proper that we should cultivate the art of imitating those beauties, that art which of all others elevates the mind and creates those sweet sensations necessary to our happiness. Let us, then, ungrudgingly pay those artists who excel in their profession all the

A Post Office is to be erected in Bradford, on a site in Bolton Road, which has been offered by the Corporation.

respect which is due to their genius. They are of the number of those whom Nature, sparing of her best gifts, grants but occasionally to the inhabitants of this earth. Those students who are turning their attention to modelling and sculpture have, perhaps, greater difficulties to contend with even than their brethren of the brush. For they have no picturesque accessories, no backgrounds, and very seldom a plurality of figures. Their art is distinguished by its simplicity—in fact, their works must depend for whatever artistic value they may possess on gracefulness of form and nobility of imagination. Recollect that a thing of beauty is not always a joy for ever. "Passing away" is written upon all things earthly; but the sculptor may take courage in this, that his ideas, being expressed in solid material are perhaps more durable. Recollect those beautiful statues which have just been brought to light near Athens, which, having been buried in the earth for centuries, are now as pure in form and quality as if fresh from the chisel of the master. When in the not far distant future your works come to be exhibited to the public in these galleries, do not be discouraged by the sometimes too severe remarks of some "spiteful stranger" or some captious critic who may come among us taking notes. Recollect the pretentious critic in the adjoining country, who, stopping in front of a really beautiful picture of flowers and fruits, which he observed by his catalogue to be by a Scottish artist, took out his eye-glass and affected to scrutinise the work. "Oh," said he, "those Scotch fellows are nothing better than sign-painters. Here is no keeping, no perspective, no foreground; and just look at that fly which the blockhead has attempted to paint on that rose-leaf—why it is no more like a fly than I am;" and approaching his finger to the picture the fly flew away. The great interest I take in your present proficiency and future prospects emboldens me to urge upon each of you a habit of industry, not only of the hands, but of the mind. Do not indulge the notion that natural genius will succeed without cultivation. Art, like everything else, will succeed but by industry alone. Study the poets, for, as Goldsmith says, "Poetry is the guide by which all the nobler arts excel." Make yourselves acquainted, if possible, with the works of Sir Joshua Reynolds, whose volumes, Fuseli tells us, "can never be consulted without profit, and should never be quitted by the student's hand except to embody by exercise the precepts he gives, and the means he points out." Let it be the aim of each of you to emulate the fame of those masters, both past and present, who have done so much to maintain the high tone of excellence which distinguishes the Scottish school.

FIREPROOF BUILDINGS.

THE recent fires have inspired a great many articles in the newspapers, and in their desire for the safety of the public the writers have often magnified the dangers of modern buildings. The *Observer* of the 14th inst. contained a leading article which might be interpreted by its readers to be a lament over the inefficiency of modern building, and especially as respects fireproof construction. It was replied to by Messrs. Dennett & Ingle in the following letter, which was published in the *Observer* of Sunday last; but even stronger testimony might have been produced by them to demonstrate the advantages of their system of concrete arching and encasement of iron:—

To the Editor of the *Observer*.

Sir,—The importance which is attached to whatever appears in the *Observer* will, we trust, be taken as our plea for offering a few observations upon the vigorous article on fires in buildings which was published in your last number. While we agree with much of the reasoning of the writer, we venture to differ from some of his conclusions, and especially when he suggests the hopelessness of finding a building that is really fireproof. For more than twenty years we have been constructing fireproof floors, and they are to be found in the principal public and private buildings in the United Kingdom. Yet, during that long period there is not an instance where one of the floors has succumbed to fire. This fact is well known to architects, but as some of your readers may not be acquainted with what has been done to insure the safety of buildings, it is possible that many doubts might arise, followed by serious consequences. Thus, for example, no less than eight acres of our work is to be found in St. Thomas's Hospital, and if the notion got abroad that it was not what it was represented to be, much anxiety must be endured by the patients. Then it is suggested in the article that the corridors of the new Courts of Justice may become a source of danger. All the vaultings of the corridors in the building have been constructed by us in our concrete (they are not of stone, as is stated, although they may appear so); and we are confident that if a fire arose in one of them, it could not pass upwards or downwards through the material. We are no less confident about the safety of the floors of the courts and offices, which are also on our system.

When fires are considered, it should not be overlooked that in many cases the destruction is partial, and that in some parts of the country there are fewer great fires than in others. It was pointed out some time ago in the *Quarterly Review* that the Nottingham district was fortunate in its immunity owing to the nature

of one material, which is much employed in the buildings. "In Nottingham," says the reviewer, "where they have gypsum in the neighbourhood as they have in Paris, they form their floors and partitions in the same solid manner, and the consequence is that a building is rarely burned down in that town." A special preparation of the gypsum forms the matrix of our concrete. This material was alone found capable of withstanding the fierce fires in Paris during the Communistic outbreak—fires which were unparalleled in intensity. According to the report of the French Société Centrale des Architectes, rubble walls covered with a plaster of gypsum remained unchanged, so were the plastered wooden partitions and the oak lintels. A well-known London architect, Mr. R. W. Edis, F.S.A., who was in Paris at the time, and made a minute examination of the ruins, reported to the Congress of British Architects in 1872: "That generally throughout all the buildings it was evident that good plaster-work, either in walls or ceilings, invariably protected and saved in a great measure the materials it covered, and in many cases, while externally the limestone walls had been broken about and calcined by the fire, internally, where plastered, they had suffered comparatively little." Evidence of this kind is beyond dispute, and if gypsum has been found so efficacious in Paris there is no reason why it should be a failure in England.

As the writer in the *Observer* points out, the principal danger in modern building arises from the use of iron. No system of fireproof construction is free from risk if it has to be sustained by girders and columns which are liable to be expanded by heat and broken by the action of water; and the evils of unprotected iron-work are not exaggerated in your article. To meet the danger we devised a system of encasing girders, which has been fully tested in this country. It was to this encasement that the safety of the stores belonging to the Civil Service Co-operative Society in the Haymarket was owing in the fire of April 23, 1881, which was described in the *Observer* of the day following. The part of the premises in which the fire arose was stocked with candles, oils, and soaps, brushes, turnery, and other combustible materials, and it required the aid of thirteen steam and two manual engines to overcome the flames. But our system of construction localised the fire; and although a large amount of stock of the kind we have described was destroyed, the building was preserved, and the business of the other departments was resumed without the loss of a day. All this, we think, may be accepted to prove that much can be done to diminish the fearful consequences of fires. It is true, as the article suggests, inflammable goods are always liable to destruction; but experience has shown that buildings containing them may be saved, and, therefore, that life may be secured. The interest of the subject will, we hope, excuse the length of this letter.—Yours, &c.,

DENNETT & INGLE.

5 Whitehall, London, S.W.: Jan. 19, 1883.

THE PRESERVATION OF CAIRO.

THE Committee of the Society for the Protection of Ancient Buildings invite the co-operation of all who are interested in the preservation of what remains of ancient Cairo. They believe that the time has come for active interference against a project of destruction which is ruinous to the country, and which is opposed to the wishes of the people. It may not be generally known that the project, only arrested by the late political events in Egypt, involved the destruction of entire streets and quarters of the town, which have been laid waste preparatory to the erection of modern buildings debased in style and totally unadapted to the climate of Egypt and to the wants of the inhabitants. The Committee suggest that the Government of the Khedive might be invited to enforce the abandonment of all schemes for the removal of native buildings except in cases that involved danger to the inhabitants, and this should be decided by competent judges. Native architects should be employed to rebuild the streets that have been destroyed but not restored, and this should be executed under the supervision of competent Europeans, who, having made Arab art their special study, would yet keep in view the requirements of modern civilisation—not, as some people imagine, necessarily at variance with a native style of architecture. The Committee are of opinion that some check should be imposed upon the wholesale removal of woodwork, inlaid marbles, tiles, and other objects, which, having been exported in large quantities to enrich museums and private collections, have now acquired a high commercial value, and thus offer a temptation to the owners to supply the numerous dealers who now flock to Cairo from London and Paris. Wherever casts, rubbings, or drawings could be made to supply the places of the real objects, these should be procured by the directors of our museums, who would find them almost as serviceable for educational purposes as the real objects. It would be unfair not to recognise the steps that have been already taken to insure the protection of the Arab monuments of Cairo, but such endeavours are apt to languish unless supported by public opinion in England, and the Committee earnestly hope that the sanction and encouragement of the English Government will be accorded to avert a calamity that would be regretted by the whole civilised world.

MR. HOLMAN HUNT'S NEW PICTURE.

MR. HOLMAN HUNT has explained the circumstances through which his new picture has been delayed. "It is," he says, "unfortunately true that the non-arrival of my materials when I was commencing this picture in Jerusalem led me to purchase a linen sheet there to serve as my canvas. For a small painting demanding but little manipulation this might have borne the strain of the work, but extra tension and accidental severe test of atmospheric condition gradually increased the difficulties arising from it, until even with the most cautious treatment, and consultations in England with the best authorities, no resources of my own proved competent to master the difficulty. Eight months since I gave the painting into the hands of an accomplished reliner to be placed upon a sailcloth of exceptionally strong texture, and otherwise for him to take steps to correct the evil. In many points this purpose was achieved most successfully, but in others, although the foundation was now firm as a rock, the original distortions of the upper canvas proved to be still of a character to defeat my utmost endeavours to complete the task. There were so many inducements to me to do my utmost to overcome the difficulty that I only adopted the resolution to abandon the attempt after too many efforts, and when it was obvious to all that to express any delicate meaning on the defective surface was an impossibility. Yet in speaking of my intention not to waste further time upon this canvas, I did not mean to convey the idea that the painting was 'irreparably spoiled.' Indeed, I shall not without further struggle abandon the hope of exhibiting the picture this season. The plan for the treatment of the existing difficulty, which my friend Mr. Millais has agreed upon with me, must necessitate destruction to more or less finished work. In view of this prospect I undertook an exact copy of the central group, and for possible eventualities I placed this upon the appropriate spot in a canvas suitably large for the whole picture. I have now so far advanced with the task that it is a question with me whether I shall not avoid further uncertain difficulties with the old canvas, and proceed with the duplicate to the end. In a few days I shall be able to decide this question. Whether sooner or later, however, I have no doubt that a new piece of cloth can be sewn into the space of the damaged Jerusalem canvas should this prove needful, and thus the picture may become sounder than most paintings on cloth, seeing that it will be firmly united to the sailcloth backing."

THE STATUE OF QUEEN ANNE.

AT the meeting of the Court of Common Council on the 18th inst. a correspondence was read between the Lord Mayor, the Dean of St. Paul's, and the first Commissioner of Works on the subject of the condition of Queen Anne's statue in front of St. Paul's Cathedral. The Dean, replying to the Lord Mayor's offer to co-operate with the Chapter in removing the unsightliness complained of, stated that the statue, with its accompanying figures, was, he believed, a public monument put up under an Act of Parliament by public money, and, therefore, not in the power of the Chapter to remove. There had been various communications with Her Majesty's Office of Works, but the office had not been disposed to deal with the monument. The Lord Mayor next wrote to the First Commissioner of Works complaining of the disgraceful and dilapidated condition of the effigy, and stating that the Corporation of London and the Dean and Chapter were equally anxious for the removal of the disfigurement to the cathedral, and would gladly co-operate with the Office of Works in any steps that could with that view be taken. Mr. Shaw-Lefevre replied that his department had no authority whatever over the statue and no power to repair or to remove it. In 1876 an application was made by the department to the Treasury for authority to spend 500*l.* in repairing the statue, but it was refused on the ground that it was not the property of the Government, and that the Act of 1854, which placed certain statues within the Metropolitan Police district under the control of the Office of Works, excluded the department from all jurisdiction over statues within the City of London. As that exclusion was made at the instance of the Corporation of London it appeared to him (Mr. Shaw-Lefevre) that the duty fell upon them of executing whatever repairs were necessary to the statue in question.

It was resolved that the correspondence be referred to the City Lands Committee for consideration, with power to confer with the Dean and Chapter of St. Paul's and the City Commission of Sewers on the subject, and with instructions to report without delay.

The St. Gothard Tunnel.—All attempts to effect an amicable arrangement of the matters at issue between the St. Gothard Company and Favre & Co., the contractors for the great tunnel, having proved abortive, the contest will be fought out in the law courts. The proceedings there, in the cross actions, are likely to be long and costly, the amounts at stake being, for Switzerland, unprecedentedly heavy. The company claim from the contractors nearly nine million francs, and the contractors, on their part, are suing the company for 14,350,000*fr.*, the amount of the losses which they say they have sustained by the company's *laches*.

The Model in the Law Courts.

SIR,—May I ask you to correct in your next number an erroneous paragraph published in *The Architect* this week? Therein it is stated that the full-size model of a man, now placed in the corridor of the Royal Courts of Justice, has reference to the proposed memorial to the late Mr. Street. I beg to inform you that the model has nothing whatever to do with the "Street Memorial."

Very sincerely yours,

H. H. ARMSTEAD, R.A.

Studio, Bridge Place, Eccleston Bridge, S.W. :

January 22, 1883.

[Several papers stated that the model represented Mr. Street. We suggested in the Note that somebody else was the subject, and it would show ignorance of Mr. Armstead's work to suppose that such a figure came from his studio.]

SIR,—The "full-size model of a man," which is referred to in your last number as having been placed in a corridor of the Royal Courts of Justice, has no connection whatever with the Street Memorial, which, in accordance with a resolution of the committee in May last, will be placed in the central hall. The committee feel every confidence that, in the hands of the distinguished sculptor who has been intrusted with the work, full justice will be done to the great architect and to his greatest achievement. I may add that the design and full particulars would have been before the public, and its execution well advanced ere this, had the subscriptions been as numerous and liberal as the committee hoped and had good reason to expect. Five hundred pounds are yet required to admit of the completion of the design according to the artist's conception. Surely such a sum ought to be readily forthcoming for such an object. Subscriptions may be paid to the hon. treasurer, Alfred Waterhouse, Esq., A.R.A., or the "Street Memorial Fund," London and County Bank, Hanover Square branch.

Faithfully yours,

6 Montagu Place,
Montagu Square, London, W.
January 23, 1883.

ARTHUR W. BLOMFIELD,
Hon. Sec. to the
Street Memorial Committee.

The Dublin Museum Competition.

SIR,—You have inserted a letter under the above title, without date or address, and signed "An Architect," in your paper of the 6th inst., which, with your permission, I propose to notice, not so much from any merit or suggestion in itself deserving of remark, but to prevent English architects being misled by the false statements of your correspondent, whose unlimited sneering at all things Irish may help to show the temper which such writing is sure to provoke. The same hand can be traced in some letters in the Dublin papers, and the last few lines show the personal interest of the "Architect" in the competition plans, if I am not much mistaken, and certainly no professional man ever took a more stupid or silly means to insult and outrage public opinion in Dublin than your nameless "Architect."

Commencing with the Corporation, "largely composed of publicans," who fear rival attractions to the gin-palaces, then a sneer at the Royal Irish Academy, "which has for many years kept its collections from the view of the public" (this is a false statement), then the Royal Dublin Society "claiming the chairs and tables of the council-room"—surely, sir, this is not the style to win respect from clients, and it must be remembered that the citizens of Dublin have as much right to a voice in this competition as a private gentleman who employs an architect to build a house. Dublin is the capital of Ireland, and its population is over 500,000; and the leaders of all shades of opinion have agreed at several public meetings that they are not satisfied with the site or the design submitted for the new museum buildings, which are to cost 100,000*l.*

If such meetings were held in any other city in the world, I care not where, there would be an end to the discussion, as the clients would dismiss the architects, compensating them for their trouble certainly and liberally. But unfortunately Englishmen have the idea that Irishmen must be bullied and insulted even when a kindness is intended, and this nameless "Architect" is evidently a John Bull of this type; but we will have none of him, or his gloomy plans, or his sneering letters. As to being "liberal with other people's money," I cannot see the point of the taunt as applied to the Dublin Committee; and a little consideration will show that the Dublin Committee have a perfect right to hold a high hand in the discussion. They are the leading men in the Royal Dublin Society, the Royal Irish Academy, and the Corporation of Dublin, representing the culture, wealth, and the popular voice of Dublin; and they are supported by the Dublin

press of all shades of politics, and they are unanimous in condemning site and plans.

Now as to other people's money. Why other people's? Dublin has been cheated out of its parliament and has been cheated out of its museum for the last twenty-five years. Edinburgh—exactly in the same position as Dublin as a centre of teaching—has had its museum this twenty-five years, at the cost to the country of 100,000*l.*, and Irish taxpayers contributed, as they do now, to South Kensington, and the Government has promised Dublin this museum since 1865, and we taxpayers of Dublin are waiting till for our share of Imperial expenditure and fulfilment of Government promises which take generations to be carried out in Ireland; and because, forsooth, we object to see one of our finest city squares destroyed by an "ugly building with an arch in the centre," and want the expenditure of a few thousand pounds in the purchase of some old houses to clear a proper site to give light and air to two buildings instead of one, we are to be insulted as Irishmen by every nameless scribbler who reads a few Blue-books, and imagines he alone is a wise man on this subject.

I am, faithfully,

RICHD. W. WALSH, C.E.

Alverno, Dalkey:

January 17, 1883.

The Decoration of the Internal Dome of St. Paul's.

SIR,—The official interference, at a late meeting of the Institute, with the discussion of this subject appears to me, and some other subscribers to the decoration fund, to have been so undesirable that it may be worth while to revert to the subject. The plea for silence was claimed upon the fact that the design (based on the sketch of the late Mr. Stevens) had not yet been finally approved by the committee. Something, but not very much, is known of this design, and what is known of it most certainly does not command anything like general approval; and if the authors should succeed in obtaining the acceptance of it by the committee, the matter will be ended as far as we and the public are concerned. It is clear, then, that if further discussion is really desirable and is to have any practical result, now is the time to enter upon it. Later on we should be met with the cry, "Too late, too late." As it has taken about ten years to arrive at the present indefinite state of things, we must conclude that the committee and all concerned find the problem they have to deal with one of unusual difficulty. This is not very surprising, for the work—a truly national one—will be of such unusual magnitude and such unusual form that all the aid that can be secured should, I think, be rather welcomed than declined. The safeguards that the Cathedral surveyor claimed as sufficient to secure a satisfactory result do not appear to be of much practical value, when we consider the past history and present circumstances of the question, advisers and committee appearing to be in a difficulty from which they cannot emerge: a difficulty no doubt arising from the number and complexity of the questions—scriptural, iconographic, archaeological, and others—which present themselves for consideration in determining merely a basis or principle for the work. To convince ourselves of its unusual character, we have only to ask what has actually been done of a similar nature by any living British artist, and we can only reply—nothing! The President's beautiful picture at South Kensington, large as it is, is a trifle in comparison.

Taking all the circumstances into account, it is scarcely surprising that disappointment should be felt. Ten years have elapsed since the committee first met, but next to nothing has been done in the decoration of St. Paul's. Subscribers may well despair of seeing anything in their lifetimes.

Your obedient servant,
X.

LEGAL.

High Court of Justice—Queen's Bench Division.

Before Mr. Justice LOPES.

DIPLOCK & HAMILTON v. HARTLEY.

"PICKED" GRANITE.

This was an action to recover the price of a number of granite blocks. The defence was that the blocks were not in accordance with the contract. Mr. Kemp, Q.C., in opening the case, stated that the plaintiffs were stonemasons, carrying on business as the West of England Granite Company at Penrhyn, and the defendant, Mr. Job Hartley, was a builder at Small Heath, Birmingham. Towards the end of the year 1880 the defendant contemplated entering into a contract with the London and North-Western Railway Company, and he communicated the fact, though not the details, to the plaintiffs, from whom he desired to obtain the granite required under the contract, and applied for the lowest quotations. Considerable correspondence ensued, and in May, 1881, a gentleman, acting for the defendant, concluded a contract, one of the terms of which was that the top face of the stone should be dressed, but the remaining faces picked only, the understanding being that the sides of the granite bases would not be exposed to view. It would appear that the defendant gave the railway company the right to reject any of the blocks, and as a matter of fact they did reject some of them, and the question now was

whether the blocks supplied by the plaintiffs were in accordance with the terms of the contract. He (Mr. Kemp) was instructed that the word "picked" meant a variety of things, according to the nature of the work, and he would prove that the blocks in question were picked within the meaning of the contract, and if so, whatever might be the contract between the defendant and the railway company, the plaintiffs were entitled to be paid the 90*l.* still remaining due. The defendant claimed a number of items by way of counter claim, but if the plaintiffs were right as to the contract, it would not be necessary to enquire about the items. If, however, it became necessary to enquire into the question of "picking," it might be expedient to refer the matter, though he was bound to say that his experience was that a partial reference of that sort generally involved a trial of the whole case twice over. Mr. Justice Lopes thought that under those circumstances it was advisable to refer the entire matter at once. Mr. Clarke, Q.C., remarked that the counter claim was for the expense which the defendant had been obliged to incur in order to have the granite picked after it was delivered. Counsel held a consultation with regard to his lordship's suggestion, and at its conclusion Mr. Kemp announced that it had been agreed to enter a verdict for the plaintiffs for 90*l.*, subject to a reference under the Common Law Procedure Act. Mr. Clarke observed that there would also be a verdict for the defendant on the counter claim subject to a reference. That, of course, was only formal. The agreement was that the reference should be to a learned counsel, who would have power to dispose of all matters in dispute. Order accordingly.

(Before Mr. Justice STEPHEN.)

NORTHERN FOUNDRY COMPANY v. KING & BROWN.

AGENTS' ORDERS.

The plaintiffs in this case were ironfounders at Falkirk, and the defendants were builders at Hampstead. The defendants were erecting a number of villa residences, and required iron railings for forty of the houses and a large central garden. The order for the railings was given to the London agent of the plaintiffs' company by a Mr. John Jones, and the case for the plaintiffs was that that gentleman was acting as agent of the defendants. The railings were supplied to the defendants, but they refused to accept a portion of them. The plaintiffs alleged that this refusal arose from the fact that the defendants had ordered more railings than they actually wanted, and they accordingly brought the present action for the purpose of recovering a sum of 52*l.*, the value of the railings which the defendants had declined to take. The defendants, on their part, asserted that Mr. Jones was in no sense their agent, and further, that they never gave any order for a specific number of railings. The agent gave a specific order on his own responsibility, and with the result that a larger number of railings were supplied than they really required, and defendants maintained that they could not be legally called upon to pay for the excess, their intention having been throughout to have the railings as they required them. In the end Mr. Justice Stephen nonsuited the plaintiffs, with costs.

Court of Session, Edinburgh.

(Before the Lord-Justice Clerk and Lords YOUNG, CRAIGHILL, and RUTHERFORD CLARK.)

BIRRELL v. ROUGH.

ARCHITECTS' CERTIFICATES.

This was an appeal from a judgment of the Sheriff of Fifeshire in an action at the instance of John Rough, joiner in Kirkcaldy, against Alexander Birrell, for payment of 153*l.* 5*s.* 3*d.*, being the alleged balance due to the pursuer of the contract price and extras in connection with the joiner work of a tenement of houses belonging to Birrell. It was provided by the specification that the contract price was to be paid by certain instalments, the last of which was to be paid when the tenement "is finished and certified by the architect as conform to plans, specifications, and general conditions." The defendant pleaded, in defence, that Mr. Storrar, architect, Cupar, who was employed by him to superintend the work, having refused to grant a certificate that the work was properly finished, the action was premature, and ought to be dismissed. The Sheriff-Substitute, after the record was closed, remitted to Mr. Andrew Scobie, architect, to report whether the joiner work had been duly executed in terms of the specification; and he at the same time allowed a proof with regard to the extra work, in the course of which Mr. Storrar was examined as a witness by the defender. Mr. Scobie reported that "although not in every particular executed according to the specification, the job is executed according to the spirit or fair interpretation thereof, and in such a manner that an architect wishing to deal fairly between the proprietor and contractor should have no hesitation in passing as satisfactory." The Sheriff-Substitute thereafter held that the pursuer was bound by the clause of reference in the contract, and sisted the process to enable the pursuer to take such steps as he might be advised to obtain Mr. Storrar's certificate. In his note to the interlocutor, the Sheriff-Substitute stated that he had come to this conclusion reluctantly, for he was convinced that the pursuer had substantially performed his part of the

contract, and it was difficult to resist the impression that he had not been fairly dealt with. On appeal to the Sheriff, his Lordship recalled the Sheriff-Substitute's judgment, and decreed against the defender for the balance of 133*l*. 13*s*. 6*d*., with expenses. His Lordship based his judgment on the ground that Mr. Storrar had disqualified himself from acting as referee by his evidence as a witness for the defence, and that this ground of decision was equally applicable to the duty which he had to perform of granting a certificate that the work had been completed. The defender appealed.

The Court affirmed the Sheriff's decision, with expenses. Their Lordships held that the defender had acquiesced in the remit to Mr. Scobie, and that the report of that gentleman sufficiently instructed that the work had been completed in terms of the contract, and that there was, therefore, no good ground on the part of the defender for withholding payment of the balance of the contract price.

ENGINEERING WORKS.

Dock and Railway Works at Hull.—On Tuesday a keel-post stone weighing eight tons was laid at the Alexandra Dock, which is in connection with the new line to Barnsley. The works of both dock and railway were commenced early in 1881, and it is expected that the railway will be completed by the end of the present year, and the dock by the end of 1884. Some idea of the extent and magnitude of the works may be gathered from the following figures:—The excavations on the railway amount to 5,000,000 cubic yards, those of the dock being 3,500,000 cubic yards, giving a total of 8,500,000 cubic yards. Of this quantity 4,700,000 cubic yards have been done up to the present time. There are five tunnels on the railway of an aggregate length of 4,263 yards. The ironwork on the railway bridges weighs 5,800 tons, of which 2,000 tons are already in place. The quantity of brickwork already executed is 96,000 cubic yards, involving the use of 36,000,000 bricks. Of the masonry in the dock there will be 435,000 cubic yards, of which 110,000 cubic yards are already done. There are 728,000 cubic yards of dredging, of which 140,000 yards have been done. The number of men employed on the dock is 2,400, and on the railway 3,800, making a total of 6,200. In November last the total number was 6,800. Of engines and machines there are employed on the railway and dock works sixty-five locomotives, eighty portable engines of 874 horse-power combined, forty-seven steam cranes, eight steam navvies, two hydraulic navvies, three steam grabs, twenty-one steam pile engines, two steam dredgers, and three electric light machines. These latter are in the dock works only; they are on the Siemens principle and supply the current to six lamps of 3,000 candle-power each, and ten lamps of 600 candle-power each. The smaller lamps are carried on portable stands, and are moved about from place to place to suit the requirements of work. Of horses there are thirty employed in the dock, and 140 on the railway, making a total of 170. The total number of earth waggons employed is 2,670, the railway requiring 1,764, and the dock 906 of that number. The cost of the combined undertaking is estimated at three millions sterling, but the company have powers for raising another million of capital. The engineer-in-chief is Mr. J. Abernethy, and the contractors are Messrs. Lucas & Aird. Mr. W. Colson is the contractors' agent for the dock.

CHURCH BUILDING AND RESTORATION.

Charnwood Forest.—The Oaks Church, which is situated in a secluded valley almost in the centre of the forest of Charnwood, is being restored under the direction of Mr. Ewan Christian. When the work is completed the church will afford accommodation for some 200 persons. The contractors for the work are Messrs. Herbert, of Leicester, the contract price being about 3,000*l*.

Owermolgne.—The parish church has just been reopened. The church, with the exception of the tower, which is in a comparatively good state of repair, has been rebuilt. The church consisted of nave, chancel, and transept. A vestry has been added. The style was of two or three periods in date, the Perpendicular being followed in the restoration. The work has been carried out by Mr. John Beer, from the plans of Mr. S. Jackson, of Weymouth.

Nether Broughton.—Some further works of restoration have been effected at Nether Broughton Church. Two of the old bells have been re-hung, and the remaining one, which was cracked, has been replaced by a new bell weighing 9 cwt. New bell-frames, wheels, and beams have also been provided by Messrs. Taylor & Son, of Loughborough. New oak louvres have been placed in the tower windows, and the old floor in the bell-chamber has been replaced with a new oak floor, and a new pitch pine floor has been substituted for the old floor in the ringers' chamber. A new roof has been placed on the tower and covered with lead. These and other works have been carried out by Mr. Allen, builder, of Old Dalby, under the superintendence of Mr. William Knight, architect, of Nottingham.

NEW BUILDINGS.

Children's Hospital, Glasgow.—This hospital has been opened. A mansion-house has been enlarged and altered for the purpose, under the direction of Messrs. Campbell Douglas, & Sellars. The exterior of the building is unpretentious, but the Scott Street entrance has been embellished by a finely-executed representation of Charity, supported by cherubs. The main entrance-hall has been finished in a quiet but effective style of decoration. To the right of the entrance Ward No. 1 is situated, the arrangements of it and those on the two upper flats being very much alike. The floors are of pine, varnished, and the walls to a height of six feet are covered with cream-coloured tiles, and above that finished off with enamelled paint of a tint which will not be too trying to the eyes of the patients. The lower parts of the windows of each ward have been filled with painted glass, the centre designs illustrating well-known nursery legends. The fireplaces are so constructed that a current of heated fresh air is being constantly sent into each apartment, but in addition to this there is an ordinary heating apparatus. All the pipes of the plumber-work throughout the house are exposed. The principal staircase-window has been filled with a beautiful stained-glass work, representing Christ blessing little Children, which was executed by Messrs. Sprigley & Hunt, of Lancaster and London.

GENERAL.

Mr. J. Earnshaw has been appointed architect for new Wesleyan Chapel and Schools at Bridlington.

Mr. R. Ferguson, M.P., of Carlisle, has been elected a Fellow of the Society of Antiquaries.

Mr. W. G. Penty delivered his presidential address last week to the members of the York Architectural Association.

Mr. W. Atkinson, of Stockton, has taken the contract for the additions to the prison buildings at Northallerton.

Mr. G. Courtauld, M.P., has offered to erect a Cottage Hospital at Halstead, at a cost of about 1,500*l*.

Mr. Wykeham Martin has presented a polished brass eagle lectern to Leeds Church, near Kent. It was made by Messrs. Jones & Willis.

Mr. James Salmon, F.R.I.B.A., delivered a lecture on Tuesday to the members of the Glasgow Architectural Association upon "Architectural Education." The founding of professorships of architecture in the Universities was recommended.

A Pier and Marine Promenade are to be constructed at Mablethorpe, Lincolnshire.

The Contract for the material of the Forth Bridge, which is to be constructed entirely of steel, has been given to the Steel Company of Scotland, Glasgow.

The Picture representing *The Daughters of Israel lamenting over the Death of Saul*, by Mr. H. Le Jeune, A.R.A., has been presented to the Longworthy Art Gallery, Salford, by an ex-Mayor of the town.

A Column in the arcade of Kelso Abbey has fallen. Steps are being taken to prevent further damage, which threatens to follow.

The London Sanitary Protection Association had a total number of 540 members for the year 1882, the year's income amounting to 1,164*l*.

The Parish Church of Newport, Salop, is to be restored. The cost of reinstating the building in a condition of safety will be about 2,000*l*.

The Birmingham Corporation, who obtained borrowing powers for 2,000,000*l*. for their gas undertaking, have made application for sanction to borrow a further sum of 250,000*l*.

The Restoration of the chancel and eastern portion of Aston Church, carried out at the cost of an anonymous benefactor, is nearly completed, and it has now been decided to undertake the restoration of the old nave and aisles.

The Army Estimates will include 11,000*l*. for levelling the trenches and other obsolete fortifications around Devonport; and 8,000*l*. for similar work at Plymouth Citadel, where new barracks will probably be built.

Mrs. Bray died a few days ago, in the ninety-third year of her age. She was married in 1818 to Charles Stothard, the archæologist, a son of Thomas Stothard, R.A. With him she visited the old towns of Normandy and Brittany, and soon afterwards published her first book, a series of animated letters descriptive of her tour. Charles Stothard was killed in 1821 by a fall from a ladder while making a drawing in Beer Ferrers Church, in Devonshire. With the assistance of her brother, Mr. Alfred John Kempe, himself a distinguished antiquary, she edited her late husband's incomplete work on the "Monumental Effigies of Great Britain," and in 1823 published his memoirs. Mrs. Bray also wrote a life of Thomas Stothard, which was originally published in *Blackwood's Magazine*. Mr. C. Stothard's beautiful collection of original drawings for the "Monumental Effigies" has been left to the British Museum.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JANUARY 27, 1883.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested, as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

Lithographers, Engravers, and Printers, 22 Martin's Lane, Cannon St., London, E.C.

BILLS OF QUANTITIES, SPECIFICATIONS, REPORTS Copied or Lithographed with rapidity and care.

SPRAGUE'S "INK-PHOTO" PROCESS FOR REPRODUCING COLORED DRAWINGS OR PHOTOGRAPHS.

PLANS OF ESTATES, with or without Views, tastefully lithographed and printed in colours.

PHOTO-LITHOGRAPHY.

CERTIFICATE BOOKS for Instalments, 3s., or with receipt, 5s. Bill Paper, 17s. 6d. & 25s. per ream. SPRAGUE'S TABLES, upon application.

SILICATED CARBON
MAIN-SUPPLY FILTER.

FOR FILTERING THE WHOLE OF THE WATER-SUPPLY OF A BUILDING BEFORE USE Complete ready for fixing, from £8 0s. each.

SILICATED CARBON FILTER CO. BATTERSEA, LONDON, S.W.

CHIMNEYPIECES, TILES, STOVES, &c. Large Selection. Good Designs. Moderate Prices. Architects and Builders invited to send their Clients to inspect.

WILKINS & SONS, 89-92 Pentonville Road, N.

THE PATENT VACUUM
CHIMNEY-TOP AND VENTILATOR

Is now recognised by all the leading Architects and Builders as the Best and Cheapest means for curing DOWN DRAUGHTS, as well as for the Ventilation of Drain and Soil Pipes.

R. ETZENSBERGER & CO.

13 ST. ANDREW'S STREET, SHOE LANE, E.C.

MATLOCK.

For Erection of Pavilion for the Matlock Bath Pavilion and Gardens Company. Mr. JOHN NUTTALL, Architect, Matlock Bridge. Quantities by Mr. F. S. SMITH, Surveyor, 14 St. Ann's Square, Manchester.
Chadwick & Co., Rotherham £5,200 0 0
Thirteen tenders sent in.

For a Pair of Villas on Matlock Bank for Mr. E. Slack. Mr. JOHN NUTTALL, Architect. Quantities by Mr. F. S. SMITH, Manchester.

Fox, Wirksworth, Derby £1,100 0 0
Wildgoose, Matlock Bank 1,094 0 0
ASKEW, Matlock Bridge (accepted) 1,070 0 0

SWINTON.

For Erection of School at Roman Terrace, Swinton, for the Swinton School Board. Mr. H. L. TACON, Architect, 11 Westgate, Rotherham.

Holmes, Sheffield £1,750 9 7
Broadbent, Goldthorpe, near Rotherham 1,675 0 0

The Architect.

THE GROUND LINE IN ARCHITECTURE.

BUILDING artistically designed may be said to present to the view of the observer, and, of course, to the contemplation of the critic, four elements of merit or demerit—the sky line, the surface, the substance, and the ground line. The composition is not a complete work of art unless all of these have been duly considered. By the sky line we mean the summit out-

line; by the surface, the treatment of what is now very often called detail; by the substance, the identification of the surface-work or detail with the construction; and by the ground line, the connection of the upright mass with the ground. The treatment of sky line, in the hands of an accomplished designer, with a good opportunity, whether in picturesque work or in Classic, if not often managed so well as it might be, is at any rate a recognised task.

The treatment of the surface of the building is, as everyone knows, too frequently regarded at the desk as the only thing to be seriously studied. The question of substance and development is as yet—we speak of modern times—one of theory more than of practice; although, no doubt, some of our best mediævalists, and especially the younger men, have learnt to do a good deal of honour to the principle. But when we come to look at the ground line, there is in almost all cases an absence of merit which, whatever reasons may be assigned for it, is a defect that deserves to be understood and fairly encountered.

One of the favourite modes of indicating the contrast between Classic architecture and Gothic, is to say that the one is horizontal in principle and the other vertical. The leading lines, that is to say, in the Classic style, when characteristically handled, lie level in such a way as to suggest breadth and repose, while in the Gothic they strike upwards, not necessarily with the reverse of repose, but in the spirit of aspiring form. Certain enthusiasts may be excused for suggesting that the one is of the earth earthy, and the other more a thing of the heavens; but this is a play upon words, and is only to be quoted for the sake of accentuating the contrast. It might be a sufficiently fair retort on the part of other enthusiasts to point to the circumstance, as they can certainly do with confidence, that the best Classic examples, especially those of antiquity, lay hold of the earth, or rise out of it, artistically—with a proper ground line—whilst the ordinary specimens of Gothic seem to have sunk a little into the ground, sometimes over their ankles. The question, as regards detail of composition, is primarily one of stylobate or general base. In modern Classic architecture the principle is of the very greatest interest and importance; in modern Gothic, also, we cannot admit that it is a thing to be overlooked.

The stylobate of the ancient Greeks, it will be remembered, in its most characteristic form, consisted of three simple steps. Upon this the order or colonnade so stood as to represent a slightly sloping or battered surface, becoming quite vertical in the entablature until the overhanging cornice completed the profile. The typical Egyptian profile, on the other hand, as the precursor of the Greek, comprised a plain wall-surface considerably battered, with a massive hollow crown-moulding or cornice, and no stylobate. In both cases the effect was the same in principle: the profile was virtually a curve ascending from the level ground and reversing or turning outwards at the summit—in fact, an extremely flat equivalent for the moulding which used to be called a *scotia*.

In the Greek the stylobate was especially necessary in this view, because the inclination or batter of the upright face was so slight; in the Egyptian this was generally so considerable that a stylobate does not seem to have suggested itself, although no doubt it might be pronounced a refinement to introduce one. In the Greek, again, the large scale of the curve produced at the ground by the stylobate rendered a much less pronounced return at the summit

sufficient to satisfy the eye; whereas in the Egyptian the small scale of the curve at the foot seems to have required a larger return at the head. The Riccardi palace at Florence, and the Farnese palace at Rome, may be cited as somewhat similar instances to the Egyptian; whilst in a thousand cases of modern design the Greek principle of the small cornice is entirely misapplied, because there is no stylobate at all to produce the necessary curve at the ground.

In the pretty Gothic monuments called Crosses, the value of a spreading base is often exceedingly well shown. But here, and indeed in all pure Gothic work—the Flemish town halls, military castles, and the like, excluded—the overhanging summit or crowning projection is absent. The profile thus becomes pyramidal, and the great inclination of the upright line assists this effect and is aided by it. It may therefore be contended that no stylobate is necessary in Gothic work—that the pyramidal outline rises abruptly from the level ground and terminates in a point at the summit appropriately enough. To meet this argument it is only necessary to refer again to the Crosses; for even in the most verticalised of Gothic *motifs* the stylobate is at least an extra grace.

In the small number of conspicuously detached edifices which we permit ourselves the extravagance of achieving in English towns—London especially—it may be safely said that a proper stylobate, or spreading base, ought never to be omitted. Even if the academical reasons were not strong enough, there is something in the sturdy English character which seems to point to this form amongst others of securing a good sensible foothold. In matters structural it is by no means an unwise maxim to take care of the foundation and the building will take care of itself; so also in the artistic part we may say—take care of the base (and the sky line) and the details of effect will give much less trouble. If we may offer a familiar illustration, there can be no doubt that many of the West-end streets of London owe more of their dignity to the area balustrade than to anything else. Although this feature may not be by any means adjusted in its proportions to the purposes of a stylobate, and although the wall-face of the edifice itself extends only too visibly downwards to an undefined depth within the fosse behind them, yet it is not to be denied that the mere pretence of a podium, which the enclosure of the area supplies, has in the aggregate effect of the street a satisfying influence, which the appearance of a row of similar houses without areas, rising sheer upright from the ground, does not possess.

In the open country, and especially in the case of large residential mansions, the question of the fit connection of the house with the ground takes a special form, and acquires a peculiar importance. On the garden front or fronts there ought in perhaps every possible case to be a terrace or its equivalent. Sometimes this will be prominent in appearance, and sometimes it will be little more than a broad path. In the latter case it may at least be elevated above the lawn level a foot or two, and the raised platform thus created may be edged with a curb; this will be quite sufficient to constitute a foothold.

When a more stately and more elevated terrace has to be made, it may require careful treatment to keep its effect within the limits of proportionate scale. In either case, however, the idea of causing the house to rise gracefully from the ground level is directly involved, and ought to be duly developed. On the entrance front the case is different, at least when the carriage drive, as is generally the case, carries the ground level close to the floor line. But still the importance of a stylobate ought not to be overlooked, and the treatment ought to be such as shall satisfy the eye.

As regards the point of construction, if we should be asked how a projection of one or two feet, or even more, is to be made without the expense of carrying the extra thickness of wall down to the foundation level, the answer must be that to that level it must go, that the building will be all the better, and that the extra money will be well spent. A little more substance in our foundations—possibly only in concrete—need not be objected to in these days, when one has to consider not only the possibility of a subsidence, but the contingency of the construction of sewers and railways in the neighbourhood. The most common obstacle to the introduction of such a stylobate in streets, namely, the waste of ground, is much more serious; but even this difficulty is capable of being fairly met if the architect knows how to make up for deficient projection by a judicious management of height.

ANCIENT EGYPTIAN ART.*

THE interest in ancient Egypt never ceases, and each generation tries to solve the problem of existence there in its own way. Our knowledge of Egyptian life is in some respects apparently clear and definite, but as regards the most important matters we continue to be in a darkness that may well be called Egyptian. By means of art we seem to be acquainted with Egyptians of all classes, from the king in his war chariot who always overcomes his enemies, and is always young, to the idle boys who have been sent with messages to the priests; glimpses are given to us of ladies at their toilets, and of the cooks at the kneading-trough; we see the tax-collector using his stick "to wring from the hard hands of peasants their vile trash," and the scribe with his eye fixed on the speaker ready to write from right to left; the painters, sculptors, and polishers of stone, the tumblers, dancers, and musicians, and the mourners who perform at funerals, appear before us, and it is possible in imagination to follow the pursuits of the husbandman or the smith, and join a crocodile hunting-party on the Nile. The cosmetics which were used to give brilliancy to eyes that have long been dim, the toys which parents purchased for their children, the draughts by which time was wiled away, amulets, wigs, painters' brushes, white-washer's pails, the very flasks that held the oil to sharpen tools are to be seen in almost every museum. But, in spite of all we have before us, Egyptian life under the Pharaohs continues to be no more than the baseless fabric of a vision. Little or nothing is known to us of the thoughts and words of the people. Much labour is expended on the deciphering of inscriptions and scrolls; but the result, however interesting, is not more suggestive of reality than the epitaphs on modern monuments. There is, for example, an inscription on the tomb of an inspector of works at Gournah, which has been translated as follows—"The chief taskmaster says to the builders, 'Work actively with the hands, be not idle, let there be no giving-in.'" Can we believe that the energetic overseers we see in the paintings spoke in so didactic a manner as they flourished their whips or knotted sticks? Much fewer words we may be certain were used, and it is not improbable that then, as now, many oaths were heard, although they were not recorded on the walls of the galleries. But for a long time the Egyptians were supposed to live under marvellous social and political conditions, and the practical test of probability was not applied to what was recorded of the people. Everything was accepted as being as mysterious as the reign of the gods in the Nile valley, which, according to MANETHO, lasted 13,900 years.

It would be strange if Egypt escaped the scepticism of the nineteenth century. Absurd as was the theory of COLERIDGE, who was of opinion that everything of importance in ancient Egypt was derived from Greece, it was an expression of revolt against the fantastic legends which were supposed to be historical truths. Since his time many other credulities have been questioned, and on more rational grounds. It was, for example, accepted as an article of faith, that conventionalism was supreme in Egypt for ages, and, in consequence, there was no variation in the figures which were painted and sculptured, according to the hieratic canons. This faith was expressed in the dictum of RAOUL-ROCHETTE, viz.: "From the first of the PHARAOHS to the last of the PTOLEMIES the art of Egypt never varied." It is true that there were canons by which art was regulated, but it is evident that there was also much freedom. If conventional figures are alone considered, the Egyptians will appear to have been subjected to that kind of despotism which is most intolerable to the mind of an artist, for when he is not permitted to express his own individuality, an artist's powers become torture. But the existence of so many figures which do not seem to have been mechanically formed according to fixed proportions, and especially the portrait statues, are enough to show that although a sculptor may have been taught under the priests, or other established arbiters of taste, in the course of his career he was free to represent what he saw. The hieratic canons were to him little more than academic rules are to modern artists.

It will be evident, from what we have said, that there are more ways than one of looking at the life and art of the Egyptians. Hitherto people have believed there was but one

stand-point, from which everything seemed to be as much a matter of prescription as the figures which were blocked out in squares on some of the temple walls. But this is not how M. PERROT or M. CHIEPIEZ regard Egypt. They do not consider that it was the China of antiquity, or that the people were averse to teach those with whom they came in contact. Egypt is to them a remarkable country, but one about which much may be understood if the principle of common sense is applied to the buildings, statues, paintings, and other works which still remain. Their interest in the country arises from the fact that they are historians of Greek art rather than Egyptologists. To write that history, there must be a beginning, and where is it to be found if not in Egypt? Prehistoric, Indian, Assyrian, Japanese, Persian, and other forms of art have interest, but it would be an endless task to explain their relations to the art of Greece.

The first volume contains four chapters on the General Character of Egyptian Civilisation, the Principles and General Characteristics of Egyptian Architecture, Sepulchral Architecture, and the Sacred Architecture of Egypt. In the second there are six chapters on Civil and Military Architecture, Methods of Construction, Sculpture, Painting, Industrial Arts, and General Characteristics of Egyptian Art. It will be evident that a large part of the book is devoted to the consideration of architecture, and the authors' explanation of the reasons which induced them to give such prominence to one branch of art is as follows:—

The apparent disproportion is justified by the place held by architecture in the Egyptian social system. We have proved that the architect was socially superior to the painter, and even to the sculptor. His uncontested pre-eminence is to be explained by the secondary rôle which sculpture and painting had to fill. Those arts were cultivated in Egypt with sustained persistence; rare abilities were lavished upon them, and we may even say that masterpieces were produced. But plastic images were less admired in themselves; their intrinsic beauty was less keenly appreciated in consequence of the practical religious or funerary office which they had to fulfil. Statues and pictures were always means to an end; neither of them ever became ends in themselves, as they were in Greek works, whose final object was to elevate the mind, and to afford to the intellectual side of man that peculiar enjoyment which we call æsthetic pleasure. Such conditions being given, it is easy to understand how painters and sculptors were subordinate to architects. It was to the latter that the most pious, and, at the same time, the most magnificent of kings, confided all his resources, and his example was followed by his wealthy subjects. It was to him that every one employed had to look as the final disposer; the other artists were no more than agents and translators of a thought which was grasped in its entirety by the architect alone. His work, embellished with all the graces of a decoration which reckoned neither time nor materials, formed a homogeneous and well-balanced whole. It was in inventing, in bringing to perfection, and in contemplating such a work that the Egyptian mind gave itself up most completely to love for beauty. If we take an Egyptian building in its unity, or the product of a combined effort on the part of a crowd of artists labouring under the directing will of the architect, we shall no longer feel surprised at the space demanded by our study of his art.

This extract will suggest the character of the two volumes. The authors' desire is that their work should become the sort of guide for Egyptian art that the works of WINCKELMANN and O. MULLER are for Greek and Roman art. Although there are already many elaborate volumes by foreign authors on Egypt, MM. PERROT and CHIEPIEZ have found in none of them the kind of information which they considered to be requisite for a work on Egypt that would be adapted to the modern spirit. In the plates especially there are many shortcomings; they are beautifully executed, but are not remarkable for accuracy. When, for instance, M. CHIEPIEZ tried to prepare drawings which might suggest the original appearance of the great temples, he found it to be impossible to give coherence to the representations of a building by various artists, and in consequence much labour was requisite to prepare the restorations that are given in the volumes. We mention this in order that it may not be supposed that the volumes are only compilations. Freshness is hardly a word that seems applicable to anything relating to Egypt, but no other is so suggestive of the character of the work of MM. PERROT and CHIEPIEZ. Even in the illustrations, although the subjects may be familiar, they are presented in a new aspect or with more attention to details than may be found in older books. Advantage has been taken of the latest *recherches*, and it must be owned that French archaeologists have won their greatest victories in Egypt. French writers have acquired a reputation

* "A History of Art in Ancient Egypt," from the French of Georges Perrot and Charles Chipiez. Two vols. Translated and Edited by W. Armstrong. Published by Chapman & Hall (Limited).

for their skill when treating of an abstruse subject, and it would be hard to find a better example than this work on Egyptian art. Mr. ARMSTRONG'S translation is very pleasant reading.

The illustrations (of which there are about six hundred in the text, besides steel and coloured plates) demand some notice from us. The majority of those relating to architecture appear to have been drawn by M. CHIEZ, and if his name had not been attached to them they would have been taken for the work of the late VIOLET LE DUC. They have the fine lines of the blocks in the "Dictionnaire" and so many other volumes, which appear to have been produced by a needle rather than a pencil, and they indicate a similar delight in grappling with difficult problems in perspective. In the restorations, VIOLET LE DUC'S method of giving birdseye views and introducing a great deal of surrounding country has also been adopted. The sculpture and paintings are mainly by MM. BOURGOUIN and ST. ELME GAUTIER, and show the facile skill of modern illustration. As a rule the sizes of the original figures are given—a rule which should always be observed in giving representations of ancient art.

THE AUSTRIAN EXPLORATION OF LYCIA.

REPORTS had been heard from time to time of insurmountable difficulties attending the Austrian exploring party led by Professor BENNDORF in Lycia. It was even hinted that what they had found was not worth all the trouble. It is therefore with pleasure that we welcome the preliminary report just issued, in which the gains are set forth not without indication of the arduous labours they had entailed. The result, it may here be stated, is not a new chapter in the history of Greek sculpture, but it affects very largely a series of sculptures in which English students are or ought to be interested—the sculptures of the Nereid monument, as it is called, which Sir CHARLES FELLOWS brought home to the British Museum from Xanthos in Lycia. Possibly some may regret that England had not completed her work there. Yet it is so far satisfactory that the sculptures will now be seen in Vienna instead of in a wild, deserted, and almost inaccessible region, where only one or two Europeans had ever succeeded in visiting them.

The liberality and spirit of the Austrian Government may be judged from the fact that an extensive series of excavations in the island of Samothrace had only been concluded when preparations were commenced for a new venture, under the direction of Professor BENNDORF and a well-known architect, M. NIEMANN, both of whom had been engaged in the Samothrace expedition. Having decided on Lycia, their first measures were to make themselves personally acquainted with everything that had been brought from that quarter to this country. The next step was a preliminary visit to Lycia to see where the most promising field would be for their operations. The conclusion arrived at was to concentrate all efforts on the ruins of a great monument at a place called Gjölbaschi, near the ancient Kyaneae, lying at about 1,800 feet above the sea level, and approachable only with great difficulty. In the following spring (1882) Professor BENNDORF and his party set out, the Government vessel *Taurus* being appointed to assist them. The firman obtained from the Porte was for two years, with a right to a third of what was found. A notion of the scene when the party arrived at the ruins may be gathered from Professor BENNDORF'S words:—

Running on in advance, I worked my way breathlessly through the dense prickly brushwood and among the rocks up to the entrance doorway, which opened in the wall, a considerable distance from the ground. Without pausing at what I saw first, and which only intensified expectation, I clambered up by means of the joints of the wall on to the threshold, and instantly was confronted in the interior of the ruin with a mass of sculptures which, overshadowed by tall trees and to some extent concealed by luxuriant vegetation, presented in the splendour of the setting sun a marvellous picture. I confess that I rank among the deepest impressions of my life these moments of beholding a long-desired aim now happily attained—beholding it in the silent and solemn stillness and isolation of a vast scene of nature, the view extending over a deeply cleft mountainous landscape, with its border of snow-clad hills, and out to the horizon of the boundless sea.

The first thing to be done was to make a road from the ruins to the sea-coast.

In such expeditions there is usually no want of personal

discomfort. The climax of it seems to have been reached in this case. Yet such was the enthusiasm of the party that Professor BENNDORF may well say with pride:—

On recalling the first days of our stay, when on every hand we encountered an almost impenetrable vegetation, deeply rent and wildly-tossed-about rocks; when short stages could only be accomplished by hours of climbing and leaping; when close to Tschukur yawned the dizzy abyss of the Dembretschai valley, with its white, glittering sands, on which the solitary trees looked like black specks, and camels and horses were barely recognisable, it seems to me almost hardihood not to have been discouraged by these obstacles. No doubt at first everything went easy and well. To the courteousness of the commandant, who took a personal interest in the practical preparations, we were indebted for such quantities of powder as we required, till later on we obtained dynamite from Castellorizo, where it was used in the fisheries. The temperature was bearable, though some rainy days drenched the beds, but produced only short interruptions of work, and allowing for a few difficult places, the first part of the route did not call for any great exertions. By the end of May, when we were gladdened by a visit from Baron von Warsberg and Professor Zumbusch, who took a friendly interest in all the details of the undertaking, we had been able to construct a tolerably passable road, not merely up to the ruins, but downwards to the eastern side of Tschukur. Soon, however, with the beginning of summer, we experienced a change. The difficulties, which could scarcely have been anticipated, grew greater every day from the great length of the spiral road, leading downwards with its seventeen long turns of mostly rapid descents. With the increasing distance the feeding of the workmen became difficult, the unceasing blasting resounded among the mountains like a thunder-storm, and the scorching heat of the day, little mitigated by the breeze of the valley, clung to its steep sides. To our great regret we were obliged to relinquish the idea of undertaking excavations at Lagina also in the course of the summer, and were glad when, in the end of July, the road was at length completed.

At first the number of labourers employed was from fifty to sixty, but by the end it rose to three times as many. At one time labour was difficult to get owing to the unsettled state of the country produced by the Egyptian crisis. Nor was the party altogether without apprehension of dangers from marauding bands, though happily they escaped all serious inconvenience.

It seems to have been a characteristic of the ancient Lycians to expend artistic and architectural skill on tombs or monuments rather than on temples, contrary to the usage of pure Greek races. The Harpy tomb, now in the British Museum, and the Nereid monument already referred to, are instances of this. To some extent we find the same spirit in the neighbouring province of Caria, where it culminated in the tomb of MAUSOLUS, at Halicarnassus. To this same class of monument appears to have belonged the ruin of Gjölbaschi. It consisted of a square peribolos, enclosing in the centre a great sarcophagus, and having an entrance in the south front not easily accessible. Fortunately the front wall was found standing nearly complete; otherwise it would hardly have been believed that it was enriched with two friezes resting the one immediately above the other, and sculptured with a series of battle scenes, partly legendary, as between Lapiths and Centaurs, or Greeks and Amazons, and partly historical as on the Nereid monument. This arrangement reminds us of the double course of egg-and-tongue moulding on the Nereid monument, and may perhaps assist in the not yet definitely settled arrangement of its various friezes. Round the inner face of the enclosure was another frieze, a considerable part of which has been found, representing ODYSSEUS slaying the suitors of PENELOPE when he returned to Ithaca, the labours of THESEUS and other subjects. The total length of sculptured frieze on the peribolos is reckoned to have been about 100 mètres. Above the doorway are sculptured the projecting foreparts of four bulls, and under them, in low reliefs, some figures which may be meant to indicate the family of the deceased. Among the combats of Lapiths and Centaurs are groups which recall those of the Theseum, the Parthenon metopes, and the Phigaleian frieze to an extent which very decidedly suggests their Attic origin. It has been supposed that the reliefs of the Nereid monument had been sculptured from the designs of an Athenian artist by local workmen in Lycia. But in the present case Professor BENNDORF believes that all the work had been done from first to last either by Attic sculptors or by Lycian Greeks, who had been trained in Athens. The question is at present one of considerable interest in the history of sculpture, especially in the history of bas-relief which, in the latter part of the fifth century B.C.,

seems to have come under the influence of painting, if not generally, at least in certain schools. Of the condition of the friezes Professor BENNDORF says :—

The stone of which the reliefs have been sculptured resembles where it has been recently broken, ordinary white marble, and apart from a few red and yellowish streaks, which might be owing to iron oxidation, preserves a beautiful grey tone and a more or less porous appearance. It is frequently encrusted with lichens, but seems to have suffered chiefly from the sea air. The reliefs most injured by the weather are those of the north wall and of the outside of the south wall, which were exposed to the siroccos from the sea. The reliefs on the west wall are far better preserved, and better still those on the inside of the south wall. Yet on the whole the original surfaces exist only in a few blocks, and that merely when the stone happened to be of a particularly hard texture. The effect of the weather has been felt more or less deeply throughout, and thus the charm of execution, which usually, in fragments of marble sculpture, makes up for the injury in other respects, had, except for a few traces, all but disappeared; yet the vividness of the representation, the outlines, movement, and attributes of the figures, the effect of artistic motives, have suffered remarkably little. With the exception of the Parthenon and the Pergamum altar no other important Greek building has preserved such a long-continuous series of designs, in which the composition of the whole presents a clear idea of its conception and arrangement. It was pleasant to find, even on a cursory glance, that the Greek character of the reliefs was unmistakable. In all details, in the drawing and treatment of the figures where they are well preserved, the charming accuracy and simplicity of the earlier Hellenic style is more and more conspicuous. True to this character, and almost archaic in manner, is the naïveté with which the sculptors appear to have displayed promiscuously all the knowledge and power they possessed.

Unfortunately no clue to the date of these sculptures has been found except such as may be obtained from artistic style; so that we remain in much the same difficulty as we were in before in regard to the Nereid monument. There are no records of Lycian artists, nor of Greeks working in Lycia. This, however, may be said, that the newly-found sculptures, by increasing the perplexity, may hasten a solution of the problem. In any case they are an important addition to the materials for the study of Greek art, while the building itself, from its form and arrangement of the friezes, presents a new source of interest to the students of classical architecture.

CHRIST CHURCH CATHEDRAL, DUBLIN.*

IT is rare to find an architectural subject inspiring so costly and beautiful a volume as the one on Christ Church, Dublin, which is due to the enterprise of Messrs. Sutton Sharpe & Co. There is only one English work with which it can be compared, and that is the description of the Albert Memorial. A volume of this kind is more suggestive of what is produced from time to time by foreign Governments, and there is some satisfaction in finding that the publishers believe there is sufficient interest taken in architecture in this country to warrant its production. Christ Church Cathedral, it will be remembered, was restored by the late Mr. Street, and at the cost of Mr. Henry Roe, a gentleman of whom Dublin may well be proud. The work was of a most interesting character, and it was deemed fitting that a description should be published. It was entrusted to the late Mr. R. J. King, whose competency was shown by his series of guides to the English cathedrals, and his essays on archaeological subjects. On Mr. King's death Mr. Street undertook, after much hesitation, to describe what he had himself designed and carried out. A history of the building has also been compiled by the Rev. Precentor Seymour, and description and history, with several fine illustrations, form the magnificent volume which is now before us.

The Cathedral of Christ Church stands in Dublin, but in its design and in its history it is essentially English, and that this fact has been recognised in Dublin is evident from the greater interest which has always been taken in the rival Cathedral of St. Patrick. The site on which the building stands was given for a church in the eleventh century by the Danish masters of Dublin, and one

better adapted for the purpose was not to be found in the city. It is near the river (and from the fisheries in those days the canons were able to derive a revenue) but it was sufficiently high to be more or less secure. Now the height of the ground may not be apparent, but to anyone who will look at the rere of the neighbouring Roman Catholic Church of St. Audeon, the original condition of the site will be suggested. Nothing is known of the character of the Danish Church of St. Donat: a few fragments have been found which may have formed part of it. When the English arrived in Ireland, the Archbishop of Dublin was St. Laurence O'Toole, and he was one of the ablest of their enemies. Moore says that "if Ireland had had hearts and swords worthy to second him, the invaders would have been easily crushed, and a warning held forth of similar vengeance to all who might follow in the English footsteps." But his character gained him respect, and it is remarkable that Strongbow and some other English leaders undertook the enlargement of his Cathedral. The See was subsequently held by various English ecclesiastics, and the interest taken in Christ Church by the English Court is evident when it is found that King John assigned the Deanery of Penkridge and several villages in England, for the support of the Cathedral. But, on the other hand, the building sustained some calamities. In 1283 the steeple, chapter-house, dormitory, and cloisters were destroyed by fire, and in 1316 the new steeple was destroyed in a storm. In 1562 the vaulting of the nave fell, carrying with it part of the south aisle and arcade. Christ Church was a sort of Royal Chapel, and it is connected with all the representatives of English dominion in Ireland. The alterations, which injured the building, may have been carried out by official tradesmen.

The law courts were held in some buildings connected with the Cathedral, until the end of the eighteenth century. A plan shows that it was surrounded by buildings and narrow alleys. One dark passage was called Hell, and was adorned by a figure having a notoriety that reached Burns, and to which he has given immortality :—

"But this that I am gawn to tell,
Which lately on a night befell,
Is just as true's the devil's in hell
Or Dublin city."

When a chapel was erected for the Viceregal Court in the Castle Yard, Christ Church had no longer the advantage of Government support. The Irish public expected that the expenses of keeping up the fabrics of their churches should in some way be borne by the State, and the repairs of a building of the magnitude of Christ Church would be a burden too great for the laity. The building consequently was neglected, its history was disregarded, and it was not able to compete with the musical attractions of the other cathedral. It ceased to be one of the sights of Dublin, and, although near the seat of Government and convenient of approach, it was rarely visited by strangers. When Thackeray was in Dublin he was made acquainted with everything that was supposed to be noteworthy in the city, but in his book there is not one word about Christ Church Cathedral.

Twenty years ago Christ Church Cathedral was in a deplorable condition, and there seemed to be no prospect of its reparation. Archbishop Whately, who then ruled the See, was never enthusiastic about the appearance of churches, and in his latter days he was only a paralysed wreck. He died in October 1863, and, like so many of his English predecessors, was buried in the Cathedral. Dr. Trench, the new archbishop, could hardly fail to be impressed with the difference between Christ Church and the buildings with which he was familiar in this country, and he at once endeavoured to influence his clergy so that they might imitate the zeal of the English clergy to make church buildings worthy of their uses. The history of the negotiations has yet to be written, but it could not have been long before Mr. Street was consulted—it may have been in an unofficial manner. About two years after Dr. Trench's consecration Mr. Street delivered a lecture in Dublin, which suggests that he had been investigating the building. The people of Dublin were surprised to find an English architect, who was an Associate of the Royal Academy, so enthusiastic about a building to which they, with all their culture, were indifferent. An extract from the lecture, which happens to be little known in England, will indicate what Mr. Street thought of Christ Church in 1866. He said that certain Irish buildings were interesting to him because there could be found in them illustrations of the manner in which art was carried from land to land in the Middle Ages, as

* The Cathedral of the Holy Trinity, commonly called Christ Church Cathedral, Dublin. An Account of the Restoration of the Fabric. By George Edmund Street, R.A. With an Historical Sketch of the Cathedral by Edward Seymour, M.A., Precentor, and a Dedication by Sir Theodore Martin, K.C.B., LL.D. London: Published by Sutton Sharpe & Co. 1882.

they were evidently erected by men who had been engaged on English and Welsh buildings.

Christ Church Cathedral and Kilkenny Cathedral may, he said, be taken as illustrations. These two churches possess certain features so peculiar, and so exactly like what we see in parts of St. David's, Llandaff, and Wells Cathedrals and Glastonbury Abbey, that they must have been executed by the same workmen, or from the designs of the same architect. The windows in the north aisle of Christ Church, the internal shafts of which are intersected by bands at very short intervals, are imitated closely in the north doorway of Kilkenny Cathedral and in a doorway of Santa Florida Abbey in South Wales. The detail of the mouldings of the beautiful columns on the north side of Christ Church, with the singular treatment of the sculptured capitals, has the most curious similarity to the sculptured capitals of the nave arcades at St. David's, and to other capitals at Llandaff and Glastonbury; and in other respects the parallel holds good. These details are all so unlike what is seen in other districts, and so evidently those of one school, that we may fairly state it as a fact which does not require documentary evidence for its support, that these two great Irish churches owe their design to architects whose first works are seen in Glastonbury and who spread thence into Wales, and thence, no doubt, with the English invaders into Ireland. . . . If you can contrive, in the case of Christ Church, to forget modern alterations, to see through whitewash, and to recover from the impression which its squalid look first of all produces, you will be able to realise that the design of the northern side of the nave is one of the most exquisite of its age. The beauty of the sculpture and of the mouldings is extreme and the design of the triforium and clerestory really perfect.

It is evident from this extract that Mr. Street's acquaintance with the Cathedral was more precise than was to be expected in a busy architect who had examined the building in order to extend his knowledge, and it may be assumed that prior to 1866 he studied the building with a view to its restoration. Mr. Seymour says that a resolution was passed commissioning Mr. Street to report upon the Cathedral, but he does not supply the date. At any rate, Mr. Street again investigated the condition of the building in 1868, and he prepared a report to the Dean and Chapter, of which the principal part, and the drawings accompanying it were published in *The Architect* early in 1869. At the time it was not clear how the money that was necessary to carry out a restoration was to be obtained, and therefore Mr. Street's report did not comprise more work than was indispensable. The choir was excluded, and it was suggested, with a view to economy, that it was not necessary to undertake all the work at once. "I should propose," he said, "to take the works in the following order: 1st. To build the south aisle and south side of nave. This would be a complete work in itself, and one which *would be sure to interest every one and draw forth help.* 2nd. To restore the north aisle and north side of the nave. 3rd. To restore the west front and finish the groining of the nave. And lastly, to complete the work by repairing the transepts and repaving the entire church west of the choir." But about the time when the report was prepared circumstances occurred which seemed to dispel all hopes of restoring the building. A Royal Commission came to the conclusion that it would be better if Christ Church ceased to be recognised as a Cathedral, and subsequently the Irish Church Act, by diminishing the revenues as well as the prestige of the Church, made it impossible to enter into arrangements for raising funds by means of a mortgage.

At a time of such depression, when many people lost hope in the Established Church in Ireland, it must have seemed an interposition of Providence when, in March, 1871, Mr. Henry Roe applied to Archbishop Trench for permission to restore the fabric of the Cathedral, and to present it as a thankoffering. The rival Cathedral had been restored by the munificence of another citizen of Dublin. But there was a difference in the procedure of the two benefactors. The ambition of Mr. Guinness was to give as much newness to St. Patrick's as a vast expenditure of money would secure in a building where there was no architect to limit the transformation, and he was not troubled with any anxiety about the loss of old work, or correspondence between the old work and the new. Mr. Roe was more conservative in his proposal. "As I am desirous," he said, "that the restoration should be satisfactorily carried out, and the architectural beauties of the Cathedral scrupulously preserved, I propose to leave the restoration exclusively under the control of George Edmund Street, Esq., in whom the public will repose the fullest confidence that all justice will be done to it." During the long period which the works were on hand, Mr. Roe never deviated in the least from the principle which he thus laid down for himself and others. At the time it could hardly be calculated what a satisfactory restoration was to cost, but throughout Mr. Roe never held back his hand, and from first to last no interference with Mr. Street's proposals was permitted. The tribute which the architect paid to Mr. Roe was well deserved. "If what I have written," says Mr. Street, "proves how great the zeal and munificence of its restorer have been, I shall only have discharged a debt—eminently due from the architect charged with such a work—to a man who never once allowed the costliness of the work to stand in the way of what he wished to be its perfection. When other ways of producing the same effect at less cost might have been adopted, the cost was not thought of, so only that everything ancient might be preserved in such solid and enduring fashion that the Church of

Ireland for ages to come might hear God's praises sung within the many arched vaults of Christ Church." Generosity of this kind is rare in the nineteenth century, and it has been a surprise to many people that the State has not honoured itself by offering some distinction to Mr. Roe. It is to him we owe the preservation of a building which, as being probably the oldest memorial of the English dominion in Ireland, is of national importance, and from its relation to English architecture is of great interest in the history of art.

It was necessary for Mr. Street at the outset to define for himself the limits of restoration. Given a building which has been altered from time to time, where the work introduced was imitative of some past age, instead of representing the time when it was executed, a building which contains remarkable examples of mediæval neglect of honest work, and which in consequence was likely to collapse in the course of a few years, what, under such conditions, ought a restorer to do? Is he to perpetuate shams of construction that are akin to modern jerry-building, and preserve the forlorn aspect of an interior that chills a spectator because it has an historic interest, as it testifies to the sordid indifference of a past age? The Christ Church of 1871 was evidence of a state of things which had continued for generations; was it to be preserved as if it were an old deed which had become torn and partly defaced? Some enthusiasts would answer in the affirmative, on the ground that in such cases it is difficult to know where to stop; and in Dublin opponents of restoration can always point to St. Patrick's Cathedral in support of their arguments, for there one can be certain of the plan alone. Mr. Street, in explaining his theory of restoration, takes high ground. He says that no one but a barbarian would destroy work which possessed that charm of colour which can only be attained by the influence of time, but he has no superstitious regard for a piece of stone because it was wrought by some ancient journeyman. Mr. Street considers that the mediæval workmen were not more honest or more clever than their successors in the nineteenth century, and that it was as requisite to keep them under the control of the architect in one age as in another. The whole of the stonework of the cathedrals of Salisbury and York was finished with a "claw" tool; signs of no other tool being visible, it is, he says, plain that in the thirteenth century there was a controlling authority at a building. At the new Law Courts, as well as at Christ Church, the carving and sculpture was first sketched, and then modelled or altered in the clay by Mr. Street's own hands. It was afterwards executed from casts by the carvers. Is it not safe to conclude that much mediæval work, like the repetitions of foliage in the cornices of the aisles in York Minster, was produced in the same way?

It will follow that what is most important is the idea that was in the architect's mind, and which the workmen endeavoured to express. So long as it is expressed, it matters little in what age the workmen live. The endeavour, therefore, of the restorer should be to discover the intention of the original architect, and, with as much loyalty as circumstances will admit, to realise it. As there is more or less unity about every good design, it is not impossible for a modern architect, having taste and judgment, to supply those parts which may be required to constitute that unity. What we have said may suggest the spirit of Mr. Street's reasoning, although it is not in his words. But it was on this method he worked in Dublin, and to it is owing the consistency which characterises the restored Cathedral. Mr. Street says:—"The founder was as urgent as possible to have everything old preserved with all due reverence. It was to a great extent because the old work was beautiful that he had taken its repair in hand; but to do this, save for the sake of a real, solid, and substantial repair, which would restore the design of the church to its pristine state of beauty, would have been inconsistent indeed. We had a noble building, of which almost everywhere the original architectural design could with certainty be recovered, and the modern alterations, and especially those of 1831, had well-nigh obliterated this design, and substituted nothing that was not mean and contemptible in its stead. Moreover, the more it was examined, the more its hidden story was discovered day by day by the removal of modern concealments, and the more was it found to contain features of singular interest and value to any one who approached the work with true feeling and taste, whilst it had the unusual interest of being in each of its main divisions, choir, transepts, and nave, the complete and unaltered work of one man."

Mr. Street considered that he was fortunate in discovering in the almost complete crypt some clue to the intentions of the unknown designer of the Cathedral. His maxim was that "in all cases where a crypt exists under any portion of an ancient building, it is there that the architect, who wishes really to study the history of its erection, will commence his investigation." The existence of this crypt was well known in Dublin, and strange stories were told of adventures in it (one related to the fate of an officer in full regimentals, who was devoured by the rats), but Mr. Street could claim for himself the credit of being the first person in modern times, who discerned the historic truth contained in the form of the crypt. When plans of the crypt and of the superstructure of the Cathedral were compared, it was discovered that while there was a general coincidence between them, there was (besides an extra bay in the nave) a remarkable difference in the

most important part of the Cathedral. The choir was found to extend about 40 feet east of the wall of the crypt below, thus proving that at a period subsequent to the completion of the church an alteration was made, which affected, if it did not mar the character of the building. The extension was somewhat peculiar in plan. A lady chapel, nearly 70 feet long, had been added at the north-east angle of the building, but the axis of it was not parallel to the axis of the church, being "slewed" towards the north. When the choir was lengthened, the wall of the lady chapel was utilised to save the cost of a new north wall, and, in consequence, there was an awkward bend at the eastern side of the cathedral. The same spirit of economy was evident in the construction of the choir. There was no groining, and the details were worthless when compared with those of the nave. Mr. Street was an advocate of short choirs, which are better adapted to modern ritual. The crooked extension of the choir was therefore removed by him, without scruple, and the altar table now stands in a position that is suggested by the apsidal walls of the crypt. Nothing that has been done is more suggestive of the difference between the old and the new Christ Church than this alteration. Before the restoration the tower seemed to be in the centre of the building; now the eastern part appears to be about one half the length of the western, and what is no less remarkable, the whole of the eastern end is visible instead of being masked by walls and windows, as it was formerly.

The restoration of the remainder of the building is marked by no less decision and aversion to tinkering. In the nave the piers were of an immense size, and apparently should be able to support a lofty tower. But in reality they were shams, and were rent and cracked under the weight of the clerestory and triforium. There was an outer casing of small pieces of wrought stone, and the core was formed of limestone rubble without bond, pieces of timber, and rubbish. Mr. Street says that the wrought stone was imported from Caen, but Professor Hull, the director of the Geological Survey of Ireland, is of opinion that it was an English oolite. In describing the piers Mr. Street accepts their defects with philosophical composure. He believes that unwise constructors and dishonest builders have not been confined to any one period, that at some times good and honest construction was very generally the rule, while at other times it was sadly neglected. The nave piers being of excellent design, Mr. Street reproduced them in his restoration, although they involved an expenditure of material that was unnecessary, if stability was alone considered. How the work was accomplished is thus described:—

On the north side (he says) I built up solid timber centres under the arches, shored up the whole of the wall with a veritable forest of timber, so as to carry its entire weight; and then I had column after column bodily removed, and new columns—constructed in the most solid manner with through stones everywhere, and no filling in of any sort in the centre—inserted throughout the length of the church. The risk and difficulty and consequent anxiety in undertaking such a work were very great, but the happiness of seeing it solidly and successfully completed was ample reward; and the work was done throughout, thanks to the energy and skill of the clerk of works (Mr. Doolin) and the builders (Messrs. Cockburn), without a sign of a crack or settlement. The new columns are of course much stronger than is necessary, but for this there was no help. If the thirteenth-century architect had built with small columns of solid Caen stone, he would have used but little, if any, more of it than he used in his enormous columns of rubble surrounded with a skin of Caen stone.

When Mr. Street resolved to remove the arches that supported the great tower, he substituted another way of carrying the superincumbent weight. Instead of timber shoring he constructed brick discharging arches bit by bit, and with Portland stone springers above the supporting arches. Of course no centering was necessary. When the new arches were complete the old ones were removed, and new carved and moulded arches were formed instead. Mr. Street says that when he adopted this plan at the Bristol Cathedral the contractor repudiated all responsibility for the consequences, but in Dublin there was more faith in his engineering knowledge.

It would be impossible here to describe all Mr. Street's work in the Cathedral, but it must be allowed that he tried to be consistent throughout in adhering to what he believed was the original idea of the designer. He acknowledges that he did not admire the peculiar clerestory windows, which in the central lights have a label that does not correspond with the arch, but he faithfully preserved them. Even the shapeless lump under the capital on one of the groining shafts, which is a mason's freak or a device to conceal an error in placing the central band, has been retained to puzzle posterity. It used to be impossible to see the bases of the piers in the nave, but when the stratum of flooring, which was about 18 inches deep, had been removed, a great part of the old pavement was discovered, and the fragments of the encaustic tiles, which are interesting both from their design and colour, have been preserved. It was resolved that they should be imitated for the new pavement, and Mr. Street bears testimony to the success of Messrs. Craven, Dunnill & Co. in the difficult task of producing tiles to correspond.

In his reverence for the past, and it may be for an ideal that never existed, Mr. Street was not forgetful of the requirements of

the present. Commodious sacristies and a music school have been erected on the site of the lady chapel, a baptistery was added at the north-west end of the nave, and is a reproduction of ancient fragments. By permission of the Corporation, it is allowed to encroach on the very narrow lane behind the Cathedral. Another new erection is the Synod Hall, which stands on the site of St. Michael's Church, a building that was separated by a street. The old tower is retained, and the Hall is connected with the Cathedral by a covered bridge of a single span, which is unique in modern architecture as an example of that kind of construction. The Hall was a supplementary gift from Mr. Roe, and thus Dublin possesses a Cathedral which is as remarkable for the unity and completeness of its parts as for the princely munificence which it represents.

The volume is amply illustrated with steel plates and woodcuts, all of which have been designed by Mr. Brewer, an artist whose work was admired by Mr. Street, although in style it differed from his own. The drawings show much breadth of treatment: both English and French engravers have been employed, but there is surprising uniformity in the manner of treating the cuts. This arises in a great measure from the absence of cross-hatching. There is only one plate which can be considered as ineffective, and that is the view of the building from the bridge over the Liffey at the end of Winetavern Street, but we admit the difficulty of the subject.

There are fine portraits of Mr. Roe and the two Irish archbishops, but one of Mr. Street should have been given. The chromolithographs of windows and tiles are most elaborate. The binding, which was designed by Mr. Street, is exquisite. The ground is fine vellum, on which ornaments made up of shamrocks (and thus suggestive of the country and of the Cathedral) are printed in red. The arms of the archbishop and of the founder, the old seal of the Cathedral, monograms, bands, and titles are worked in gold, forming a whole that delights the eye. In its completeness the volume testifies to skilled direction, and the best praise we can give it is to say that it is a worthy memorial of a memorable work.

PARIS NOTES.

THE committee entrusted with the organisation of the French section of the Amsterdam Exhibition have informed applicants that, owing to an arrangement with the authorities of the Exhibition whereby an increased area is allotted to France, the space demanded by each will be granted without reduction. Every exhibitor will receive within a few days a provisional certificate, on receipt of which he must immediately pay a moiety of the expenses falling to his share. At the last meeting of the committee, presided over by M. Teisserenc de Bort, it was unanimously decided that in consequence of the anxiety displayed by all branches of industry to take part in the Exhibition, and the increased expenses resulting therefrom, the Chambers should be asked for a further credit of 200,000f.

A committee has lately been formed in Paris with a view to organising an International Exhibition of the various apparatus for assuring the safety of railway travellers. The exhibits will be divided into three classes: (1) couplings; (2) signals; (3) breaks. The opening is expected to take place in the month of July.

The Union Centrale des Arts Decoratifs will open its yearly Exhibition in the South-west Galleries of the Palais de l'Industrie on April 15. Artists desirous of exhibiting must inform the President of the Association in writing, on or before March 1, of the number and exact dimensions of the works they propose to send; and the works themselves must be delivered at door No. 7 of the Palace, between March 20 and April 1. The Exhibition will remain open until June 1.

The managing committee of the Society of French Artists have already fixed the dates for the sending in of works seeking admission to the Salon. They are as follows:—1. For oil-paintings, drawings, water-colours, paintings on china and glass, &c., from March 5 to 15 inclusive; vote for the jury, March 17. 2. For sculpture, medallion and jewel engravings, from March 21 to April 10 inclusive; vote for the jury, April 11. 3. For architecture, engraving, and lithography, from April 2 to 5; vote for the jury, April 6.

The Académie des Beaux-Arts on Saturday last nominated the following as assistant jurors in the Grand Prix de Rome competitions of the present year:—Section of Architecture: MM. Guénépin, Guadet, and Pascal. At the same meeting M. Gustave Boulanger read a paper upon the life and work of his predecessor, the late Henri Lehmann, the well-known painter and professor at the Ecole des Beaux-Arts.

In the architectural competition for plans of a firemen's barracks to be erected in the Rue de Chalegny, the jury decided to adopt those of M. Roussi; MM. Mesnard, Soudée, Blondel, and Vié being classed next in order of merit.

In another competition, for a statue of Rude, the sculptor, to be erected at the Ecole des Beaux-Arts, M. Tournois, a former pupil of M. Jouffroy, carried off the prize. Rude is represented standing with a mallet and chisel in his left hand. The design for the pedestal is by M. Guillaume, architect.

M. Gérard, the sculptor who was awarded a medal for his group of *Tobias and the Angel*, exhibited in last year's Salon, has been suddenly struck down by a cerebral affection. The attack came upon him while at work in his studio on a group, *Maternity*, to which he was putting the finishing touches. He was immediately taken to the Sainte-Anne Asylum, but it appears that, unhappily, there is but little hope of his speedy cure.

Within two hours of the cessation of the late fall of snow in Paris seven thousand sweepers were at work upon the task of removing this snow and throwing it into the Seine. The result was that within twenty-four hours scarcely a trace of it was to be seen. During the day notices were posted up all over the city, by order of the Prefect of Police, containing the regulations relative to the removal of the snow from the side-walks, a duty which is incumbent on house proprietors, occupiers of shops, &c.

The Commission appointed by M. Antonin Proust during his short period of office as Minister of Fine Arts, to investigate and report upon the situation and prospects of French art, industries, and workmen, last week held its first meeting during the present year. After electing as secretary M. Jules Comte, Inspector-General of Decorative Art Schools, the Commission examined M. Gastine-Renette, gunsmith, M. Racinet, manager of Messrs. Didot's chromo-lithographic department, M. Valadon, a partner of Messrs. Goupil, and MM. Krieger and Beurdeley for the furniture trade. Next week representatives of the Trades' Unions will be heard. M. Antonin Proust, now a member of the Commission, has been appointed reporter, and the categories, headings, &c., which he has adopted for his work have met with the unanimous approval of his colleagues.

Notwithstanding the protests of the Society of French Artists, the Government have hitherto given no indication of any change in their determination to organise during the present year, under the title of "L'Exposition Nationale," the first of a series of triennial exhibitions of the works of living artists. It is even announced officially that this Exhibition will be inaugurated on September 15, and remain open until the end of October. Works executed within the last five years, *i.e.* since May 1, 1878, will alone be admitted, and artists are requested to send in at once to the offices in the Palais de l'Industrie a descriptive notice of the works they purpose sending, with particulars of the exhibitions in which they have previously appeared. All paintings and sculptures shown at the Amsterdam Exhibition will, however, be excluded. Between February 1 and March 5 these notices will be examined and replies sent out on April 1. From July 10 to 30 works sent in without any preliminary notice will be inspected by the Jury of Admission, while those accepted provisionally after notice will be verified between August 1 and 16.

French governing bodies, and especially the authorities of the City of Paris, continue to advance, not only resolutely but rapidly, in the direction of making education, even in its higher and technical branches, absolutely free of cost and open to all. At a late meeting of the Municipal Council it was decided to establish in the Rue Sainte-Elisabeth a school of practical and preparatory drawing, and in the Rue des Petits-Hôtels an industrial art school, both of which will be organised in accordance with the conditions and programme laid down by the committee appointed to superintend the teaching of drawing. The staff will comprise professors and assistant-professors of architectural drawing, sculpture, engraving, applied mathematics, freehand, and geometrical drawing. To pupils distinguishing themselves in the schools the Council further offer three annual money prizes of 300, 250, and 200 francs respectively.

The Marquis of Bute on Tuesday laid the memorial stone of the new infirmary at Cardiff, a building which will cost 28,000*l.* The site, which is estimated to be worth 10,000*l.*, was given by Lord Bute, who has also subscribed several thousand pounds to the building fund.

MR. FORSTER ON ART EDUCATION.

ON Saturday evening Mr. W. E. Forster, M.P., presided at the first annual meeting of the Ilkley School of Art, when he distributed the prizes to the students. In his address he said:—

Mr. Ruskin, than whom there is no man who has done more—I may say who has done so much—to further the study of art in this country, makes in one of his books a statement to which I must demur, that everybody can be taught to draw. Well, it may be a rule, but certainly I am an exception. I tried at school, but I, and most certainly my master, had to give up the hope of my being taught. So as regards that I come as a warning, but I am very glad to come to you as a neighbour to congratulate you. I am afraid that in parts of Germany and in Switzerland, and probably in France, they are taking very much of our trade by their better art education. That is a very serious matter indeed, and one which it does not become English people to put up with. We are becoming alive to it in the large towns. As you know, Bradford is setting to work in forming a large technical school. But I am very much inclined to think that it will require a national effort to really compete with those countries. But we must not look at the subject merely and solely from the point of view of its commercial advantages. The study of the art of drawing and painting is a very great enjoyment in itself, and the study of it, even if it does not enable the student to produce a good work of art himself or herself, gives what I may call a fresh sense in enjoying the beauties of nature. I think if we entirely forget that side of the subject we shall not unlikely be punished by finding it exceedingly difficult to obtain the commercial advantages. After all, there will be the best schools of design and the best students in those schools when they have the greatest pleasure in designing and in drawing; and, in fact, we may say that art is a maiden that cannot be wooed merely by gold; that if we are simply trying to encourage our study of painting or drawing by the commercial advantages, the prices that can be obtained from manufactures or by successful artistic work, the probability is that we shall not be pre-eminent in that work. If we look back to past ages we shall find that in those countries in which art prevailed, and the works of which are still admired by us, it must have been quite clear that, while there were some men of very great genius, there must also have been a community that understood the principles of art, and that enjoyed all the details of artistic work. I really am deficient in this matter. The deficiency I have felt is that for want of an early education I do not so much enjoy works of art as I should do, but it is impossible for any one that keeps his eyes open not to see, taking the great monuments, the ruined monuments of Greece, or taking our great cathedrals or many of our great buildings, that every stone almost is placed artistically, that every line of drawing is beautiful, and we cannot but feel that all that could not have been done by the one master; that he must have had a collection of persons about him who had the clearest possible appreciation of beauty, and whose tastes were developed in the highest possible manner. That used to be the case in our own country. Of course there was a limited number, but who can go to our great cathedrals without feeling that every man employed about it must have been an artist, because you find no mistakes, nothing that shocks you, nothing that is discordant in one part of it with the other; and the same thing applies to the great buildings of the Renaissance. I do not know whether any of you have taken a tour down the valley of the Loire, near Tours. I don't know whether experts about us or good judges or connoisseurs in art would consider the Castle of Chambord a very great specimen of architecture. It struck me as being exceedingly beautiful. But the one great beauty in that magnificent palace, which was built by Francis I., is the harmony, the melody I may say, throughout the whole. If you look at it from a distance it appears perfectly symmetrical, and if you go close to it you find that no one side is the exact image of the other side, but they are so built the one into the other; they so blend one into the other that it looks a work of perfect symmetry. They were all artists; the workmen as well as the leading genius must have been all of them real artists. No one was more convinced of this fact than the man who first began our schools of design—that painter of genius, Mr. Haydon. I think we sometimes forget what is owing to Mr. Haydon. More than fifty years ago, very much with the help of Mr. Cobden and one or two gentlemen in Manchester, and after very hard, uphill work, great difficulty in getting any person anywhere to assist him, and with the enthusiasm which belonged to his character and which makes him one of the most striking men of our recent history, independently of art, he at last formed a school of design, and he held it out before the manufacturers as a necessity to them. He states in very powerful language, "Now that the great war has come to an end you will have great competitors on the Continent; you must be ready to meet them in the superiority of design." Notwithstanding the schools that he started, there has been great apathy in that matter, and we now find that we have to meet them, and as a matter of fact we find that we may have to overtake them. But although he held forward the commercial advantages, he in the strongest possible language said that they could only be met by raising the standard of taste throughout the country—that you

must not merely in your art schools be contented with sending young men to take advantage of the higher principles, the greater and more detailed and practical teaching which we shall have at the Technical School at Bradford, but even as commercial artists, as manufacturing artists, you must try to implant in them a real love of art for its own sake. When we venture to talk about art in England, we are sometimes met with some such statement as this, "Oh, England is an industrious country. You work hard—at least you used to do—and you have men of great energy about you. You are not easily beaten. But yours is a dull, foggy country, and you are a slow sort of people. How can you expect in art to contend with the keen, sharp, bright, brilliant intellects of the South and of the glorious southern sky." Well, just let me read you a word or two from Mr. Haydon about that, because he knew what he was talking about: "Why should we not place ourselves on a level with the repute of foreign nations in other departments"—science and so forth. "Is there any just reason? Oh, yes," he says, "the climate is foggy; the people are commercial, and have no taste; you are worried with political squabbles. It will never do. I answer"—and he makes a bold statement, which I have no doubt he could justify—"I answer," he says, "that the climate of England is more fitted for great effort than any other in the world. Were not the Medici, the great merchant princes of Florence, commercial, and who more enlightened? And, pray, were there no political squabbles in Italy and Greece? Why, art advanced in both countries surrounded by nothing else," with the addition of poisoning and stabbing among friends, which must have been an agreeable variety in a country where coroners' inquests were never heard of. Now, just let us take those few words of Mr. Haydon's. It is very true that political contests do not injure art. If the mind is stored upon one great matter it is more sensitive to excitement upon other questions, and you will find certainly with poetry, and with philosophy, and I believe also with art, that in the history of every nation the ages in which men have made themselves famous in all those literary or artistic departments, have been those in which there have been the struggles for freedom or patriotic efforts on behalf of the country. Then he speaks about the climate. That sounds a very bold statement, but I have no doubt it is true. Here my experience is good for nothing, but I cannot help feeling, unable as I am to appreciate it, what a beauty—a special beauty—there is in our climate. Only one more remark upon this text that Mr. Haydon has given me. He says that notwithstanding the state of morals in Italy art flourished; but, as the moral state of Italy got worse, so art lost its power and glory. I believe that that is a historical fact, and that those poisonings and all the vices which make the history of the Middle Ages in Italy full of some of the most fearful pictures of all history were too powerful as degrading influences for art to flourish, and art in Italy has never recovered from them. And that makes me feel that we must not only, as Mr. Ruskin says, cultivate the eye to see, but we must have the soul to admire; we must not be merely charmed with pictures that are exact likenesses, but we ought to aspire to such art as would give us that which is beautiful. It is very interesting to see a picture that is exactly true to life, but I don't know that such a picture is any very great advantage either to the country or to the person who possesses it. Now in France there is a school of pictures—I forget the name of it—in which there is the most wonderful realistic truth. What is painted is exactly like. But it does not appear to me that it is any advantage to see it. I remember at an exhibition in Paris seeing a small picture for which, I was told, several hundred pounds had been given, and it was of a young woman—not a particularly good-looking young woman—in morning fashionable dress. She was walking by the side of a wall—a wall on one side and a garden on the other. There was no ideal of beauty at all about it, but if you had looked into it with a magnifying glass of the highest possible power you would have found the exact truth of everything in it. But, depend upon it, that art which contents itself with that will not last. Perhaps the greatest example of this is the Dutch school of painting. I have an artist by me, and I dare say he will catch me up, because when a man talks about things without having had any real teaching about them, and simply speaks from his impressions, he is very likely to get wrong. But take the Dutch school. We know how striking the Dutch pictures are, but we don't hear much of the Dutch school now; and I cannot help thinking that if the wonderful talent which was shown by those Dutch painters, and which gave such truthful pictures of a public-house scene or of a village romping dance, had been given to higher subjects, we should have had that school continuing in force and power much longer. But I would even go further than that. I very much doubt whether you will ever have very high efforts of art in a country, at any rate long continued, unless you have that country possessed by high and noble aspirations, and unless it is in a country in which men are not content with seeing portrayed the mere material objects that they see, but know that they are after all the outward semblance of real truths, and that there is something behind them. We have no right to triumph over other countries, we have great cause to find fault with ourselves, and one of our few compensating virtues is that there are no people so inclined to find fault with Englishmen as are Englishmen themselves; but when I have the French school put before me and am

told of the enormous sums that are spent in drawing in the elementary schools of France as compared with what is spent in that way in England, I only hope that that will not result, if we follow their example, in our having a French school of painting. If you go to the exhibition in France you will not find it "a modest temple," which is what Mr. Moeller so well tells us in his report that we should aim at for Ilkley. I won't allude to that except to say that there certainly does appear a too great characteristic in the French school of painting. There are a great many beautiful landscapes, but the great characteristic is an appeal to fashion, and what strikes me as even a worse sign—a delight in dwelling upon cruelty, upon suffering, upon miserable martyrdoms, and not merely miserable martyrdoms, but miserable murders and upon men in the horrible contortions of violent death. I cannot help feeling that that is a sort of Nemesis upon the forgetfulness of any aspirations beyond those which are given for material objects.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT last week's meeting of the Edinburgh Architectural Association (the President, Mr. David M'Gibbon, in the chair) Mr. Thomas P. Marwick, architect, read a paper on "The Valuation of Heritable and Landed Estate." The author argued that no one was better qualified to ascertain the cost of a building, the suitability of a site, and the probability of good or bad returns from building on it, the probable length of life of a building, its state of repair, and the expense of putting it in tenantable condition, or its desirability for renting, residential, or investment purposes, than a properly-educated architect. In treating of the value of land, twenty-eight to thirty-three years' purchase of the free rental was stated as the usual price. Each individual case must, however, stand on its own merits. No hard-and-fast rules for the ascertainment of value are possible, but certain necessary qualifications, certain methods used, and certain data on which to proceed were recapitulated. To find the value of land on which buildings exist, deduct from the gross rent received from the various lettings the percentage on the capital expended, with outgoings in the shape of repairs, feu, insurance, empties, rates, and management, and the balance represents the annual lettable value of the ground, from which the rate per yard is easily deduced. In the valuation of property the usual methods of arriving at results were detailed. In fixing the rents, which is usually a first consideration, it is necessary to ascertain if those existing are fair, how long they have remained stationary, or, if raised recently with a view to sale, what reasonable prospects there are of increase or decrease, what similar property in the neighbourhood brings, what facilities the subjects have to cope with new property in the district, if any, or what probabilities there are of new buildings in the locality that may ultimately lead to depreciation in the return. In regard to "prospective enhancement" of value and "depreciation," notice was taken of the different causes which led to such results; as *e.g.* the transmigration of sections of the population to particular districts, railways, or such like. Some remarkable illustrative instances were given. In lending on subjects liable to violent depreciation, such as manufactories, deferred building land or buildings erected for specific purposes—where the financial position and social status of the borrower is kept out of view—great care requires to be exercised; and in all cases a substantial margin should be reserved for fluctuations and contingencies, the failure to attend to this being the cause of much loss during the recent inflated condition of the property market. It was noticed that nearly half a million pounds worth of shop and house property was exposed for sale by public auction within a few weeks at the beginning of 1882 in Edinburgh, but only a small portion found purchasers, while probably double that quantity was for sale privately. The rental of vacant property in the city this year was above 82,000*l.*, with subjects of all kinds practically unsaleable except at low prices. In problematical valuations from plans it was pointed out that the rents of new buildings—especially in suburban districts—may be for a considerable period after erection very low, and this low rental must be the basis of valuation for a loan at that stage, as the subjects may have to be realised by the bondholder under very disadvantageous circumstances on completion. If loans are plentiful, speculative property is erected, irrespective of any demand, and moderate advances in these cases tend to keep this speculation within proper limits, while encouraging only legitimate trading by men with at least some moderate amount of capital. The various elements requiring consideration, and the methods of arriving at the value of feu-duties and casualties, country houses, town residences, freehold and leasehold; villas, tenements, property used for trade purposes, city business premises, licensed premises, ripe, deferred, *remise* building, and agricultural land were next treated of; while the cause of differences in valuers' opinions, and the principles to observe in valuing for compensation claims, severance damage, trade disturbance, and goodwill were minutely detailed. Mr. Marwick then considered the question of fancy prices, and the methods used in rating different kinds of property for assessment purposes. In the rating of hereditaments, Lord Denman was quoted as saying:—"The outlay of capital might furnish no criterion of the rent a property should yield,

since such capital may have been injudiciously expended, and what was costly may have become worthless by subsequent changes." In all business connected with the purchase, sale, or mortgaging of property, it was as essential to consult a competent professional man as in cases of serious illness it was to consult a skilled medical adviser. It was also pointed out that a valuator could not be blamed for loss arising through unforeseen occurrences. The valuer gave the current market or saleable value, and he could not be supposed to look forward to great periods of inflation or depression. He performed his duty by simply calling attention to the possible change, leaving further action to the purchaser or mortgagee. In concluding, the low scale of fees in comparison with those charged in England and Ireland was alluded to, the responsibility attached to a valuator's position, and the necessity for the most unimpeachable integrity in all transactions, combined with skill, discernment, and experience. A vote of thanks was awarded to Mr. Marwick for his excellent and useful paper.

SOCIETY FOR ENCOURAGEMENT OF FINE ARTS.

THE opening lecture of this Society was given on January 26, at the Society's Rooms, 9 Conduit Street, by Mr. Robert W. Edis, F.S.A., on "Art in the House," the chair being taken by Mr. J. Forbes Robertson. The lecturer endeavoured throughout to treat his subject from a popular point of view, insisting that the artistic treatment and arrangement of colouring of wall surfaces, carpets, and hangings, and good form and design in the general fittings and furniture of the house, need not of necessity be more costly than badly-designed papers and tissues and ill-arranged furniture, and that the commonest articles of daily use might just as well be pretty in form and simple in colouring as ugly and commonplace. At the same time he protested strongly against all crazes and fashions which delighted in washed-out colours in curtains, carpets, and wall coverings, and curious eccentricity of design in furniture, and expressed his opinion that it was equally desirable, as a matter of health and common sense, that the decoration and colouring of our rooms should be harmonious and pleasant, and that the furniture should be sound in construction, comfortable in shape, and fitted for its special purpose, as to insist upon good drainage and ventilation. Mr. Edis pointed out the evil effects of the modern system of covering the whole surface of floors with carpets, under which dirt and dust accumulated, to the detriment of health and cleanliness; the bad mental effect of jarring colours and patterns; and the nervous irritability almost unknowingly excited by incongruous and staring patterns and uncomfortable and badly-constructed furniture. Mr. Edis condemned as trashy, commonplace, and costly the sham constructive plaster-work of the ceilings, &c., of the modern houses of our London suburbs, which, he contended, was only intended to deceive the unwary house-hunter, and to give an appearance of finish to generally inferior work and material; while it, at the same time, by offering resting-places for dirt and dust, helped to make the rooms stuffy and unhealthy. In speaking of the decorative treatment of different rooms, he touched briefly on the experiments that had been made of the effects of various colours upon the optic nerve and upon the brain, contending that in the selection of wall coverings or hangings no strongly marked patterns should be accepted—such as birds seemingly in flight, or cherubs holding festoons, frozen into rest, or bunches of flowers fossilised, so to say, into unnatural forms, so as to present longways and crossways, or any way they were looked at, clearly marked lines or spots on the general surface, at all times fatiguing to the eye, and tending to the discomfort and mental annoyance of those who might be suffering from sickness or brain-weariness. Mr. Edis urged the importance of good figure decoration in modern rooms, and thought that no real artistic character could be obtained by mere block-printed papers or painted surfaces; that the painter and sculptor should be brought into more intimate connection with house decoration; and that while it was desirable to keep the general decoration of the rooms simple and quiet, to avoid all picking out, as it is called, of moulding and elaborate stencil work, which at best is but machinery work of the hands, a broad general effect should be sought in the general surfaces, with some portion of the walls, either in frieze or panel, treated in good decorative subjects of figures, birds, or natural flowers, like the houses of Pompeii, and many of the old churches and houses of the Middle Ages—subjects treated as flat decoration, and not elaborately modelled as easel pictures. The lecturer entered briefly into the question of sanitation in the fitting up of the various rooms, pointing out the disadvantages of much of the ordinary furniture, which often was not only exceedingly ill-fitted for its purpose, but, by its general form and shape, tended to hold dirt and dust, and thus, while both unartistic and unsuitable, became absolutely unhealthy. He contrasted the ordinary fittings of a house bought in haste with those specially designed to suit the requirements of the individual householder; pointing out that the want of the same common sense, which pertained in other matters of business, in the

furnishing of houses often resulted in filling them with fittings which might look well enough in a show-room, but which often turn out, like ready-made clothing, exceedingly bad fitting and ill-adapted for the individual wearers. He contended that all furniture should be comfortable and common sense in form, fitted for its particular purpose, and that rooms should be made livable as well as artistic; that the wall-hangings and carpets should be bright and cheerful in colouring, arranged harmoniously, with good figure or other artistic work incorporated in the design, and not eccentric or so-called "æsthetic," with washed-out and ugly colouring and ill-drawn and utterly inartistic ornament; and that fitness for the purposes for which the various articles of furniture are intended, and common sense treatment of their form and shape, should be manifest in the design and make of all the innumerable objects of daily use. In speaking especially of the craze for Oriental work of all kinds, Mr. Edis drew attention to the damage that was being done to native art and industry, both in India and China, by the wretched system of sending out modern English and European examples to be copied, and to the bad influence of schools of art and gaoi manufactures, in consequence of which much of the once excellent productions of India, China, and Japan were now only Oriental in price, while being Brummagem and cockneyfied in design and colouring. He objected to the slavish imitation of examples of ancient art, which, he said, are made to do duty in modern so-called artistic decoration, urging that the art work which was appropriate in the houses of Pompeii or adapted to the walls of a Greek temple or Chinese pagoda has nothing in common with English home life. In conclusion, Mr. Edis insisted that true art in the house meant the practical rendering in good taste and pleasant guise of all the absolute necessities and requirements of modern life, and that all domestic art was bad which ignored the purposes to which the furniture, decoration, or general belongings of a house were to be put; that the art of our houses should speak the language of our own day, and not be a reproduction or imitation of the art, no matter how beautiful, of other days in which the conditions of life were totally different.

STIRLING FINE ART EXHIBITION.

THE Art Exhibition in the Smith Institute, Stirling, was formally opened on Monday. Provost Yellowlees presided. Professor Baldwin Brown delivered the opening address. He said it was in the cabinet picture of the expressive or poetic kind rather than in the decorative composition that the artistic feeling of our countrymen showed itself to best advantage; and it was this form of art which might be encouraged immensely by exhibitions like the present. To produce an artistic representation Nature must not only be laboriously followed step by step in all her details, but must be understood and grasped in the mass, and then rendered with breadth and artistic intention. To learn how to do this was to learn the secret of art, and it was a secret which the student would gather only from his observation and copying of natural forms. First-rate works of art were as essential as objects of study to the painter who was to excel as was Nature herself, and it was chiefly through their agency that he would come to understand the meaning of "treatment," of "breadth," and "style," which were as necessary to good art as careful technique and the study of models. There was nothing of which the rising painters of the British school needed to be more frequently reminded than of the necessity for the exercise of a certain amount of imaginative and creative power in all their work. There was a breadth of style and an air of mastery about studies done in the best Continental schools which contrasted with a certain crudeness about much of our native work. Here there was plenty of nature, plenty of force and colour, but too often a want of that harmony which was obtained by a proper subordination of details to the general effect, and which was a matter not of nature but of art. Here, as elsewhere in art, what was wanted was, of course, the happy mean. We were often struck by the harmonious effect and artistic charm of some study of a familiar old street or building which had in nature never won from us more than a passing glance. Some of George Manson's "bits" of Old Edinburgh might be taken as examples. What had the artist done with the scene to elevate it thus into the region of art and beauty. If we examined the work a little, we should probably find that it was a question very much of tone. Subtle gradations from light to dark over the objects brought them all into harmony. The distance was made to fade away into mist; an extra depth was thrown into a shadow, and a little air of mystery stole at once over the scene. A figure or two, more hinted at than seen, gave a pathetic touch, and the transformation was complete—a commonplace object had given birth to a true piece of art. These remarks, the professor said in conclusion, had been offered in the hope that they might lead some to consider that for excellence in art something more was wanted than mere hand-copying. A little more feeling and imagination in the treatment of a scene, a deeper insight into nature, and a more subtle sense of harmony of tones, and the ordinary school study might become a precious work of art.

NOTES AND COMMENTS.

THE Society of Arts offer the following premiums:—A gold medal, or 20*l.*, for the best design, from a poem, or from history, or from the Scriptures, prepared with a view to Mural decoration. A gold medal to that student in a school of art in the United Kingdom, who exhibits the best drawing from the nude figure, executed in black and red chalk, in the manner so successfully practised by Mulready. Gold medals will also be awarded (1) for the best plan for obviating or diminishing risk to life in coal-mining; (2) for the best plan for obviating or diminishing risk to life in the manufacture, storage, and transport of explosives; and (3) for the best invention having for its object the prevention and extinction of fires in theatres and places of public amusement. A prize of 100*l.* will also be given for the best essay on the utilisation of electricity for motive power. The designs, essays, &c., are to be sent in on or before October 31, 1883.

ANOTHER important step in the direction of the encouragement of technical studies is secured in the establishment of a Technical College at Finsbury. The building is situated in Tabernacle Row, and has been built from the designs of Mr. E. N. CLIFTON, the architect of the Cowper Street Schools, in the rear of the college, which have served temporarily for the needs of the students. The school provides for evening as well as day classes, and in its plan it represents the experience of similar institutions. Persons of either sex may there receive a scientific and practical preparatory training for intermediate posts in industrial works.

THE more closely Peterborough Cathedral is scrutinised, the more evident it is that the restoration will have to be on a larger scale than was originally contemplated. Mr. PEARSON has felt compelled to pronounce the whole of the central tower in so shattered and unsafe a state that it is advisable to take down the failing walls to below the tops of the lantern arches, together with the crushed piers. He states that it will not be absolutely impossible to shore up the superstructure while rebuilding the two eastern piers, the settlement of which has caused the mischief; but that this course would involve an additional cost of at least 4,000*l.*, and leave the tower eventually in a crazy state. The Chapter and the Restoration Committee have come to the decision that the tower must be taken down without delay to the point indicated by Mr. PEARSON, together with the two piers, and rebuilt, as far as possible, stone for stone. Mr. PEARSON's estimate for this taking down and rebuilding is 13,000*l.* This does not include any additional height being given to the tower, which is desired by many, or the restoration of the choir in its original dimensions, or the repairs of the transept walls and west front. How much the whole will cost it is of course impossible to estimate, and the amount may reach 50,000*l.* At present the committee do not possess one-twelfth that sum.

THE Town Council of Walsall, with the authorities of seven other boroughs, lately retained Professor FLEMING JENKIN, of Edinburgh, to advise them in making arrangements with Electric Lighting Companies. At his suggestion the following clauses are proposed to be inserted in all provisional orders, viz.:—(1) Requiring the company to satisfy the Board of Trade, before commencing operations, that it has a sufficient amount of capital, and in the case of one company which sought to supply several towns, to allot to Walsall a certain amount of capital for the carrying out of the works; (2) that two companies shall not work on the same area; (3) that the Council may have a voice in the selection of a site for the erection of the machine-house; (4) that overhead lines shall be prohibited; (5) that all purchasers shall be put upon the same footing as regards price, and that the price for public lights shall be as low as to any other consumer; (6) that adequate powers shall be taken as to commencement and continuation of supply, and especially to prevent the companies suspending the supply two hours each night; (7) that in the case of the profits of the companies being increased by new inventions, or other causes, the public should get the advantage as in the case of gas companies; (8) that the roads should be broken up only under the direction of the Council; (9) that the companies should deposit or guarantee a sufficient

sum for the completion of the work, and that the Corporation should have power to purchase at the end of fourteen years. It has yet to be made known to what extent the companies are willing to accept the conditions.

THE remains of the Roman buildings which have been discovered at Sanxay, near Poitiers, have been lately visited by an English clergyman, who was impressed with what he saw. The façade of the temple measures 250 feet, and is approached by three flights of steps. It is quite easy to make out the entire plan of the building, which, strange to say, was cruciform! There are also remains of baths, in which the arrangements can be traced. The theatre was on the slope of a hill, the seats being formed out of the rock. The arena is in good condition, and was circular. The seats range only above half the enclosure, but the arena seems to have been adapted to feats of horsemanship as well as scenic performances. The masonry is of excellent quality, and the stones all worked to one size. The seats will accommodate 7,000 or 8,000 persons, so that the city must have had a large population. The remains were discovered by the Père DE LA CROIX, and he has not only defrayed all the cost of uncovering, but has himself drawn and planned all the remains discovered. He proposes to erect a museum on the spot if the French Government will undertake to complete the excavations.

THE inquiry at Bradford concerning the fall of the chimney of the Newland Mills was concluded on Wednesday. After a consultation of two hours the following verdict was returned by the coroner's jury:—"We find that the owners of the property at Newland Mills did all that impractical men could reasonably be expected to do under the circumstances; therefore we do not attach any blame to them, or find them guilty of negligence; and we give our verdict—'Accidental death.' We are of opinion that the foundation was good and the fall of the chimney was partly due to cutting, aided by the strong wind on the morning of the accident, and regret the works were not stopped during the repairs." No other verdict, we suppose, was possible. In manufacturing towns there is much faith in the genius of chimney straighteners, and the jury were likely to possess that faith. It was plain from the evidence that the late owner of the mill did not consider himself to be an impractical man; on the contrary, he was esteemed by the people in his service as an authority on construction. He overruled the opinions of builders and architects, and the consequences of his despotic interference are now apparent. It was with difficulty that his representatives could be persuaded that there was any risk attending a work which he directed. The catastrophe is a terrible example of the danger which may arise when a man is his own architect.

THE Manchester Corporation have shown by their purchase of the late CECIL LAWSON's *Minister's Garden* that they are possessed of good taste as well as liberality. But we trust that they will in future recognise the work of living painters. Fame is desirable, but there are few artists who would prefer it to substantial realities. CECIL LAWSON had much difficulty in making his genius known, and it suggests the value of public applause when it is found that his great work was without a purchaser. The *Minister's Garden* is a testimony of homage to GOLDSMITH, and it is one of which any poet might be proud. It is not a representation of "Sweet Auburn," but a country parson in the last century, although he had but forty pounds a year, might be the possessor of such a tangled but delightful garden as is shown in the foreground of the picture.

THE opposition to the accepted plans for the Eastbourne Town Hall has not ceased. A statement has been handed to the representative of the Local Board which contains the grounds on which it is maintained the plans should be set aside. They are as follows:—(1) That the plans are not the same upon which the money was borrowed when the inspector held the inquiry, but were very materially altered; (2) the plans as now altered are defective, insufficient, and unworkable; (3) that for the Board to instruct the Surveyor to get out the plans was *ultra vires*, as it is no part of the Surveyor's duties to do the same, as defined by "The Eastbourne Town Improvement Act."

ILLUSTRATIONS.

ILLUSTRATIONS OF CHRIST CHURCH CATHEDRAL, DUBLIN.

WE are able to publish in the present number three of the plates from the splendid folio on Christ Church Cathedral, which has been published by Messrs. SUTTON SHARPE & Co., and they have been selected as examples of Mr. STREET's own work.

THE WEST FRONT.

The first is an etching of the west end of the building. If a comparison is made between this view and one which is found in the first volume of *The Architect*, it will be seen how much more justice Mr. STREET was able to do to himself when he was not hampered by the fear of expenditure. The following is Mr. STREET's description of the part of the Cathedral shown in the illustration :—

The west end was entirely modernised. It had a poor modern doorway, and a still meaner window. There was nothing to respect, and nothing that the most zealous stickler for the conservation of old work could have desired to remain unaltered. It was clear to me, however, that a cathedral church such as this must have an important doorway, and being free to do as I liked, I designed a large double doorway, with jambs of rich character, moulded and shafted, and with internal jambs and an arch, founded on the other inside arches of the windows and doors in the aisles. It may be imagined that my pleasure was great when I heard from Dublin, after the design had been made, that a large jamb-stone had been discovered in the wall which exactly agreed with my full-size section. It was discovered in time to be used, and is now built into the new doorway, of which it forms one of the jamb-stones. Above the doorway thus happily restored we found, in the north-west angle of the nave, the whole of the jamb of the original west window. This had been built up, and on cutting into the wall it was pleasant indeed to find enough remaining to give all the levels and details of this important feature; and there can be no doubt that just as in the choir we are able to give indisputable evidence that the arches of the apse are exact restorations of the old work, so here we can assert, with equal confidence, that the interior of the west end is equally an all but exact revival of the old design.

THE CHOIR SCREEN.

It has been asserted that in many of the ancient Irish churches the chancel was separated from the nave by a thick wall, with openings. But in the modern Established Church all divisions of the kind were regarded with less favour in Ireland than in England. It was a bold experiment to attempt the introduction of a choir screen in the restored Cathedral of Christ Church, and it must be recorded that the innovation gave rise to much bitterness. Mr. STREET was assured of the legality of all the details, and the screen is one of the finest modern works of its class. In explaining the reasons for its adoption, Mr. STREET says :—

As now arranged, the choir is divided from the nave by an open screen, constructed of stone, alabaster, and marbles. Screens of some sort were among the earliest furniture of ancient churches. The very name of the eastern part of the church is derived from the *cancelli*, which separated it from the nave. The most venerable churches in Christendom, such as those of San Clemente in Rome, and of Porcello, near Venice, still retain their ancient screens; these were walls of marble enriched with carving or mouldings. Within them are the seats for the minister and choir. In our English churches and cathedrals the same arrangements have been preserved almost without exception, and in the one great cathedral built since the Reformation—St. Paul's—the screen, as was usual in all churches of the sixteenth and seventeenth centuries, was a prominent and handsome feature in the choir arrangements before the modern alterations of the interior. My desire in designing a screen for Christ Church was to make one which should not only be in itself a beautiful object, but which should not shut out the choir from view, nor impede the sound of the voices of the choristers. Upon the first point it does not become me to express an opinion, but I heartily did my best. Then I determined to construct the work in stone, marble, and alabaster, because with these materials it is possible to make the openings wider; and consequently, paradoxical as it may seem, the appearance of obstruction is less than it is in the case of a really lighter wooden screen. The view of the screen will show that it is not really an obstruction, and in execution it hardly appears to be so much so as in the drawing. On the third point I was satisfied, before I advised the erection of the screen, that the acoustic properties of the church would gain rather than lose by this erection. . . . The screen is an open arcade of five carved arches, with a carved and perforated cornice, and much delicate carving on the upper part. This is mainly executed in yellow Mansfield stone, the columns, plinth, and capitals being of marble, and the diapered panels of the lower part in English alabaster. Over the entrance doorway is a

carving of an *Agnus Dei*, and the whole is finished by a cross, designed from the pattern of the exquisite cross of Cong, one of the greatest treasures of antiquity of which Dublin can boast. The gates are of brass, and of elaborate design, and serve to complete what is the most sumptuous portion of the furniture of the church, and one which, more than any other, serves to increase the apparent scale of the building, by giving it somewhat of that mystery of things half seen which is so great an element in architectural effect.

THE SYNOD HALL.

A design for a Synod Hall was prepared by Mr. STREET at the suggestion of the late venerable Duke of LEINSTER; but the work was carried out, like the Cathedral, at Mr. ROE's expense. The following is the architect's description :—

The Synod Hall is a chamber measuring 73 feet by 32 feet, with an open roof, panelled throughout, and lighted by windows at the two ends and by dormers in the roof. It is surrounded by corridors and division lobbies, and from one of these a door leads to the bridge and thence down by a flight of steps to the south-west porch of the nave. In the wall of the Synod Hall is inserted a brass plate bearing a coat of arms, and the motto, "*Virtute et labore*," with the following inscription :—"This Synod Hall, erected at the sole expense of Henry Roe, a citizen of Dublin, was by him presented, on the 6th day of April, 1875, to the Church of Ireland in General Synod assembled, by whose order this tablet is here placed."

DESIGN FOR THE DECORATION OF THE CUPOLA OF ST. PAUL'S CATHEDRAL, LONDON.

THE original drawing, from which this plate is taken, represents one-eighth part of the Dome to one-sixth, full size. The subject chosen is the Court of Heaven, as described in the "*Te Deum*." In the centre of the Lantern it was proposed to place a figure of the *Agnus Dei*, on a gold ground; in the circles nearest the lanterns blue Cherubim, and in the spandrels below red Seraphim.

To Thee Cherubin and Seraphin continually do cry.

On the azure ground between the ribs crowds of adoring angels.

To Thee all angels cry aloud.

The Apostles under canopies, one in the centre of each compartment.

The glorious company of the Apostles praise Thee.

At the foot of each rib a throne, with the sitting figure of a Prophet.

The goodly fellowship of the Prophets praise Thee.

By the side of the Apostles, and ranged beneath them, the Martyrs, who are mentioned in the Calendar of the English Church.

The noble army of Martyrs praise Thee.

"The Holy Church throughout the world" might be indicated by a grand procession of figures, of all periods and costumes, in the drum of the Dome, separated from the Court of Heaven by the windows.

This design could be executed in fresco, tempera, or mosaic; if in the latter, it was suggested that gold grounds be substituted for the azure between the ribs. The ribs, with the figures and ornaments upon them, might be executed in stucco in low relief. Thus great richness of effect would be obtained, and the constructional idea of the design thoroughly carried out.

The principles upon which this design was made were in many respects the same as those laid down by Mr. OLDFIELD in his able pamphlet on "*St. Peter's and St. Paul's*," after a careful inspection of the chief Italian domes. He says that the designer of the decoration of a dome should—

Firstly, "endeavour to set off the form and size of the dome by appropriate treatment of the surface," and that he should "arrange all subjects in formal if not actually geometrical compartments, distributed equally around the vault in accordance with its structural uniformity." The idea of construction in an Italian dome is evidently carried out best by diminishing ribs, such as those in St. Peter's, which affords the best architectural parallel to St. Paul's. In St. Peter's there are sixteen divisions formed by coupled pilasters, and from each couple single ribs rise to the apex of the cupola. In this design there are eight divisions similarly formed of single ribs springing from coupled pilasters. As Mr. OLDFIELD says :—"This arrangement at once establishes the arched line of continuity between the cupola and the dome," and, "at the same

time, by distributing the cupola into mathematical divisions and equal sections, it shows the primary notion of its ornamentation to be not pictorial but architectural."

Secondly, "to suggest a proper tone of thought by appropriate figure-subjects," and that "nothing could be more effective" for this purpose "than an overhanging array of simple solemn figures looming above like spirits watching the worshippers below." It was considered that the "Te Deum" suggested a proper tone of thought, and that figures arranged singly, and as little as possible in groups, would tell best when seen from a great distance. The architectural framework which surrounds these figures is in accordance with some of the best ancient examples; for instance, in the mosaics of the dome of the Church of St. George at Salonica, which are amongst the earliest Christian mosaics in existence. The backgrounds of the figures consist of architectural façades, columns, pilasters, pediments, and domes. (See *TEXIER* and *PULLAN*'s "Byzantine Architecture," plates 30 to 33.) This arrangement is most effective.

Thirdly, "to gratify the eye by combined richness and harmony of colour." He further adds that the most important subjects should be kept nearest the eye; that "the scale of the figures should be at once large enough to secure distinctness, yet small enough not to diminish by comparison the height of the vault; and that the figures should be designed with statuesque simplicity, as far as possible in one plane."

It will be seen, on an examination of the drawing, that the rules which he deduced have for the most part been observed in our design. In fact, it shows that my colleague and myself in Florence, and Mr. *OLDFIELD* in London, arrived independently at the same conclusions with regard to the true principles to be observed in designing the decorations of an Italian dome.

R. P. PULLAN.

BAPTIST CHAPEL, SUTTON, SURREY.

THIS building is now in course of erection from the designs and under the superintendence, of Mr. *HERBERT D. APPLETON*, A.R.I.B.A., of the Wool Exchange, E.C., and is attached to the lecture-hall, which, as part of the original design, was erected some ten years ago. The walls are built of undressed flints, with Beer stone dressings. The height of the tower is 80 feet. The chapel, which is 41 feet in width and 77 feet in length, accommodates 550. Underneath the chapel are five large class-rooms, heating chamber, &c. The roof is a hammer-beam roof, 41 feet span. The contract sum for the chapel is 3,899*l.*, and has been taken by Mr. *R. J. HUMPHRIS*, of Sutton.

LECTURE HALL, WANDSWORTH.

THIS building, which adjoins the East Hill Congregational Church, has been recently completed from the designs of Mr. *E. W. MOUNTFORD*, A.R.I.B.A., architect, of 22 Buckingham Street, Adelphi. Besides the Lecture Hall, which provides accommodation for about 350 people, there are vestries for ministers and deacons, various class-rooms, kitchens, &c., and rooms for caretakers, so that the principal difficulty was to arrange all these upon the limited site at command.

The total cost, including hot-water apparatus, and all other fittings, was about 2,300*l.*, and the builders were Messrs. *BELHAM & Co.*, of Buckingham Palace Road.

The Worcestershire Exhibition.—A meeting of the General Committee was held on Saturday at the Guildhall, Worcester, when the report of the Surplus Disposal Committee was discussed. This committee recommended that the surplus of 1,867*l.* from the late Exhibition should be divided among the various institutions in the several towns in the county for the furtherance of science and art.

Antique Art at Oxford.—The committee for making a University collection of casts from the antique report that they have raised 500*l.* of the 800*l.* which they announced as needed for carrying out their scheme. They propose to make a beginning with the smaller sum, hoping that the remainder may be subscribed before long. The incipient collection will be housed in the University galleries, a part of the Taylor Buildings, where room will be found for it by a rearrangement of the Chantry figures, and other economies of space. The committee, however, do not regard this as a final disposition, but think that, for the proper display of a collection worthy of the University, much more is required. They publish a list of casts, either already ordered or to be ordered as money and space are found for them. Subscriptions can be paid to the collection of casts account, Old Bank, Oxford.

THE ORNAMENT OF THE PERIOD.

BY *LEWIS F. DAY.*

(Concluded from page 61.)

YOU may say that we have now no style in which we are accustomed to work, and in which it would come natural to us to repair or add to an earlier structure, and that is true enough (and the more we rely upon copying the less likely are we to form a style); anything we do must naturally partake, more or less, of the character of old work, and, in the case of restoration, of the character of the particular work to be restored. The mistake, as it seems to me, lies in attempting always to make it as much as possible like old work, imitating wherever it is practicable existing details, and seeking before all things for a precedent. Let us leave precedent to the lawyers, and not attempt to measure art with red tape. We know what a mess the lawyers make of it when they meddle with art. The first thought of the artist should be rather to make his work in harmony with the surrounding old work than absolutely like it; and, that much secured, the more of himself he can put into it the more interest it will have for his brother artists. Except for the evidence of the artist's personality in it, none but the most perfect of perfect work would be tolerable. Is not that an argument in favour of work that, poor as it may be, is our own? The old workmen showed that it is possible to be oneself in any craft of which one is master, and if we cannot do so much the more shame for us. Let me not be misunderstood to mean that the artist should ever consciously strain after originality. The evidence of such an attempt on his part is a symptom almost more unpromising than the inertia that is content to let things be, be what they may. Once in the past such an attempt was made, and on a considerable scale, when the Jesuits had the notion of inventing an ecclesiastical style of their own, and a fearful and wonderful order, or disorder, of architecture it was that they devised. There is at least one advantage about its uniform tastelessness, namely, that the student knows, almost for certainty, that the church of the Jesuits will have no attractions for him; and he can safely save himself the trouble, therefore, of turning aside in search of it, or even of crossing its threshold if it chance to lie in his way. The only case I know of in which he would miss anything is in the Church of the Jesuits at Venice.

Originality and individuality will surely come out in a man's work, if only he be free to do what he thinks befitting the occasion, instead of being bound to do as was done on some former occasions. It may well be that the solutions other men may have found for their difficulties may go far towards the solution of the difficulties that confront us. But the world goes on, and not backwards, and to restrict ourselves to the repetition of what has been done is deliberately to put the drag upon progress. There may be no great harm in that sometimes; for the progress of civilisation is up-hill and down-hill, and there are many chances of disaster on the road to improvement. Still the drag is only for occasional use; it is not a means of progress. And if we want to get on, we must rely not so much upon the old vehicle as upon the use we put it to, and the faculties to which we harness it. To drop the simile, it seems to me that we have indeed to possess ourselves of the accumulated experience of the past masters of our craft, and to use it. To stand helpless before it in the attitude of admiration, or to pile it up across our path, so that it shuts us in from doing, is equally futile. It should influence us in all our efforts, as live religion influences our every act. We should refer to it in every emergency, almost unconsciously, as to our conscience. If in designing we were determined to give up our minds to the best possible solution of the problem (and every design is the solution of a problem), we could not solve it without reference to the knowledge which we had acquired from the study of old work. That, therefore, may well be left to take care of itself. Were we to dismiss, on the one hand, all thought of style (which is impossible), and, on the other, all thought of self (which is perhaps no less impossible), we might, having, on the one hand, some knowledge of style, and, on the other, some individuality of our own, arrive at a result worth reaching. What we have to think about is neither style nor originality, neither as to which was the oldest, nor which will be the newest way of doing the thing, but how we best can do it! Of course, we must study old work, and study it with all the earnestness of enthusiasm. And equally, of course, we cannot forget in what we do the styles which went to teach us how to do it. In fact, what we have to do is to digest our learning. Art may be, and architectural art and all that pertains to it must be, nourished to a great extent upon antiquarian research; but undigested archaeology is, nevertheless, not art; and whenever the archaeology asserts itself in our work it is a dangerous sign. If you can pick out bits in a design, and say this was inspired by the nave of such a church, that by the choir of such another, that by the west front of a third, and so on, it is clear that the artist who is responsible for it has not digested his knowledge. There is less danger of this want of homogeneousness where some one fixed style is adopted and adhered to rigidly. Inasmuch as there is a certain unity in the original style, there will be a certain similarity in the bits put together; and that may be reason sufficient to the prudent man why he should restrict himself to a style that is stiff and stark.

But his work will not be really one unless he has assimilated what he has learned. It must have passed into his blood and into his brain before he can claim it for his own. Once it is his, he can do pretty much as he will with it. He can combine then, only then, what he may have gathered from the most various sources. I believe it is quite possible for him to produce work, in which, indeed, you may detect the influence of different styles of art (as you may trace in a man the instincts he has inherited from various ancestors), but you cannot say where the one influence ends and the other begins; you cannot pick out this bit for Greek, that for Gothic, that for Japanese; you are driven to describe it, at length, or to coin a word for it. The subtlety of the art may be tested by the difficulty in labelling it, just as a subtle tint of colour cannot be exactly expressed in a word.

When a style is no longer elastic it is proof that it is dead. No style, while it lived, was ever the cut-and-dried thing we begin by imagining it to have been. There was always change, development, growth going on—and when we confine ourselves, therefore, to the letter of a past style we inevitably lost its spirit. The more you study old work the more you see the wonderful variety in it. The types of the text-books are among the best, no doubt, but they are only instances of types that exist in infinite variety in the old work itself. The freedom, for example, with which the Greeks carved natural foliage is a characteristic of their work which we are left by our teachers to find out for ourselves. There are in the Louvre examples of Greek foliage that seemed to me to have more affinity to Japanese treatment than to anything I was ever taught to accept as Classic. Is not this fact, by the way, suggestive as to the possible infusion of Japanese energy into Greek detail, the possible refinement of Japanese forms to something like Greek perfection? How readily the artists of the Renaissance accepted the Eastern types of ornament into their own style, and assimilated it! You see it in the bulb-shaped domes of Padua, all the more beautiful for this foreign flavour about them—and in certain of the arts, such as damascening, inlaying, bookbinding, and others, the Eastern character of the detail is quite a marked feature of sixteenth-century ornament. That type of Italian scroll-work which Holbein afterwards developed in a manner more of his own, is little more than a characteristically European rendering of details borrowed frankly from the East. This readiness of the men whom we acknowledge to be our masters to embrace within their art whatever was beautiful, is something far more deserving of emulation than the actual forms of art which resulted from that broad catholic spirit of theirs, a spirit which we only mock with little sectarianism!

I have sometimes amused myself by imagining what might have been the effect upon the artists of the Renaissance of a familiarity, such as we enjoy, with Japanese art. It would have been a sort of revelation to them, as it was to us. What use would they have made of it? They would certainly not have been content, as we have been, to import it and to copy it. They would surely have learned something from it, and as surely they would have turned the lesson to account. They would have learned, perhaps, to doubt the necessity for elaboration in ornament, and for that absolute symmetry to which they were inclined.

There is a fund of interest in observing how different nations interpreted a style differently, and the study of their different interpretations cannot but throw some light upon the course we should pursue under circumstances not altogether different. The Renaissance was a trying back, as we are trying back in the present day; but there was not much in common between their free departure from Classic art and our servile acceptance of forms that have not the slightest claim to Classic perfection. And, if the Italian Renaissance was not just a repetition of Classic details, neither was the Renaissance in France a literal version of the Italian, but a rendering essentially French, and allied (not remotely) to Late Flamboyant-Gothic. How the Spaniards enriched the style with a glow of Oriental sumptuousness! There is nothing more gorgeous belonging to the period than is to be found in Spanish and Portuguese art. In the hands of the Germans the forms hardened and assumed a grotesquerie foreign to the South. Even the English of the reigns of Queen Elizabeth and James anglicised it almost out of knowledge, and worked out a style, such as it is, which is unmistakably their own. And, again, in Norway and Sweden (not to follow it further) the characteristic strap-work blossomed, under the new influence, into floriation of a Renaissance, yet none the less Scandinavian, character.

In Italy, to return to the fountain-head, the Saracenic influence goes, in some directions, so far that it was not uncommon in the sixteenth century to introduce mock Arabic inscriptions into the design of textile fabrics. There was no great display of genius in that. It would certainly have been better if they had merely taken the hint given by the admirable ornamental use the Moors made of inscriptions, and put their own mottoes into their own language in a form as ornamental as might be. But their work as it is has at least more interest for us now than if they had merely reproduced in silk or velvet some altogether Eastern stuff.

The style really worth striving after is the style that comes of characteristic and craftsmanlike treatment. It is infinitely more important that our building shall be like brick or masonry than that it suggest Gothic or Classic examples. It matters more that

it should be constructed on principles of common sense than on the lines of old work; that it should be comfortable than that it should be "correct," whatever that may be; and that it should be beautiful than that it should be such as might have been built in the reign of any king or queen defunct. And so with all the lesser arts. The style that comes of workmanlike handling is worth far more than anything that can come of imitation. Why there should be any limit to our scope other than our own powers of expression and the fitness of the occasion, it is difficult to conceive. Say we accept thirteenth-century design as our starting-point, and propose to speak on that text, are we to borrow our sermon also? What we have to say on that subject will, if we are artists, naturally take artistic shape in our hands, and it will shape itself in harmony with the subject. We may say what is in us to say, and quote what we please. If the quotation comes amiss it is the fault of its clumsy introduction—whatever is apt is admirable. If something from Japan or Timbuctoo suggest itself to us as being in harmony with our design, what is to hinder us from adopting it? If we see an opportunity of infusing into it something of Renaissance grace, why not? If we feel that we can accommodate it to modern requirements in a way that was undreamed of by the Mediæval artist, why not? Any fault we make, and many they are, lie in our inefficiency and not in the endeavour. And the only sense in which it is true that we ought not to attempt so much is that we should not try to run before we can walk, but we ought all to look forward to the time when we can march onward on our own account, and not fancy that all we have to do in life is to toddle through the world.

There are many and various definitions of what style is, but practically what is accepted among architects and others as style is always a distinct reflection, if not an actual repetition, of the features of some past phase of art. There is proof of that in the names by which we christen our modern work. It is always Classic, Gothic, Renaissance, or what not, and even the latest-born of mongrels we must needs baptise by the name of Queen Anne. If by style we really meant treatment according to the principles which experience has shown to govern this or that branch of art, we should express it in our nomenclature, and classify styles according to craftsmanship rather than according to date and country. Thus, for example, instead of Egyptian, Greek, and Gothic architecture, we should speak of construction in granite, marble, or stone, and, in like manner, brick, stucco, and even concrete would be credited each with a style of its own. We should classify metal-work not according to an epoch, but according as it was cast and chased or wrought at the anvil. Constructive woodwork would divide itself into carpentry and cabinet-work; its ornamental treatment into carving, turning, inlaying, and the like. The study of style would then be identical with the study of an art or craft, whatever it might be, and the student's attention would be drawn rather to the steps by which it had advanced to its highest point, than to the comparatively accidental character of its footprints by the way. Such study would naturally include the knowledge of any marked impression made upon the art by the influence of the day, and the course of the student would lead him gradually through all the phases of fashion through which it had passed. His faculties would, moreover, be strengthened by this comparative study of all the many stages of his art. He would not compare the one with the others without forming some distinct notion of his own as to which of them was of most vital importance to himself. His thoughts would be concentrated upon the essential fitness of things instead of on the unessential forms that they from time to time assumed. If he did not thus acquire a style more or less of his own, he would, at least, fit himself to meet any and every emergency. The knowledge he had acquired would be neither sentimental nor pedantic, but practical and available, whereas half the learning of the present schools is altogether unavailable for any professional purpose. There is a use, no doubt, in the book-learning that makes a man something more than a craftsman; but, when all is said, the true study-place of the artist is in the workshop, and his best education is in working day by day to better purpose and to higher ends. There is a kind of culture, altogether apart from daily work, that throws a glow of refinement over all we do; but infinitely more ennobling is the cultivating influence of the work itself, and that cultivating influence is in proportion to the breadth of view, the freedom of action, and the possibilities of progress offered by that daily work. The natural growth of the artist is from craftsmanship to art, and many are the craftsmen who have risen in their day (not in ours) to the foremost rank in art. On the other hand, experience shows that the step from learning to accomplishment is not an easy one, and those who begin by knowing all about a craft seldom end in accomplishing anything in it. A man is much more likely to arrive at a knowledge of Gothic principles from the serious study of architectural sculpture than to reach any proficiency in carving after he has mastered the theory of Gothic art. To say that the two studies should progress side by side is to beg the question. They cannot possibly keep pace for ever. One must gain upon the other. Then, which should have precedence? I contend for the growth upwards, from craftsmanship, and do not believe a bit in the growth downwards, from archæology. Culture is the climax of all art, an ideal towards which to strive; it is not a starting-point at all, and your young Crichton, equipped at the onset with all possible culture, never

does anything in the world whatever. It seems to me that our education starts too much from the platform of knowledge, and not enough from workmanship. The beginner is taught to know and not to do. He knows, for example, more about style than he can assimilate long before he can do anything worth mentioning. The future architect can talk architectural jargon before he can so much as contrive a substantial pig-stye. The student of decoration can talk familiarly of epochs and of masters before ever he can draw a scroll, not to say design one. Would it not be more to the point to teach the architect first of all to construct, the decorator to draw, calling their attention to principles only as they affected what they were about? As for style, in the historic sense, that, too, might safely be left till, in the natural course of study, he came to know how the difficulties besetting his craft had been successfully solved in the past. In this way he would not grow up with an inordinate reverence for some one phase of past art. Nor yet do I believe that his work would be destitute of style in the larger and truer sense of that much-abused word.

I started by saying that if a man be possessed by a passion for any one phase of art he must follow that phase—he cannot help it—and I do not see why he should. He will give us his best by pursuing it. And if a man find that he can work best in harness—well, every artist must go his own way to work. Some prefer the beaten road, and some like to feel the turf spring under their feet. What I wish to protest against is the assumption that those who feel that the exigencies of style only trammel them, should allow it to do so, and hinder the free development of their powers. With the knowledge that we have, we must, for the most part, perhaps, start from the standpoint of some existing style (not that I think even that absolutely necessary), and I blame no man for restricting himself even to what has already been done in that style, if it comes natural to him to speak in other men's words, and all he has to say can be so expressed. My sympathy with him would be greater, however, if he proposed to himself to work rather in the spirit of that style; for then he would be a good half-way towards independence. In attempting to follow the spirit of a style, he allows himself to interpret what is the spirit, and in that interpretation any man may well find scope for all himself. Personally, I think that any given style is mainly useful as a point of departure, and I feel myself justified in going as far away from it as ever I please, so long as I come round in time to the point from which I set out. I consider nothing inadmissible which is in harmony with my purpose, and if the whole be in harmony I care not who may say that it is not Classic, that it is not Gothic, that it is not Renaissance, that there is no authority for this, no precedent for that. If only it be fit and beautiful, who but a pedant cares for precedent and authority? Those whose precedent we pretend to follow would have had no authority whatever over us if they had merely followed feebly in the steps of bigger men who went before them. No doubt, fitness and harmony, in defiance of precedent, are infinitely difficult of attainment; but the ideal is worth trying for, at the risk of all failure. And there is hope for all who try—not, perhaps, that they will do anything better than what has been done already, but that they will help to make it possible to be done in the future. They have, at least, the consolation that they are trying to help things on a step (however short a one), instead of gently rolling them back. With all their efforts they may not do much good. They may do some harm; but by resigning themselves to the mere repetition of old forms they may still do some harm, and they cannot do much worth doing. The satisfaction of the purist is not the loftiest aim in art. It has been said of modern religious paintings that they never offend against good taste, for they never aim at anything higher; and in like manner it may be said of those artists, whether architects like you, or ornamentists and decorators like me, who set themselves to task to satisfy the purist in style, that they will do so only by abandoning all hope of individual expression. Any personal utterance would be sure to tempt them from the path of virtue, as the purist understands virtue.

In conclusion, let me repeat that the main cause of complaint against the ornament of the period is that it is as little of the period as it can possibly be. It betrays its date, indeed, but for the most part unconsciously, and in spite of itself. As far as it can it denies the generation to which it belongs. For my part I am not ashamed of the century in which I live; and, though perhaps there have been ages more favourable to the development of art, our only chance of doing anything is to go with the age, and to let ourselves go, looking forwards always, not backwards; and if that implies that we must burn our ships behind us, well, the men who mean to go on are not afraid of that on occasion. One word of postscript. It would have been hopeless in the short hour at my disposal to think of teaching you much, but one may suggest a good deal in a short space of time. With that idea I have simply let myself go to-night, without considering too carefully whither my thoughts would lead me. I do not pretend to have given more than a partial statement of one side of my subject, and I know full well how much remains to be said on the other. I have spoken out in the hope of stirring some among you to think over the ornament of this period of ours (it is what we make it), and whether my words stir you to sympathy or to opposition, is of less consequence than that you should think, and think for yourselves.

The PRESIDENT said they had had an interesting review of the situation of modern art, not, however, so much in regard of decorative art as of architecture, to which, contrary to his expectation, the remarks in the paper had applied rather than to the art Mr. Day was more especially interested in. There was in the Association a class for the study of colour decoration, and he hoped that in the discussion they would glean from Mr. Day some further general principles relating more particularly to decorative art, which would be of service to them. There were certain guiding principles, such as Owen Jones had laid down, with regard to wall and floor decoration, and on these points he believed decorators were generally disposed to agree. Mr. Day he thought had drawn a somewhat gloomy view of the situation, and had taken as an analogy the present unfortunate position of architecture in regard of style. This, the President said, he thought was not the case with decorative art, which he believed had made great progress.

Mr. STANNUS, who proposed a vote of thanks to Mr. Day for his paper, said that Mr. Day had left them nothing to say. The well-known combative spirit of the Association was easily roused when they dissented from the views of the lecturer. Mr. Day had spoken ably as to straining after originality, which was the curse of true art, and he had justly condemned the practice of trying to run before one could walk. He had spoken of following in the footsteps of the past, and rather condemned it. He hoped Mr. Day did not condemn the study of style, for strict attention was given to this in the Elementary Class of Design. Mr. Day, where he alluded to style growing upwards, had in one sentence laid bare the truth in regard to all style. It was important to recognise this in an age where technical treatment of any style seemed almost lost. Wood-engravers treated their material as though it were steel, &c., just as in musical symphonies now the parts for trumpets would be often written as if for violins. Thus it was well that students should hark back to first principles, and to a style founded on workmanlike treatment of material. Mr. Day had spoken on the mock Arabic inscriptions on silkwork, and no doubt he would tell them that they were copied from Sicilian work. It was probable that the men who copied them did not know that they were inscriptions at all, but took them to be a kind of scrawly ornament. Mr. Day had hardly, though, taken into account what a tremendously analytical age the present one was. The panorama of styles should lead the analytic mind to weigh, not which were the best styles, but what were the best features in each style in regard of certain materials, requirements, &c.; and it was for them, as architects, after analysis, to weld these features together as a whole. Whether they liked it or not, the fittest would survive, and they should help on that survival by finding out what features were the best and fittest to survive.

Mr. COLE A. ADAMS seconded the vote of thanks. He observed that Mr. Day had given expression to the feeling abroad that the time had come when a departure was necessary from the principles that hitherto governed art. This feeling had been carried out in the Gothic revival, and it was still manifest among the great masters of the present day, for there were still great masters, though the list was getting very short. The student's position in other periods of art was easy, comparatively, when students were brought up and trained in the school of a great painter or sculptor. Nowadays the student was bewildered by a multiplicity of styles, and after making choice of a style he might find it was not in fashion, and therefore was not bread-and-cheese for him. He hoped Mr. Day would make some suggestions as to a course of studies. He wished it were possible to have men pre-eminent in their art, followed by schools; men who would lead their disciples and direct them in their studies. He hoped in time some principles of study might be evolved which would lead to results such as in the days of the great painters and sculptors. Many steps would then be bent to one goal, instead of straggling to the four quarters of the world.

The PRESIDENT put the vote to the meeting, and it was carried by acclamation.

Mr. DAY, in the course of his reply, remarked that he had already said all he had to say on the matter. It was all very well to propound principles of ornament. Owen Jones's had been referred to, and no doubt they were most useful, but they overstepped the mark in being too definite; otherwise they would have been more practical. They were not, in fact, principles, but rather recipes or working "tips." Alluding to the President's suggestion that he might have spoken more of ornament than of architecture, Mr. Day said that, as an ornamentist and designer, he had suffered from the architect, who had been down upon him. He had spoken feelingly of architects as a restraining influence; and if the architect had done his best to suppress him, and if he was still able to stand up, it was not the architect's fault. He did not mean to say that students should not learn style; they must master it before anything else, but the teachers should use it rather as explaining working principles, and by way of illustration, than anything else. Clients would be apt to try and force them in matters of style, but he advised them not to bother themselves more about the question of style than they could help. A remark he had made before, and which appeared to have acted rather like a red rag to some, was that, in his opinion, the art of the future must be a sort of wise eclecticism.

THE KNIGHTSTONE COMPETITION.

THE owners of the island of Knightstone, Weston-super-Mare, advertised in October last for competitive designs for laying-out and utilising their property either as a public resort and place of amusement or otherwise, offering a premium of fifty guineas for the scheme best adapted for the purpose. Nine sets of drawings were sent in by local and other architects, and the same having been referred to Mr. Wm. Bruce Gingell, architect, of Corn Street, Bristol, the premium was awarded to Mr. H. Jones, architect, Bridge Street, Bristol, for his designs under the motto or *nom de plume* of "Justitia." The selected scheme comprises well-appointed Turkish baths of Moorish design, a marine hotel, billiard-room, with reading-room and library adjoining, and a pair of detached boarding-houses all in the Italian style of architecture, with ornamental band-stand, rockery, and flag-staff, and suggestions for laying out the vacant grounds.

EGYPTIAN REMAINS.

A LETTER has been printed from Sir W. H. Gregory, in which he suggests European interference through a joint commission, to prevent the destruction of the remaining examples of Arab art in Cairo:—

It will be remembered, he says, that in December 1881, a commission was appointed by the Khedive for the preservation of Arab monuments, and upon it were placed names which gave some hope that it was not to be a dead letter. I was informed that a sum of 7,000*l.* a year was to be expended, according to the recommendation of the commission. It was stated to me on good authority that Mahmoud Samy Pasha, the President of the Council, now in exile, was thoroughly in earnest in the matter, and took a very enlightened interest in it. I spoke to Arabi on the subject. He seemed to be quite indifferent to all arguments from an artistic point of view; but when I asked how he could expect Christians to respect the religion of a people who had so little respect for their sacred places, he quite recognised the force of the appeal, and said, as I believe in all sincerity, that he would warmly support the commission. Then came the Egyptian troubles, and what has happened since I know not.

Sir W. Gregory next speaks of the Boulak Museum, the most interesting Egyptian collection in the world, and, until recently, when the immense addition of objects from the marvellous find of Royal mummies at Dair el Bahari created a block, the best arranged and most instructive. At present, he says, this museum is in imminent danger of being consumed by the first fire which breaks out in the houses which surround it, one of them close adjoining being, if I am rightly informed, a brandy store. I need hardly comment on the conflagration which might ensue from a spark of fire falling among such inflammable materials as are stored in every room of the museum. This danger of fire in a far less degree has induced us to remove a block of buildings contiguous to the Houses of Parliament, and similar precautions at a slight expense would secure the safety of the Boulak Museum. The next point I would urge is the building of a house for the director. The house built for M. Mariette has become uninhabitable, and the present unfortunate director, M. Maspero, has no other habitation than his steamboat, which being moored under the bank on which the museum stands is actually stifling during hot weather. No one deserves better treatment than M. Maspero, who is a credit to the institution over which he presides, from his learning and activity, and whose courtesy will be readily acknowledged by all who have the pleasure of his acquaintance. It is painful to think that the health of those nearest and dearest to him has been seriously affected by the want of proper accommodation, which is due to so eminent a man. Lastly, I would urge that the ownership of the Boulak Museum should be settled. I understand that it was claimed by the late Khedive as his private property. If the claim be allowed it would be at the mercy of his creditors, I presume. I am not aware if the present Khedive advances similar pretensions, but it seems to me impossible to admit that a collection entirely made by public expenditure, and not from the private resources of the Khedive, can be otherwise than national. Much of the interest taken by Europe in the Boulak Museum depends on this question of ownership.

At this moment there are plans for systematic and thorough excavations in Egypt to be supported by voluntary contributions, and it is probable that subscriptions sufficient to produce important results will be procured. It may be sufficient for scientific purposes that the inscriptions discovered should be photographed, and that the other objects dug up should be dispersed throughout the world, and go *en bloc*, like the Cesnola collection, to New York or elsewhere. But I am convinced that contributions would be scanty enough if such were to be the result. The subscribers would be perfectly willing to avow self-abnegation, so far as their own country is concerned; but the greater part would insist on the objects being placed and remaining permanently in the national Egyptian Museum. The chief subscribers to an exploration fund would not be the votaries of purely scientific research, but persons

who take delight in the art of a wonderful and enlightened race, living at a period which it almost makes one dizzy to look back to. They would undoubtedly demur to the chance of the proceeds of their expenditure being converted into pocket-money for this or that Khedive.

THE NEWLAND MILLS CHIMNEY.

AT the inquiry before the borough coroner for Bradford on Monday technical evidence was given by Mr. John Waugh, C.E., who had been assisting Lieut.-Col. Seddon in investigating the causes of the fall of the Newland Mills chimney. He said he was first on the ground on January 9, when he saw the stump of the chimney and the fallen *débris*. The material of which the chimney had been composed was very much crushed and broken. He found a greater quantity of powdered lime than he had anticipated. He did not find any large portions of the chimney adhering together. There were also more large lumps of mortar evidently from the hearting or backing than he expected. He noticed that the lime in the mortar had not been riddled. The mortar used for the outer casing was of a much better quality, and had been riddled. That also applied to the mortar on the red-brick lining. He found some of the mortar and the stones in the backing coated with soot, which he also found upon some of the stones that had formed the outer casing. Soot was also in the joints of the outer casing; some soot-stained stones were among the *débris* on the side of the yard towards which the chimney fell, and others near the base of the chimney. The outer casing seemed to have been well jointed. On some of the joints he found both mastic and cement, which indicated that the chimney had been repaired at some time. Generally speaking the stones he found in the ruins had less of mortar upon them than he expected. On examination of the stump of the chimney he first tried the diameter of the inner casing about the ground line, and found the measurement in one place 10 feet 6 inches, and in another 10 feet 4 inches. He afterwards ascertained that the diameter of the inner case at the base had been 9 feet 8 inches, leaving a clear cavity of 6 inches. The difference was caused by the "buckling" of the firebrick lining in consequence of the weight above making it settle down. He found four vertical cracks in the firebrick lining, accounting for the cavity of 6 inches. The centre crack terminated at the top of the archway of the flue, where it formed the letter V. The archway of the flue was perfectly sound. He traced the extreme cracks on each side right to the bottom. All the cracks were old, as evidenced by the soot found in all of them to their full depth. The soot deposits were not recent, but very old. There was a "buckling" of the firebrick lining on the south side. At one point part of the firebrick lining had gone, but that might have been caused by the falling of the chimney. The firebricks were good, and had not been injured by the heat from the flues, and they had been laid in good mortar, but not in fire-clay. The mortar was not crumbled away, but possessed the qualities it ought to have. The bricks were laid in header and stretcher courses, and they must have been displaced from some cause other than that of the heat. In the lining the red bricks were in splendid condition. They were laid in heading courses, and there were no cracks in them. He did not see any binding in the hearting of the brickwork in the portion of the stump left standing, nor between the firebrick of the red-brick lining. The gases must have had free access between the red-brick lining and the hearting, as indicated by the presence of soot. If there were cracks in the hearting they would find their way to the outside casing, where he found some soot. The backing was composed of materials commonly used for that purpose, and was neither better nor worse than he expected to find. He, however, found mortar in larger lumps than he expected to find it in such a class of work, but the stones used were of the class commonly employed in dry walling. He found remains of a great many "throughs" that had been broken. These "throughs," the fractures in some of which were old, while in others they were new, had gone from the outside casing to the backing, but he found none that had gone through to the inner casing. The backing beneath the ground line was in an excellent condition. It was as solid as a rock, and had to be quarried out. The outer shell below the ground level was good. The outer shell was not connected with the backing by any "throughs," so far as he could see.

The Coroner.—Can you form any opinion as to the cause of the cracks in the firebrick lining?—The cause was settling of the chimney in more than one direction. This settling might be attributable to the wind, to the subsidence of the foundations, or the operation of straightening the chimney. Any of these causes would be assisted by the natural expansion of the firebrick lining itself, as a result of the heat from the flues. This should have been left to expand independently.

To what do you attribute the bulging of the chimney, as described by the witnesses?—To the subsidence of the backing or hearting. This subsidence has taken place on the sides where the cuts were made. At first there would be cracks caused by compression of the hearting, followed by cracks and bulges. I should expect the breaking of the "throughs" to follow as a consequence of this subsidence. There would, however, be plenty of

"throughs" higher up that were not broken. The outer case would still have a tendency to support the structure, but that support would be diminished when it began to bulge out.

In your opinion what was the cause of the fall of the chimney?—In my opinion the fall of the chimney was attributable to the mode adopted in straightening it. The first cut was made between the lower "eyes" and the lower long panels. The mode adopted, as described by the witnesses, was in itself calculated to put a limit to the existence of the chimney, which ought to have stood almost for all time. By the drawing out of the iron wedges after the first cutting, the chimney was brought over to the other side and more than half its weight thus came upon that side. The second cutting was the death-blow of the chimney, as it shortened its eye very materially. The chimney was cut through twice at points about 3 feet apart. After that the bottom of the chimney would be as solid as rock, and all the vibration would be upon the space between two cuttings, which would be gradually pounded and crushed by the weight above, some 2,200 tons, or equal to 6·8 tons per superficial foot, supposing the weight to be uniformly distributed. In periods when a high wind was blowing, however, the weight might be brought almost entirely over upon the side where the cutting took place, and the pressure per superficial foot would be at least double. When the wind blew the chimney would rock as all chimneys rock, and the material in the space between the two cuttings would be crushed and pounded. To me the wonder is that the chimney stood so long. The same cause that cracked the outside would crack the inside. I have no doubt that if the shaft had been examined internally it would have been found to be bulged inside correspondingly with the outside.

By Colonel Seddon: When the chimney was brought over it must have pounded and compressed everything before it, until it found a sufficient bearing area without further compression. Considering that it was a live and not a dead load, that pressure must have been more than double what it was ordinarily. That would be liable to cause cracks in the base of the chimney, such as I found evidence of. Such cracks would be liable to extend through the rocking of the top portion, which, therefore, was probably rocking on a cracked base. Passing to the latter days of the chimney, it was reasonable to expect to see slight cracks on the outside. That they should gradually widen by the rocking motions and develop into bulges he should expect. That the more the outer case gave way the more the backing would yield and the more the chimney would get out of plumb he should also expect. What had actually happened was just what he would expect. Portions of the outer case fell out gradually; then a high wind coming, as it did on the Wednesday night, led to a further pounding of the weak part, and a further and a larger fall on the Thursday morning; and then the weight above, pressing upon the unfortunate 2 feet or 3 feet, would cause it to burst out at the very part, then to subside vertically, as narrated by three of the witnesses, crushing and being crushed until it heeled over and fell upon the mill in a south-easterly direction. Witness did not think that the temperature of the gases that entered the flues, which would not be more than 450 degs. Fahrenheit, had anything to do with the fall of the chimney. There were only fifteen boilers sending their smoke into the chimney, and economisers intervened between them and the chimney. The heat he had mentioned would not injure good firebricks. The foundation yielding was, in his opinion, the primary cause of the chimney having to be straightened. An old coal-pit would not commend itself to his mind as a suitable site upon which to erect a chimney intended to be 100 yards high and 4,000 tons in weight, upon an area of 30 feet base, although shafts were sunk and filled up with cement. If he had had to build a chimney there he would have started to erect it from the seating of the coal. The difficulty of packing old coal workings is notorious. On examining the ragstone foundations he found nothing to account for the fall of the chimney, which would have been standing now if it had not been tampered with in the straightening. Still, he thought that the leaning of the chimney when it had got 70 yards high was attributable to the giving way of the foundations. It was possible that if a piece of work had been carelessly done it might have canted during the night, as the chimney was described to have canted by Illingworth, the foreman of the masons. There was nothing in the levels of the foundations to account for the chimney being 3 yards out of plumb at the top when 70 yards high. He imagined that the foundations gave way at one point at first, and that the weight of the chimney being brought over by the cutting operation would level it again.

By Mr. Atkinson: It was much easier now to account for the fall of the chimney than to have anticipated it. Unless the history of the chimney had been known, a safe opinion as to the strength of the structure could not be formed. If he had not known that the chimney had been cut he would not have expected it to fall; but had he been told that it had been cut, he would have wanted to know the reason for the bulges. To an unskilled person it would be more difficult to anticipate such a result. He had heard of brick chimneys being cut, but never of a stone one before this. In a brick chimney the courses were uniform; brick chimneys were generally strengthened by sawing through the mortar.

Mr. Scott: If you had been called in to give an opinion on this

chimney should you have suggested an examination of the internal part?—I should have suggested a thorough examination, both inside and out.

And the examination of the inside would have revealed a different state of things from the outside?—It would have been the combination of the appearances of the inside and the outside that would have alarmed me.

By Colonel Seddon: I cannot understand why a cut should have been made 18 yards up the chimney to rectify the effects of a subsidence from the foundation. I am of opinion that all the "throughs" put in by Woodman, "the steeplejack," when he strengthened the chimney would break when the weight came over.

Walter Woodhead, recalled, said that after the bulging was pulled down he saw a crack in the face of the hearing into which he could put his fingers. He saw the crack from the ladder, but could not see it from the ground. Mr. Humphreys, and probably Mr. Webster and Moulson, were present when witness saw it. He could not say whether or not they saw it. He did not remember having mentioned to either of those gentlemen that he had seen the crack. He believed that the crack in the hearing was a continuation of the crack in the bulge, before it was removed.

THE DECAY OF BUILDING STONES.

A MEETING of the architectural section of the Philosophical Society of Glasgow was held on Monday when, after some formal business had been disposed of, the chairman, Mr. James Sellars, called upon Dr. Wallace, president of the society, to deliver a specially prepared address on the subject of "The Decay of Stones used for Building Purposes."

Dr. Wallace said the subject he had chosen was one of great interest to architects, and that fact alone would have to be his excuse, as a chemist, for intruding himself upon those engaged in architecture and building construction. Any casual observer could see the differences in the rocks brought to view by the operations of nature. Some remained firm and hard after countless ages of exposure, while others had crumbled into dust. In architectural work the instances were no less striking. Many of the ancient monuments of Egypt and Greece showed at the present day not the slightest traces of decay, while in this country old buildings had suffered greatly, many of them only being preserved by a careful system of renovation. The principal building stone employed in this country—if they excepted granite, which was only used in one district—was sandstone, or, as it was generally called by builders, freestone. Limestone was only occasionally used. He then alluded to the difficulties met with by builders and architects in choosing a stone, and stated that he had been supplied with twelve specimens, representing well-known quarries, by Messrs. Watt & Wilson, and a table was exhibited containing the results of a series of tests and examinations to which they had been subjected. The various specimens having been referred to, Dr. Wallace proceeded to explain what sandstone was, and the special characteristics of the various blocks submitted to the meeting. Sandstone containing too much clay was a weak stone. Some of the whitest specimens contained more oxide of iron than those of a reddish tint. By the fire test some white specimens turned reddish while others of a naturally red tint became almost perfectly white. The quantity of lime in a stone affected its weight. While one specimen weighed 144 lb. to the cubic foot, another only weighed 127½ lb. The most porous of all the specimens seemed to be that from Wemyss Bay. Sandstone was all the better the less water it absorbed, and the white stones had all this quality, as the reddish specimens were liable to decay quicker. In some cases the stone decayed in such a way that nothing but the sand was left, and it could be lifted off by the hand, while in other cases it came off in scales. To show the porous nature of sandstone, a cube was then exhibited, coated with paint on four sides, and fixed on a stand with gas under it, which found its way through the pores of the stone and burned at the top. Another specimen was shown which had been pierced to a certain extent, and water being allowed to run into the bore dropped through into a receptacle below as if passing through a filter. A block was also produced which had been put into a flat plate of water for about an hour, when it soaked in 1½ inches. The same stone, having been left overnight in the same position, was found to be damp on the top surface when examined. It was thus shown that sandstone was very porous, and when a moderate shower of rain fell it was entirely absorbed by the blocks used in buildings, and this going on for years told upon the material. In large towns there was sulphur in the air, and the rain contained as much acid as reddened litmus paper. Window sills, lintels, and projecting portions of a building caught the rain, and it found its way through the stone to a lower level. In this way a great deal of damage was done. After speaking of the styles of architecture best adapted to a wet climate, Dr. Wallace mentioned the several modes in use for preserving stones, including a new preparation known as the "damp repeller." In conclusion, he said that before a house was

safe for habitation all the water ought to be evaporated from the walls, both outside and inside.

Several members then gave their views, and it was pointed out that the stones taken from a particular quarry did not always turn out the same.

In replying to the observations made, Dr. Wallace said the Council Chambers in Ingram Street had been built of stones from Kenmuir, and it proved that stones from the same quarry were not all of the same quality. A great many buildings were erected with stones from the same quarry in West George Street and Bath Street. They were fine old buildings, and stones showed no signs of decay, although for long they had been exposed to the same influences as those which had so quickly decayed in Ingram Street. No doubt inferior stones had been got out of the quarry, but some of the old stone, judging from the specimen produced, still remained.

ENGINEERING WORKS.

Electrical Railways.—Mr. Wm. A. Traill, in a letter to the *Pall Mall Gazette* in reference to the Giant's Causeway and Portrush Electric Tramway, says:—"As the engineer and constructor of this tramway, you will allow me to amend a few particulars in your recent article, as the concluding sentence is rather sceptical as to our prospects of financial success, even granting that the working of our tramway by electricity be successfully carried out. In all such companies the prospects of dividends largely depend upon the first capital cost, or total cost per mile, but instead of, as is stated in the article referred to, raising 45,000*l.* to construct six miles of tramway, or at the rate of 7,500*l.* per mile, we are now able to assert—and can do so with full assurance, as our tramway is now complete—that our total prime cost will be less than one-half this sum, or about 21,000*l.* for six and a half miles of tramway, and inclusive also of the cost of buildings, rolling stock, electric plant, engines, law, Parliamentary, and engineering expenses. The 'sanguine estimate of the promoters'—to the fact of our having no promoters our success is due—is stronger now than ever, and the experimental working hitherto of our electric motive power amply justifies a continuance of our 'sanguine estimate.' With regard to the working, I need only mention that our electric car is able to ascend a long continuous hill of about one and a half mile in length, and with a gradient of one in thirty-five, drawing a second car behind it, and work as readily and as well at a distance of two miles from the generator as adjacent to it. Although in a 'remote corner of Ireland,' we are not here disturbed by the troubles which distract our unfortunate country elsewhere, nor are we devoid of enterprise in offering the additional attraction to visitors to the Giant's Causeway of being carried there on an electric tramway."

The Tay Bridge.—A large number of men are now employed in making excavations for three of the land piers of the Tay Bridge, on the Fife shore, and at other preliminary works. On the other side one of the new piers has been founded, and inshore from this the rock is being removed to allow of one of the old brick piers being lengthened and widened. Further out, again, the foundation of a third pier close to the open-air swimming pond and at the side of the river is being prepared. A pontoon has been floated out close to the bowstring arch of the old bridge with a cylinder. A similar pontoon, for the sinking of the cylinders on the south side, is in the course of construction. A large number of portions of cylinders ready for being put together are now stored in the contractor's yard. The works are being carried on under Mr. Inglis, the contractor's resident engineer.

LEGAL.

Leicester Assizes.—Nisi Prius Court.

(Before Lord Justice COTTON.)

A BUILDER'S CLAIM.—RATCLIFFE v. WOOD.

The plaintiff in this case, a builder, carrying on business at Leicester and elsewhere, claimed from the defendant, a broker, &c., at Atherstone, the sum of 170*l.* 17*s.* 1*d.* for work done to his premises. Counsel, in opening the case, said that the plaintiff entered on December 9, 1881, into a contract with the defendant to do certain work to his premises at Atherstone. Messrs. Harding & Topott, architects, Leicester, were entrusted with the professional portion of the work, and they advertised for tenders for the work. Several people tendered to do the work, and amongst others the plaintiff; and though his tender was not quite the lowest, he was, by the advice of the architects, accepted by the defendant. Accordingly a contract was entered into with the plaintiff to do the work for 130*l.* The contract provided that all matters and things in dispute relative to the contract should be referred to the architects, whose version and decision in all such matters and things should be final and binding without appeal. Then the contract further provided for the contingency of there being alteration in the original contract, and the clause in the contract was to the following effect:—"It is agreed that all prices for extras shall be based

on the schedule of quantities with which the architect is furnished; and it is further agreed that such architect shall have the power to order, by writing or verbally, all alterations to be made in the building during the progress thereof, such alterations not to annul this contract, but shall be duly performed, and the value shall be ascertained and certified and added or deducted from the contract sum." Shortly after the date of the contract the plaintiff found, on proceeding with the work, that the floors were giving way, and that it would be necessary to have new floors. He communicated with the defendant upon the subject, and defendant communicated with the architects, and orders were given for the work to be carried out. Then the defendant thought he should like to have his shop extended, and accordingly those alterations were made by the order and sanction of the architects. A variety of other works were done, and a much greater expense was incurred. The result was that the extras amounted to 320*l.* 10*s.* 8*d.* As the work proceeded the architects gave their certificates that the work was satisfactorily done, but the amount certified had not been paid. The question was whether the defendant was entitled to go behind the certificates of his own architects and say that the work was not properly done. He had pleaded that the certificates of the architects were obtained by fraud and collusion with the defendant, but that would have to be proved to the satisfaction of the Court.—The plaintiff deposed to the facts stated in the opening, and said that the whole of the certificates amounted to 320*l.* 10*s.* 8*d.* Of that amount he had received cheques on account, bringing the sum down to 170*l.* 17*s.* 1*d.*, the amount claimed.—Mr. Harding, architect, Leicester, said that he conducted the transactions of the defendant, and issued certificates to the plaintiff. They measured the work as far as could be done, and estimated the remainder at contract prices. Witness regulated his valuations by the contract entirely, and he believed the work gave satisfaction to the defendant. The general instructions of the defendant, however, were to cut the matter down as much as possible.—Cross-examined: We declined to give a copy of the contract agreement and specifications to the defendant as he did not wish to pay for them. He would not be able to check our prices unless he had a copy of the specifications and agreement. I took the plaintiff's figures without giving the defendant an opportunity of checking them as to the number of hours employed, nor did I go through the quantities supplied by the plaintiff and check them with the defendant. I did not give the defendant any opportunity of checking my figures in any way, as I did not think a man brought up as a tailor could check my figures. At this stage plaintiff's counsel applied to amend his particulars, upon which Mr. Dugdale, for defendant, said that if his friend wished to amend he should like his lordship to say that he should like the plaintiff to pay the costs.—His Lordship: I will allow you to offer to pay to the court such a sum as you think you ought to pay.—Mr. Dugdale: I am informed that the 170*l.* is in court.—His Lordship: Do you tender that sum?—Mr. Dugdale: No, I tender half of it. I think I am very liberal. I will apply to amend by paying 85*l.* into court. His Lordship: Then I give plaintiff liberty to amend on the defendant paying into court 85*l.* in satisfaction of plaintiff's claim.—Mr. Burton, surveyor, Leicester, stated that he had seen the work done, but had taken no measurements, and had simply taken notice of the quantity of the work done.—In cross-examination, witness said he spent about half an hour in the building, and thought the repairs had been admirably executed.—Thomas White, who had been engaged in bricklaying work on defendant's premises, said that on the last Sunday he spent at Atherstone he dined with the defendant, who expressed his satisfaction with the work, and said he would be willing to pay 300*l.* for it.—Mr. Dugdale, having addressed the jury for the defence, called in support of his statements, Mr. Benjamin Wood, defendant, who said that when he was charged for extras by the defendant he asked Mr. Millican, surveyor, Leicester, to come down and examine the work. He had not expressed himself satisfied with the work as detailed by one witness. When cross-examined witness said he did not remember saying to the plaintiff and his workmen that he was satisfied with the work. He only made the usual after-dinner speech. He believed there was a conspiracy against him by the architect and builder. Witness was promised a copy of the specifications when he signed the agreement.—Mr. Millican, Leicester, said he was called in by the defendant and supplied with the schedule of prices. He afterwards proceeded to the defendant's place of business, and he pointed out the work to him. Witness measured the work, and struck out from the contract what had not been done. The additions after allowing deductions amounted to 97*l.* 7*s.* 6*d.*; that added to the contract would make 226*l.* 7*s.* 6*d.*, and the whole amount to be paid into court would be 62*l.* 7*s.* 6*d.*, instead of 85*l.* as just paid into court. That was a fair and reasonable charge for the work done.—Mr. Buszard (to witness): You are an architect, sir? I am.—And it's no use cross-examining you, is it? You never depart from what you say, do you? Witness: No, because I believe I am right.—When there are any cases of this sort here you are always called, and you always say the same, don't you? Yes, pretty much so.—Mr. Buszard: Yes, I know you do.—In further cross-examination witness said he knew Mr. Burton, one of the witnesses for the plaintiff, but did not think that he had had as much experience as any one in Leicester in the checking of a contract.—This concluded

the case, and his lordship having addressed the jury on the merits of the case, the jury returned a verdict for the full amount, less 11*l.* 11*s.*, the fees of the surveyor.

NEW BUILDINGS.

Garlands Asylum, Carlisle.—The contract for building a female junction block at Garlands Asylum has recently been let to Messrs. Beaty Brothers, builders, Carlisle, and was commenced on February 1. The whole will be built, as usual, with red Newbiggin stone, relieved with white quoins and strings. This block will complete the enlargement, which has occupied over four years, and has all been entrusted to Messrs. Beaty, whose excellent red stone quarries are very convenient for this work. The total cost of the enlargement, for 400 to 600 patients, will cost over 25,000*l.*, and has been carried out in portions, so as to keep all things in working order. The total length of the main front is about 1,000 feet. The heating and steam power for works has been carried out by Haydon & Sons, of Manchester, under the management of Mr. Blake, and is very satisfactory. The plans, from the beginning of the asylum, some twenty-five years ago, have all been prepared by Mr. Cory, architect and county surveyor, Carlisle; and, although this is the second enlargement, the whole are grouped together as convenient as if they had been designed at one time. Mr. Plant has been clerk of works for over five years, through whose efficiency the works have been effectually done, and many of the lavatory and other fittings are from his own designs, and are most complete. The above Newbiggin red stone quarries are considered amongst the oldest and best red stone in the north of England, and some of the heaviest works in the district have been built from them. This stone is now having a large sale in London and elsewhere.

Dunfermline.—A new bank is about to be erected in Dunfermline. It will be in the Classic style, and is to be three storeys high, besides basement floor. There will be a portico in the Roman-Doric order at each of the principal entrances to the bank and agent's residence. The telling-room is to be a spacious apartment, 30 feet by 21 feet, with a large oriel window looking into Abbot Street, and will be fitted up in the latest and most approved style. Messrs. Wardrop & Reid, Edinburgh, are the architects. The contractors are Messrs. George Birrell, Mitchell & Kinghorn, G. Robertson, Jas. Bonner & Son, and R. Anderson—all of Dunfermline; Mr. Tait and Whytock, Reid & Co., Edinburgh.

CHURCH BUILDING AND RESTORATION.

Stourport.—Some alterations with regard to the internal arrangement of the parish church at Stourport are proposed to be carried out. Plans of the contemplated works have been prepared by Mr. Meredith, architect, of Kidderminster.

Cornwall.—The Church of St. Kew, Cornwall, is being restored under the direction of Messrs. Hine & Odgers, which it is expected will be effected by next May. The church plate of St. Kew is almost of unique interest, and includes a hanap or chalice, of English manufacture, of the date 1598. It is a fine specimen of Renaissance art in silver. The bowl was lost, and the work has been entrusted to a well-known ecclesiastical metal worker for restoration.

Selby.—A new Wesleyan Chapel has been opened. The chapel has been built from the designs of Messrs. Waddington, architects, Blackburn, and is in the Romanesque style of architecture. Mr. G. Mansfield, of York, is the contractor, the sub-contractors being Mr. Swaine, Selby, for painting; Mr. Swift, Selby, plumbing; and Mr. Wand, York, plastering. The total cost of the chapel and schools has been 6,500*l.*

Middlesbrough.—The top stone of the new spire for St. John's Church has been placed. The work has been carried out from the design of Mr. Alexander by Mr. Thomas Dickinson, of Saltburn.

SCHOOL BUILDINGS.

Bromsgrove.—A new school erected in connection with King Edward's foundation at Bromsgrove has just been opened. The building has been designed in the Queen Anne style, and is erected in red brick, relieved with round oak stone, and forms a parallelogram two storeys in height. The whole of the upper floor is utilised as the school hall, while the lower floor is divided into four rooms—the laboratory, library, sixth form room, and class-room. The building is well lighted and ventilated, and the gasfittings have been provided by Messrs. Thomason & Co., of Birmingham. Messrs. Brazier & Weaver are the contractors, and Mr. John Cotton, Birmingham and Bromsgrove, is the architect.

Birkenhead.—The foundation-stone of new schools in connection with St. Luke's Church, Lower Tranmere, Birkenhead, has lately been laid. This is the second of the three schools intended to supply the educational wants of the borough, and so avert the

establishment of a School Board. The new schools, which will accommodate 900 children, are to occupy a site at the west end of St. Luke's Church. The buildings have been designed by Mr. G. E. Grayson, architect, Liverpool; and the plans have been arranged to admit of future extension, with further accommodation of from 300 to 430 children. The contract for the first portion of the works has been entrusted to Messrs. A. Bleakley & Son, Birkenhead.

Lydbrook.—The Joys Green School buildings were formally opened for scholastic purposes on the 15th ult. They have been erected for the Forest of Dean U. D. School Board, from the designs of Mr. A. Smith, architect, of Mitcheldean, and provide accommodation for 270 children. The walls are constructed with grey Forest of Dean rubble stone, and the roofs covered with blue slates. The buildings, which comprise schools with teacher's house detached, present a picturesque appearance, being Gothic in style, and situated upon a hill overlooking the River Wye with its attractive scenery in the valley beneath. They have been built by Mr. Thomas Foster, of Abergavenny, at a cost of 2,960*l.* Mr. Leary, of Bristol, carried out the heating arrangements in an efficient manner.

GENERAL.

Royal Academy.—At a general assembly held on Tuesday evening Mr. R. W. Macbeth, painter, and Mr. E. J. Gregory, painter, were elected Associates.

Mr. Edward Freeman has resigned the post of acting secretary to the Society of British Artists, and in the autumn will inaugurate a new series of exhibitions, to be entitled the "Nineteenth Century Art Society," at the Conduit Street Galleries.

Mr. William Robinson, of the Manchester Academy of Fine Arts, has gone on a sketching tour on the shores of the Mediterranean, in the neighbourhood of Mentone.

A Town Hall is to be erected at Marlborough, and Mr. C. E. Ponting has been commissioned to prepare plans for the building.

Professor Kerr will deliver a lecture on "Classic Architecture" at the London Institution on February 8.

Wall Paintings, supposed to date from the latter part of the thirteenth century, have been found beneath the whitewash in Munster Cathedral.

The Parish Church of Thornton Curtis, in North Lincolnshire, one of the most ancient of the county churches, is to be restored.

A Stained Glass Window, executed by Messrs. Lavers, Barraud, & Westlake, of Endell Street, Bloomsbury, has been placed in the south aisle of Norwell Church.

The Exhibition of the Royal Scottish Academy will open in Edinburgh on the 17th inst.

A Painted Glass Window has just been received at Lerwick for the Town Hall from the burgomaster and magistrates of Amsterdam, in commemoration of the services rendered by Shetland to seamen and fishermen of Holland.

The Narrow Gauge Railway between Valetta and the central part of Malta will shortly be opened for traffic. In length it is about seven miles.

The Annual Exhibition of the Glasgow Institute of Fine Arts will open on Tuesday next.

A Meeting has been held in Glasgow, at which it was resolved to raise between 500*l.* and 600*l.* to defray the expenses for the meeting of the Sanitary Institute, which is to be held in the City during the autumn.

The Project for constructing a plateway from Liverpool to Oldham and Barnsley has been abandoned. The estimated cost of plans, references, surveys, and the application to Parliament, was 75,000*l.*, and towards this sum the promoters guaranteed one-half, leaving the other to be subscribed by the public.

The Project for a High-Level Railway in Vienna has been sanctioned by the Emperor of Austria. A company is to be started with a first capital of 60,000,000*fl.*, one half in shares, the other in preferential bonds. There are to be two boards—an Austrian and an English one; but all employees are to be Austrian subjects. A portion—or, according to another version, the whole—of the iron used is to be supplied by Austrian firms, with some of which contracts are said to have been already concluded. A period of four years is contemplated for the completion of the line. Mr. Fogrety, F.R.I.B.A., is the chief engineer.

Applications of Electricity.—A course of six lectures is about to be given at the Institution of Civil Engineers on the evenings of Thursday, February 15, March 1 and 15, April 5 and 19, and May 3. The lecturers in order will be Mr. W. H. Preece, Sir Frederick Bramwell, Dr. C. William Siemens, Dr. J. Hopkinson, Professor F. A. Abel, and Sir William Thomson. These gentlemen will deal respectively, and on the dates named, with the "Progress of Telegraphy," "Telephones," "Electrical Transmission and Storage of Power," "Some Points in Electric Lighting," "Electricity as applied to Explosive Purposes," and "Electrical Unity of Measurement."

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, FEBRUARY 3, 1883.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*** Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—
"Contract Supplement to THE ARCHITECT."*

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

APPOINTMENTS VACANT.

BATLEY.—Feb. 9.—Applications are required for the post of Borough Surveyor. Mr. J. A. Deane, Town Clerk, Batley.

LINDSAY'S

IMPROVED PATENT

REVERSIBLE TREADS AND LANDINGS

FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK,
Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13, 14 & 15 SOUTH WHARF, W.

The Architect.

WISE ECLECTICISM.

PAPER read before the Architectural Association on "The Ornament of the Period," by Mr. LEWIS F. DAY, and reported at length in the last two numbers of this Journal, was followed by a short but animated discussion, which the lecturer himself closed with an observation well worthy of being in these days taken as a text:—"In his opinion the art of

the future must be a sort of *wise eclecticism*." Upon some persons, the speaker said, this remark would operate as a red rag; he might have added that the violent opposition thus indicated would have been much more violent a few years ago; indeed now that Mr. STREET's powerful personal influence is no longer exerted, we should perhaps be right in suggesting that no advocate of hyper-individuality remains whose opinion would be recognised by the new eclectics as sufficiently weighty to command respect.

There are very few amongst the many new incidents in the world of ornamental art—itsself almost a new world in England—which more effectually illustrate the great change that has taken place in professional artistic opinion than the entirely novel signification which now attaches to the word *eclecticism*. At the time when Professor COCKERELL's Royal Academy lectures represented the latest animadversions of the higher criticism, a wise eclecticism was often especially dwelt upon by that amiable censor as the one great necessity in the art he represented. But what he meant was this. Academical classic design was primary orthodoxy. PUGIN, the Cambridge Camden Society, and a small number of other adventurous authorities, carrying a maximum of the sail of heterodoxy with a minimum of the ballast of common sense, were playing the part of radical reformers. In their eyes reform was the setting up of Gothic design, in a form that was practically sentimental, patriotic, and forcible-feeble, as a rival of the orthodox Classic. They were a good deal laughed at; they were the aesthetes of the day. But, unlike the aesthetes of our own time, who are meek and mild, they were violent and injurious, not to say uncivil and abusive. The peculiarly mellow learning, therefore, of such a man as Professor COCKERELL, speaking year after year as the acknowledged head of his profession, could discern impartiality, which he thought it his official duty to cultivate and to advocate, only in a polite recognition of the heterodoxy which was becoming fashionable, by declaring for eclecticism—"catholicity" he called it—as a virtue which orthodox artists as high-minded as himself might condescend to practise, in order that they might recommend it for reciprocation to their somewhat ungovernable opponents. Another eminent critic of the time—forty years ago—namely, Professor DONALDSON, still amongst us as an honoured veteran, used to put the same eclectic principle in a somewhat different and more popular way. As a teacher of architecture from the chair, not of the Royal Academy, but of University College; accustomed, therefore, to lead an annual class of professional pupils steadily through the whole history of the art, from the architects of SEMIRAMIS and SESOSTRIS to Sir JOHN SOANE and Sir ROBERT SMIRKE; the view which he naturally took of the matter was still broader and more liberal. All historical manifestations whatever were to be equally regarded as sacred, consecrated by the mere fact of their being historically recognisable; and the range of eclectic faith was to include the whole canon, admitting that there must be degrees of merit amongst so many various manifestations, but admitting it only vaguely, indeed reluctantly and by way of abstract reasoning, as a mere correction of that uninquiring confidence which otherwise might defeat its own object. So much for eclecticism architectural; as regards that of the multifarious arts subsidiary and supplementary in which architects are now so much interested, it is perhaps best to say that it was left to such writers as FELIX SUMMERLY, who had not yet begun to dream of South Kensington, or even of the Exhibition of 1851. In other words, the "wise eclecticism" of forty years ago,

directly it let go its hold upon academical architecture, and indeed before it had quite swung clear, found itself stranded in Wardour Street; and, of all streets in the world, the higher criticism of that day most entirely disdained Wardour Street.

The position in which we find ourselves now is obviously very different from all this. A whole profession of "designers and ornamentalists" has arisen, composed largely of architecturally-educated experts, and otherwise of ladies and gentlemen professing in almost every instance with fervour the subtle qualities which go to the making of those whose boast after all is that they are born, not made. The function of this profession is the supply of elegance and grace for the commonest uses. With them nothing is too humble to be a thing of beauty; nothing too cheap to be a joy for ever. Their Academy of Arts is the South Kensington Museum; their art-history is the history of chairs and tables, bronzes, enamels, jewels, all things fictile and textile, curios of every clime, and relics of every age; their cultus is the worship of all that is odd and quaint, and, let us say, provocative of amusement which has no laughter or scorn. It is amongst these happily-constituted folk, then, that Mr. DAY expects to see recognised, as an accepted *credo*, "wise eclecticism."

We have alluded to the influence of the late Mr. STREET as an adherent of individuality in contrast with such eclecticism; and indeed there are two species of individuality, both of which he may be well said to have represented powerfully—namely, the individuality or supremacy of the mode, and the individuality or separatism of the man. It was remarked that when he succeeded to the professorship of the Royal Academy he began to speak approvingly of Greek work—authentic Greek, of course. This was done pretty much in the same way in which his predecessor, Professor COCKERELL, as we have stated, permitted himself to patronise Gothic; it was eclectically. In both cases the feeling of official responsibility was strong enough to conquer a personal preference which was in itself nevertheless as decided as ever; and we could no more have expected to see the one designing an Ionic portico than to discover that the other had left behind him a project for rebuilding Buckingham Palace in the style of the thirteenth century. But there was this difference between the men, that the eclecticism of Professor COCKERELL was an act of politeness, whereas that of Professor STREET—who never did anything out of mere politeness—was dictated by the discovery, altogether too late to be of any service to himself, that vehemence of private prejudice could not safely be carried beyond a certain point in public teaching. For it cannot be denied that the respected architect of the Law Courts cherished a personal preference for thirteenth-century Gothic which was of the character of a faith that could remove mountains. Neither would it be worth anyone's while to disguise the fact that this was conjoined, in his case, with a confidence in his own individual power to handle thirteenth-century Gothic in his own way, which was invincible.

The new eclecticism of the ornamentalists, if we rightly understand it, would entirely set aside this individuality of the mode, or divine right of the style historical, which Mr. STREET in his heart attached to the thirteenth-century Gothic, just as his eminent predecessor accorded it to the Periclean Greek; but we may undertake to say that it is not intended to check, but rather to encourage, that other individuality of the style personal, which in the artist of high merit is a charm so invaluable. It has been said of the late Sir DIGBY WYATT, for instance, that he was so accomplished an eclectic as to be able to sit down at any moment and proceed to the design of any object of art that might be called for with equal facility in any style that might be dictated. Not only did he in this way ignore the supremacy of the style of his own academical preference—which happened to be the Italian Renaissance—but he could exclude the element of his own artistic individuality. The "wise eclecticism" of the new school has no such purpose at all. It would collect all collectable examples as stock-in-trade. It would systematise them and analyse them in order to utilise them; rejecting probably nothing as utterly bad, and accepting nothing as so utterly good that to modify and adapt it to circumstances must mean that it is desecrated and dishonoured. Nay, more, we apprehend that a judicious admixture of these crude materials is to be held admissible, and indeed commendable, in the interest of that modest originality which is the best practical form of the virtue of novelty. In architecture proper it may perhaps be true that too facile combination of diverse elements would speedily lead

to confusion; but in ornamental art it need not be so. If academicalism is destined to give way, it is easy to understand that it will first be in the art of more common and popular things, and that it will only be after a long course of experimental advance that the reform can reach the high level of *Ars Regina*. A "wise eclecticism," therefore, in the ornamental arts generally is what we think most prudent advisers will be fully prepared to encourage, and many promising artists to try.

THE HES DE LA SALLE BEQUEST.

TWO new Salles have just been opened at the Louvre for the reception of the Hes de la Salle Bequest of three hundred drawings, ranging in date from the latter half of the fifteenth century to modern times. The new Salles are *en suite* with the fifteen devoted to the drawings of masters of all schools and countries from the days of MEMLING, ALBERT DURER, the BELLINIS, JEAN COUSIN, and FR. CLOUET to the present day. The Hes de la Salle Bequest is placed in two Salles beyond the now dismantled pastel gallery. The walls of the galleries are painted a pale Pompeian red. The drawings are uniformly mounted on bluish-grey paper, irrespective of the varied tones in which they are executed. M. DE TAUZIA, Conservateur, de Dessins at the Louvre, has rendered important service to art students by the work he has published on the drawings under the modest title of a "Catalogue" replete with erudition, in the most concise and lucid form. To his learning and research are due the correction of manifold errors in the attribution of drawings of the early masters. He cites specially the confusion which has arisen in the designation of one of the finest of the Hes de la Salle collection, the *Massacre of the Innocents*; hitherto classed as the work of MATTEO DE GIOVANNI, whereas it distinctly was executed by ERCOLE ROBERTI GRANDI, the artist who painted the frescoes in the Garganelli chapel, so much admired by MICHAEL ANGELO; as also the predella now at Dresden, and the one in the Vatican representing the miracles of St. HYACINTHE.

ERCOLE ROBERTI GRANDI must not be confounded with his contemporary and fellow-student at FRANCESCO CASSA's bottega, who, in 1492 to 1499, was employed by the Dukes of FERRARA, and of whom Sir HENRY LAVARD possesses a *Madonna*, seated between St. DOMINIC and a saint. To him Messrs. CROWE & CAVALCASELLE attribute the *Saint Dominic* in the National Gallery, exhibited in the work of MARC ZOPPO. By AMBROGIO LORENZETTI there is a powerful drawing of a *Saint Dominic*—the saint, as usual, holds a model of a church—and also some studies for an *Annunciation* erroneously attributed to GIOTTO, whose name is written at the back of the paper, in the same writing as on the back of another drawn by LORENZETTI, in the possession of M. GALICHON; the error in both cases was detected by M. DE TAUZIA during his recent visit to Sienna, where, on studying the *Allegory of Peace* by LORENZETTI on the walls of the palace, he recognised the figures in fresco as identical with those of the Hes de la Salle's drawing. There are two pen-and-ink drawings by JACOPO BELLINI—one for a cenotaph, the other of a *Flagellation*. A reproduction of the latter is in the British Museum. The figures are in JACOPO's manner after he separated from the two MURANOS, and abjured the archaism of their style. They may be said to belong to the school of MANTEGNA, without, however, its savagery.

VITTORE PISANO, the great medallist, is represented by three very beautiful drawings: *The Baptism of Christ*, on the back of which is a *Pietà*; two figures of monks, having the profile of FAUSTINA on the reverse; and a design for the medal of FRANCESCO DI GONZAGA, on the back of which are several sketches. The Master's splendid draughtsmanship, a peculiar spiritualism of expression, as well as his vigorous execution are well exemplified in each of these three drawings. M. DE TAUZIA agrees with Messrs. CROWE & CAVALCASELLE in recognising in PISANO an imitator of LORENZO MONACO and GENTIL DA FABRIANO in the lithe and supple type of his figures, as also in the arrangement of his draperies. Alluding to the discovery of the frescoes in the dome of the Torriani chapel of the old Basilica of St. Eustorgio at Milan, he recalls that, in the year 1868 a thick coating of whitewash was carefully removed, revealing these frescoes, which M. DE TAUZIA not only identifies as the work of the Veronese School but of PISANO himself, proved by the identification of two of the figures, one that of

the winged bull of St. Mark in the Villardi Collection, the other that of St. Catherine of Sienna in the Hes de la Salle Gallery. The portrait of *Lionel d'Este*, formerly in the possession of Mr. A. BARKER, of London, by VITTORE PISANO, is now one of the gems of the Senator MORELLI's gallery at Bergamo. A small pen-and-ink copy of FRA ANGELICO's *Crucifixion* in the convent of St. Mark, Florence, M. DE TAUZIA mentions as a curious proof of the veneration in which PISANO held the gentle Dominican. As undoubted works of the master of the Veronese School, M. DE TAUZIA cites the *Saint George* in the Pellegrini chapel at Santa Anastasia, the *Annunciation* at San Fermo, both now at Verona, and the *Vision of Saint Anthony* and *Saint George* of our National Gallery, as also the *Madonna* seated between two angels in the Kensington Museum. That PISANO's works are confounded with those of his pupil STEFANO DA ZEVIO there can be no doubt. The *Combat de Deux Guerriers*, with the Virgin and two saints on the obverse, attributed to PISANO, in the Hes de la Salle collection is, however, the work of ZEVIO. He successfully imitated the somewhat attenuated figures and the long straight folds of PISANO's drapery. In STEFANO's foregrounds may always be remarked a number of birds and flowers, among which there invariably is a peacock. Many of the drawings in Villardi's collection may also be safely attributed to STEFANO.

The Paduan school is represented by a *Bacchanale* attributed to SQUARCIONE, of whom few drawings are extant, by a sketch by MANTEGNA of the statue of VIRGIL (engraved by GAMBEREL in 1866), and also by *La Paix*, a standing figure holding a caduceus in her right hand and a cornucopia in her left.

The Florentine school of the fifteenth and the early part of the sixteenth century, with its fresh loveliness and its sense of plastic beauty, is well represented. We have a *Vocation des Apôtres* by FRA ANGELICO, probably executed for the chapel of EUGENE IV., but not to be found either in the thirty-five drawings of the life of CHRIST in the Academy at Florence, or in any other known collection. By LUCA SIGNORELLI there is a *Saint Onesiphorus*, a sketch of the figure in a picture by that master in the cathedral at Perugia (1481). Nine most curious and interesting pages survive out of a sketch-book which belonged to ANDREA DEL VEROCCHIO, in which he jotted down the ideas which passed through his mind bearing on work in hand, as well as his household expenses, the names of his students, the days of their attendance at his studio, &c. The Duc d'AUMALE and M. REISET bought some of these pages at the Duroveray Sale. M. Hes de la Salle divided those he secured, between the Louvre, the Museum of Dijon, and the Ecole des Beaux-Arts. Mr. WOODBURN became the proprietor of others. M. DE CHEMIEVIERE, remarking on these curious leaves, states that the studies prove he almost equalled his pupil DA VINCI. M. DE CHEMIEVIERE dwells on the immense influence VEROCCHIO must have had on LEONARDO, as demonstrated by the surprising similitude there exists in their technique, as also in the character of their composition. VEROCCHIO's drawings are all the more interesting as they are sketches for well-known works, as, for example, for *L'Enfant du Dauphin*, which surmounts the fountain of the Court in Palazzo Vecchio; for the *Virgin and Child* of the bas-relief in the Bargello; for the *David* in bronze, also in the Bargello; and for the *Enfant* of the bronze belonging to the Louvre. By MANTEGNA are six sketches on a sheet of rough paper. In the centre is a marvellous CHRIST, leaning against a wall, the hands bound, and the figure resting on the right foot; a sketch on a larger scale of this foot; an architectural design for a niche, in which is a man in armour; a drawing for a similar niche, the figure being that of a saint; and also two outlines of architectural subjects, fill the paper. By VEROCCHIO the drawing for a *David* in bronze is an outline of a nude figure, behind which is a fine drawing of an infant CHRIST, holding drapery. The child's figure is full of life—"Il marche," as remarked CANOVA of the equestrian statue of MARCUS AURELIUS at the Vatican.

Of VEROCCHIO's pupil, the glorious LEONARDO DA VINCI, there is but a small drawing of the Virgin seated on the knees of her mother, and holding the Infant in her arms, who turns towards Saint ANNE. The drawing was done in *ierre noire*, and then retouched with a firm hand in pen-and-ink. It is the original sketch for the *Sainte Anne* in the square room of the Louvre. M. DE TAUZIA in his catalogue calls attention to the two studies for a *Madonna* in the British Museum, undoubtedly by DA VINCI, also ex-

ecuted by a broad pen, as bearing a close affinity to the Hes de la Salle drawing, and especially points out that the hair on the child's forehead is treated in all three drawings in identically the same manner. By another of VEROCCHIO's pupils, LORENZO DI CREDI, who is said to have been so fastidious and careful that he forbade any movement in his studio lest it should raise dust, we have *John the Baptist*, three-quarter length. The saint holds drapery in one hand. The exquisite delicacy of this drawing would alone repay study. The figure is in chalk; the lights on the drapery touched in white; the right arm is entirely unfinished. So delicate is the handling, it is impossible to discern the touches of the crayon. The whole has been covered by a wash of light red. This has also been the case as regards LORENZO DI CREDI's *Virgin and Child*, done in *molle sanguine*. BOTTICELLI's *Portrait de Jeune Femme* is marvellous in loveliness. With downcast eyes the young girl smiles with a serious and almost sad expression. Her veil terminating in pointed ends does not conceal her hair. She is of the same cast of feature as the angels in the *Coronation of the Virgin*, recently purchased at the Hamilton sale for the National Gallery. It is executed in pale red crayon. One of the most precious drawings in the collection is BENOZZO GOZZO's *Trois Vifs et Trois Morts*. He worked at the Campo Santo of Pisa from 1469 to 1485, and this drawing is considered to be among his latest works. There is also a fly-leaf of FILIPPINO LIPPI's day-book, in which he sketched the first idea of his pictures. In this instance it was the portrait of a Florentine. By FRANZIA are several figures of exquisite grace, designed for the *Annunziata* of Bologna, bearing the date 1588. In his note on one of FRA BARTOLOMEO's drawings, M. DE TAUZIA in his catalogue rectifies errors in the original designation of six sketches attributed to the Dominican. *Le Portement de Croix*, copied from MARTIN SCHONGAUER, as well as two saints on the same paper, also copied from the German master, M. DE TAUZIA admits to be the work of the father; but asserts that the *Presentation au Temple* and the *Magdalen before the Saviour* are by his pupil and associate, MARIOTTO ALBERTINELLI. One of the reasons given for this "rectification" is that the *Presentation* bears the date 1503, at which epoch he states that BACCIO DELLA PORTA no longer painted. He was, however, a *frate predicante* in 1500, at which date he took the name of FRA BARTOLOMEO, and recommenced painting at the earnest solicitation of the monks of his order; and it was in 1509 that for the second time he and that wild genius MARIOTTO agreed to paint together. The agreement was not broken till they separated in January, 1512, when the friar went to Rome, leaving there a picture which his friend RAPHAEL finished.

By RAPHAEL there is a powerful pen-and-ink drawing of a child, in which one recognises the infant St. JOHN at the knees of the Virgin, in the *Belle Jardinière*. The Virgin's face is indicated rather than drawn, it has less beauty than in the picture. Another drawing shows a bishop giving the Benediction. There is an *Eve* by CORREGGIO, a study for one of the figures of the cupola in the duomo of Parma, and a sketch of the *Mariage Mystique*, belonging to G. AUFRÈRE, Chelsea, of which a facsimile, engraved by RYLAND in 1764, is in the work of ROGERS. A drawing by PARMEGIANO is of a door having panels decorated with mythological figures of singular grace. There is also the design for a ceiling by PRIMATICCIO, the favourite of FRANCIS I., probably intended for Fontainebleau. NEPTUNE with his trident is seated in his car, to which sea-horses are attached. In the upper heavens PHÆBUS appears drawn by fiery steeds. A frieze by MURATO ABBATE is composed of figures of women dancing. A radiant chorus of angels in clouds, a tree in the foreground, and landscape in the distance, by TITIAN; a lovely *jeune femme marchant*, veiled in transparent drapery; a GUIDO; a TINTORETTO; and a CARPACCIO are among the remaining illustrations of the great masters of the early Italian school.

French art can be scarcely represented in the gallery inasmuch as, save in the instance of WATTEAU, eighteenth-century artists are omitted. The *siècle du joli* had no attraction for the classic taste of M. HES DE LA SALLE. He began his life as *garde du corps* of LOUIS XVIII., consequently in his early days military subjects interested him. There are three inimitable drawings by CHARLET of soldiers even more characteristic than HORACE VERNET's. By DE RUFFET, more epic perhaps, but scarcely as distinct in type, there is a carabineer of the First Empire. Several drawings by GERICAULT prove that artist's power of delineating horses. A clever work is a *A Man Struggling with a Bull*. Beneath it is a frieze composed of Roman

shepherds, mounted on horses, driving bulls across the *campagna*. The date, 1817, proves these to have been executed previous to GERICAULT's visit to England, when he drew various types of English horses now in this collection. There is a superb tiger by DELACROIX in water-colours; a sunset on the Seine in DECAMP's oriental manner; four pencil sketches of Cairo, by MARILHAT, and three GAVARNIS, of which two are comic scenes of Scotch life. One of these is called *Le Mauvais Quart d'Heure*, a title scarcely explained by a hideous vagabond, whose shock of unkempt air, ragged smock, and knotted stick denotes a tramp. He is shuffling along a muddy road. Two soldiers, by PILS, complete the drawings of modern days.

By WATTEAU there are two sketches. One is the charming study of a woman in various attitudes, evidently the first idea of one of his pictures. She is seated, her right arm resting on a circular cushion; she looks over the cushion to the ground. Her figure was thus thrown into a position he failed to catch, for there are on the same sheet two slightly altered sketches of the same subject. There is also an admirable copy of figures in RUBENS's *Kermesse*, drawn while WATTEAU was residing with CLAUDE AUDRAN, concierge of the Palace of the Luxembourg, where the pictures by RUBENS, now in the Louvre (originally painted by order of MARIE DE MEDICIS for the Luxembourg), then were. There is the first sketch for *La Nourrie* in the Denon Collection; the subject is treated in the somewhat coarse style of WATTEAU's early days. An interior by OUDRY and two excellent ROBERT HUBERTS alone represent the seventeenth century. *En revanche* are some splendid examples of POUSSIN, all of which are the original sketches for pictures now in the Louvre. M. REISET, the late Conservateur, and M. HES DE LA SALLE were rival collectors of POUSSIN's drawings. The whole of M. REISET's portfolio is now in the possession of the Duc d'AUMALE. Six of the designs for the Seven Sacraments already belonged to the Louvre; to these the HES DE LA SALLE bequest has added the original drawings for *La Peste*, the *Passage of the Red Sea*, and the *Crucifixion*. The drawing for the latter is sculptural in effect. The features are painfully expressive of mental suffering. The original sketch for the *Orlando and Armide* of the Berlin Gallery is also here.

EUGÈNE DELACROIX, who was one of POUSSIN's most devoted admirers, remarks that POUSSIN began to paint at a period when mannerism had vitiated public taste. From this he boldly broke away and started on entirely fresh lines. His splendid compositions had very little influence on the works of his contemporaries. Inferior artists, hitting on some new trick, formed schools of painting and attracted hosts of followers, simply because mannerisms and false style have invariably exercised their baleful influence at periods succeeding great epochs in the history of true art. POUSSIN appeared at the time when the men who succeeded the CARACCI were in vogue. He was isolated in their midst. It would almost seem that the mannerism and pedantry of these painters of the decadence extended beyond POUSSIN's period, for we can trace in LEBRUN, although a student of POUSSIN, the academic stiffness which pervades a whole generation of their successors, POUSSIN not only shook off the yoke of the CARACCI, but also that of GUIDO, and went straight back to the antique, making Rome his home in order to free himself from the cabals of his rivals. He did not imitate the statues and bas-reliefs with which he was surrounded in a material sense; he studied the spirit of the antique, not by a servile imitation of drapery, but in the manner of treating the human form and in the rendering of the human passion, of which that form was meant to be the expression, "whereas," writes DELACROIX, "the student of the present day simply copies minute details without acquiring the spirit which inspired antique art." Three sketches for POUSSIN's great work, *Moïse sauvé des eaux*, show the progress of his conception of the original idea. Writing of his manner of working, POUSSIN says: "A painter begins by the arrangement of his subject; he proceeds to the decoration, the beauty, the grace, the costume, *la vraisemblance et le jugement*." These two last, adds the master, cannot be taught; they are like the golden branch which VIRGIL tells us no man could either discover or pluck unless guided by destiny. Be it remarked that the technique only follows after the difficulty of composition has been vanquished. The execution is secondary to the dominant idea of the subject. RAPHAEL MENGES accused POUSSIN of frittering away his time on preliminary sketches, to which reproach DELACROIX replied that his slightest sketch is invaluable, for every stroke of his pencil expresses a complete

thought. Among the drawings by **POUSSIN** are two landscapes, inspired probably by the magnificent gardens of the villas around Rome, in which remains of architecture and grand old trees formed attractive subjects. The figures in **POUSSIN**'s landscapes invariably harmonise with and belong to the period of the architecture in the picture. They are never the meaningless studio models which fill the foregrounds of the works of his contemporaries. To the last hour of his life his clear perception of true art remained undimmed. "I may say with **THEMISTOCLES**," **POUSSIN** remarked, a short time before his death, "a man leaves the world just when he has learnt how to attain perfection." The Louvre purchased in 1869 the sketch of his last picture, sent in an unfinished condition to Cardinal **MASSIMO**, *Apollon amoureux de Daphné*. The trembling of the old man's hand is evident in the drawing; but the invincible force of expression and the grandeur of composition and of outline are as remarkable in it as in any of his works. Of **CLAUD LORRAINE** there is but a sketch of a landscape; of **SEBASTIEN BOURDON**, an interesting drawing of Queen **CHRISTINA** of Sweden; and of **CALLOT**, a charming outline of *L'Attaque*.

The English school is almost unrepresented. We have only an exquisite study of the mother of **M. HES DE LA SALLE** by **COSWAY** and two drawings by **BONNINGTON**. It would be difficult to exaggerate the delicacy of **COSWAY**'s drawing. Although only in pencil, slightly touched, it expresses the character of the lady as thoroughly as the most finished miniature **PETITOT** ever painted. **M. HES DE LA SALLE**, when giving away to the Louvre, to les Beaux-Arts, and to Dijon the priceless art treasures he had devoted his life and fortune to acquire, alone reserved this portrait of his mother, which, he said, with tears in his eyes, he would retain to his last hour.

PARIS NOTES.

THE Prefect of the Seine has just named an administrative commission to report upon the best means of providing dwellings suited to the requirements and resources of the humbler classes of the people, from the prosperous artisan down to the navy or *chiffonnier*. The committee, which is presided over by the Prefect, consists of Messrs. **Vergniaud**, Secretary of the Prefecture; **Alphand**, Director of City Works; **Dietz-Monnin**, senator; **Thulié**, municipal councillor, vice-presidents; the mayor of the 8th arrondissement; Messrs. **Couche**, **Bartet**, and **Cheyson**, Government engineers; **Trélat** and **Bouvard**, City architects; **Mulher**, civil engineer; **Reinach**, and twelve members of the Municipal Council. From the influential character of the commission it is evident that business is seriously meant, for although routine is too powerful in France, the report of a strong committee is rarely treated with neglect and pigeon-holed for future reference at unknown date, as so often happens in England.

The epidemic of typhoid fever, from which Paris suffered so severely last year, has had the good effect of waking up the standing committee entrusted with the supervision of unhealthy dwellings. Great activity is now displayed in turning out the occupants of numerous badly-lighted and ventilated tenements. One of these evictions has given rise to a law-suit and an important decision. The tenant of a shop and apartment above having been prohibited by the authorities, on the ground of insufficient ventilation, from using some of the rooms hitherto occupied by his employés, turned round upon his landlord and demanded a reduction in the rent. The owner resisted, on the ground that the unhealthiness of an apartment in no way concerned the landlord. The French law, however, without particularly specifying cases declares that any serious deprivation of the advantages or enjoyments of a tenancy entails either the cancelling of the lease, or a reduction in the rent. The Court accordingly awarded a considerable reduction in the rent. This decision is of the utmost importance as creating an entirely new precedent, and will probably be followed by numerous suits of a like nature.

A committee of five has lately been appointed by the Municipal Council to collect the necessary materials for fixing the value of all land in the City of Paris, whether built over or not, and of all private buildings. The work of valuation will be carried out by experts, who will hereafter be elected by the Council, and a sum of 30,000*fr.* has been inscribed in this year's City Budget for the expenses of the Commission.

In addition to the supplementary members of the jury already

nominated by the Académie des Beaux-Arts for the Grand Prix de Rome, the following have just been named:—*Painting*, MM. **Carolus Duran**, **Tony-Robert Fleury**, **Ferrier**, and **Morot**. *Sculpture*, MM. **Coutan** and **Idrac**. *Architecture*, MM. **Coquart** and **Dutert**.

The jury for examining works sent in by French artists for exhibition at Amsterdam consists of the Minister and Under-Secretary of Public Instruction, presidents; the Director of Fine Arts, vice-president; MM. **Baudry**, **Bonnat**, **Cabanel**, **Carolus Duran**, **Cazin**, **Gérôme**, **Harpignies**, **Hébert**, **Henner**, **J. P. Laurens**, **Jules Lefebvre**, **Meissonier**, **Puvis de Chavannes**, **Vollon**, **Chaplin**, **Chapu**, **Paul Dubois**, **Falguière**, **Guillaume**, **Mercié**, **Aimé Millet**, **Boeswillswald**, and **Robert**; inspectors-general of historic monuments, **Daumet**, **Charles Garnier**, **Poulin**, **Vaudremer**, **Flameng**, **Gaillard**, **Lalanne**, **Dupont**, and **Ollendorff**.

At the Ecole des Beaux-Arts, in the competition for heads (expression) founded by the Comte de Caylus, the prize was awarded to **M. Rochegrosse**, a pupil of MM. **G. Boulanger** and **J. Lefebvre**, an honourable mention being accorded to **M. Marius Roy**, pupil of the same artists. In the medallion competition, **M. Poujol**, pupil of **M. Cabanel**, gained a second medal; while **M. Bergevin**, pupil of **M. Gérôme**, and **M. Leandre**, pupil of MM. **Bin** and **Yvon**, received third medals.

The Paris Municipal Council have determined upon the erection of an immense cattle market and abattoirs in the 15th Arrondissement, on the left bank of the Seine, where the lines of the Western Railway, serving Normandy, Brittany, &c., cross the Circular Railway that runs round the capital. The cost of the new market, including indemnities to land and house-owners and occupiers, is estimated at about 800,000*fr.*

At the sale of a collection of designs, both ancient and modern, for silks, woollen and other stuffs, &c., held lately at the Hôtel Drouot, there was a spirited competition between Mr. **Quaritch** and a representative of the Union Centrale des Arts Décoratifs. Finally, the latter proved victorious, the price offered being 10,600 francs. The collection, which consists of no less than 213,442 different designs, is extremely curious, containing, as it does, samples of material of every age and clime. It is a pity the authorities of Bradford or Manchester did not take steps to secure a prize that would have been of immense service in technical schools. If necessary, the collection could have been divided so as to suit local industries.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE sixth ordinary meeting of the Royal Institute was held on Monday evening, Mr. **E. P'Anson**, Vice-President, in the chair.

Royal Gold Medal.

The **CHAIRMAN** announced that the Council had determined to submit to her Majesty the name of Mr. **Charles Cranmer Penrose** for the Royal Gold Medal. Mr. **Penrose** was a past Vice-President of the Institute and surveyor to the fabric of St. Paul's Cathedral. He was the author of a valuable work on the principles of Athenian architecture, the result of an investigation carried on at Athens in the years 1845-6, in which the subtleties and optical refinements of the lines of the Parthenon were demonstrated with the utmost mathematical precision.

The Pugin Travelling Studentship.

The **SECRETARY** announced that the Council had awarded the Pugin Travelling Studentship to Mr. **William Alfred Pite**; the Sharpe prize, being the second award in the studentship, to Mr. **Joseph Gibbons Sankey**. The Council had also determined to give two certificates of honour, one with five guineas to Mr. **Henry Hardie Kemp**, and a certificate of honour to Mr. **Charles Aubrey Bassett-Smith**.

The **Godwin Bursary** was awarded to Mr. **Hugh McLachlan**, and the Council had accepted his undertaking to travel in North Germany.

The **SECRETARY** then stated that Professor **Armstrong** would read the paper for the author, Mr. **E. C. Robins**, F.S.A., who was unable to be present owing to indisposition. The paper was entitled—

The Special Buildings required for Applied Science and Art Instruction and for the Development of Technical Education generally.

Professor **ARMSTRONG**, who had personal knowledge of the buildings, &c., treated of in the paper, said that it was too long to read through in the time allotted for the purpose, but he hoped to give them as good an abstract of it as possible.

The author opened his paper with a brief essay on the subject of technical education, in which he gave his views on the subject, and remarked on the rapid growth of interest in scientific research, and in the provisions made all over the civilised world for applied science teaching, observing that the study of the natural sciences hitherto relegated to the "modern side" was rapidly being included in the curriculum of every liberal education; that the application of the principles of physical science to the development of mental activity as well as to industrial enterprise would in all probability be the distinguishing peculiarity of the latter half of the nineteenth century. This great revolution in the systematic education of the period, to which attention had been drawn by Professor Huxley and confirmed by Professor Matthew Arnold, pointed to a corresponding change in the design of the buildings required for its development, and thus gave the *raison d'être* for the subject under discussion. Mr. Robins said that his paper, read at the Society of Arts last May, on "English and Foreign Technical Education" was an introduction to the present one relating to buildings required for its future development. In that lecture he gave no illustrations of the buildings or their fittings; he now proposed to enter upon the examination of English and foreign examples, and to draw attention to the peculiarities of the arrangements required. The establishment by the present Government of the Royal Commission on Technical Education, and the spirit displayed by the City and Guilds of London and by the public generally, led him to think that the present was an appropriate time for specially introducing the subject to the consideration of the Royal Institute of British Architects, the services of whose members would be required to meet the coming demand for suitable buildings. As a member of the Executive Committee of the City and Guilds of London Institute for the Advancement of Technical Education, he had accompanied some well-known professors to Germany to inspect the latest examples of buildings devoted to the teaching of science, and he proposed to give the result of his studies in so far as the limited time and space at the disposal of the Institute would permit. To this end Mr. Robins divided his paper into two general divisions, viz.—First, the particular accommodation required for some of the leading subjects and the systematic general arrangement of the plan. Secondly, the various fittings and apparatus applicable to the distinct uses of each. No such attempt having as yet been made, he hoped to make the matter clear by fulness of illustration. He proceeded to observe that of course all technical education did not require special accommodation; the ordinary class-rooms attached to school buildings might be appropriated to certain kinds of technical or applied science instruction, provided they were efficiently lighted and ventilated. But there were many subjects which must be taught in specially designed buildings, for example, chemistry and physics, biology and physiology, botany and forestry, mechanics and engineering, anatomy, architecture, and the fine arts generally, involving the provision of laboratories, lecture and work-rooms, drawing and modelling-rooms, &c., &c., separately grouped together in a certain order and contiguity, specially floored, drained, lighted, heated, ventilated, and arranged for particular furniture, fittings, and apparatus, not to speak of the specific trade schools for teaching weaving, dyeing, &c., &c.

The author referred to the remarkable impetus observable abroad towards the construction of such building and reviewed the general principles underlying their admirable planning, noting also their defects, and deduced some general rules for the guidance of future designers. He then proceeded to describe several foreign buildings, illustrations of which were exhibited, namely:—1. Bonn and Berlin Chemical Laboratories; 2. Munich ditto; 3. Aachen ditto; 4. Graz ditto; 5. Physiological Laboratory at Berlin; 6. Physical and Chemical ditto, Chemnitz; 7. Physical Laboratory at Würzburg; 8. Technical High School, Hanover; 9. Fine Art and Building School, Charlottenburg; 10. The Great University at Strassburg; 11. Technical College, Japan; 12. Royal Technical High School, Stockholm; 13. Technological School, Gottenburg; 14. Chemical Laboratory, Pest. Of the English buildings described by Mr. Robins were the following:—1. The Central Institution of the City and Guilds of London Technical Institute, South Kensington; 2. The Finsbury Technical College; 3. University College, London; 4. Roscoe's Chemical Laboratories, Owens College, Manchester; 5. The Manchester Grammar School Chemical Laboratories; 6. Josiah Mason Science College, Birmingham; 7. The Yorkshire Applied Science College, Leeds; 8. The Bristol Trade and Mining School of the Society of Merchant Venturers.

Professor Armstrong gave in considerable detail the remarks of the author on the arrangement and construction of laboratories and it was noticed that abroad the advanced students were generally separated from the beginners, but in England this was not usual. The author concluded with a description of the fittings and with the general and special systems of heating and ventilating required for such buildings, illustrated by above a hundred drawings.

Professor Armstrong then made use of these illustrations while he gave a rapid sketch of the author's remarks more particularly on the question of heating and ventilation. The laboratories at Bonn and Berlin were the earliest constructed, having been erected

in 1863. No special system of ventilation had been provided at these. Their arrangement involved a waste of space and of the students' time in going from one part to another. So unsuccessful had they proved that warning had been taken, and the mistake was not repeated. The Munich laboratory was far more compact, and that at Graz was one of the best laboratories to be found anywhere. By the system of ventilation at Munich and Geneva, two pulls of air were put into competition with each other, and proved unsuccessful. In this system, by openings in a central shaft, air was pulled in by a fan at the base of the shaft. In every room there was a large steam chest through which the air had to pass before it entered the room, and draught-closets were built in the windows. Stoneware tubes were carried up the wall till they reached a large flue near the roof. All these flues converged till they were brought into the central shaft. Here there were two fans in action, one pulling in the air, and the other drawing the air from the draught-closets. These two had been found to work so much against each other that ventilation of the rooms had been practically abandoned, the air inlets from the outside had been stopped up, and the air used came only from the shaft.

The system at Aachen was more successful. There was a central heating-chamber filled with steam coils. The air was forced through this chamber, and sent through different flues into the various rooms, cool air in summer, and warm air in winter. An elaborate system had been arranged at Aachen by which the engineer could tell at any time the exact temperature of any room. A thermometer was placed in each room, and as soon as the temperature of the room got too high, or too low, a bell rang, and by an ingenious arrangement the engineer could let down a thermometer, learn the exact temperature of the room, and alter it accordingly. There was also an hygrometric arrangement, which enabled him to test the air, &c. There were in all three fans, two of which were placed at the bases of the extracting shafts. The ventilation here appeared exceedingly satisfactory. At Graz was a system similar to that adopted in London. Air was drawn in by a large fan, and forced into the rooms. Several heating chests were distributed in the building instead of a central heating-chamber, and the air was driven through the heating-boxes into the rooms, and found its way out again through flues built in the walls. At Graz there was simply a push of air; at Aachen the air was both pushed and pulled. At Finsbury College the heating arrangements were similar to those at Aachen, though simpler. There was a central shaft with a heating-chamber to the left; the air being carried through flues to the rooms, corresponding outlet flues being provided for the air to find its way out again. At the Central Institution, South Kensington, air was forced by a fan through heating-boxes placed at the bases of the corridors, and carried into the rooms by flues. At the Bristol school a fan and heating-boxes were provided. The air was drawn into the building through openings and was afterwards sucked down again through flues in the wall, and carried out through the basement. At the Calver Street school, in addition to the ventilating chamber there was a shaft intended for general ventilation of the building which, besides carrying off gases from boilers, waste flue gases, &c., was used to produce ventilation in the chemical laboratory, warm or cool air being forced in from openings along one of the walls. No special exits were provided, but there was an elaborate system of flues over the whole of the floors in communication with a downcast shaft. The air was drawn off very evenly, reaching ultimately the downcast shaft, whence it was delivered into the upcast shaft, an imitation somewhat of the system at Aachen, though here the pull was by means of the shaft.

The CHAIRMAN said it had been somewhat difficult to follow the description of the elaborate buildings treated of without a study of the illustrations which accompanied the paper. The lecture divided itself mainly into two sections. One described the buildings erected during the last half century in England and on the Continent for the formation of science schools, the result being apparently that the best models were to be found at Aachen and Graz. The other treated of an old difficulty, the question of ventilation. The principles adopted, he gathered, were much the same as the system applied by Mr. Phipson to the Albert Hall, of driving air by steam power into the building with powerful fans and the employment of large central flues.

Sir FREDERICK BRAMWELL, C.E., observed that the great problem in regard to ventilation was to introduce sufficient air into a room or building without inconveniencing the occupants. If the air impinged at a rate greater than a foot and a half a second, those sitting near the orifices where it entered experienced a sensation of cold. The velocity could be kept down by an arrangement of double walls, but it necessitated a considerable sacrifice of space. Mr. Phipson had in this way dealt with the meeting-room of the Institution of Civil Engineers. The air forced in amounted to 1,000 cubic feet per hour for every person present. The result was perfectly satisfactory, but it had been done by sacrificing the size of the room. If persons were prepared to bear the expense, and with the deprivation of room, it could be arranged, but not otherwise. It was generally found that people who had to sit near air inlets, if they had the chance, were in the habit of stopping them up, and the real problem was to introduce a sufficiency of air without making it perceptible. It seemed rather a work of

supererogation to provide a fan for purposes of extraction, where there was already one to force air in. At the meeting-room of the Institution the air was left to find its own way out.

Dr. SIEMENS said he had come to learn rather than to express his views on the subject of architecture. The array of plans hung round the room must have struck everyone as being most complete and most instructive, showing as they did the gradual improvement which had been made in laboratories for the purposes of chemical researches. In listening to the paper, one thing struck him as not sufficiently borne in mind in the arrangement of these buildings for different towns, and this was the character of the students to be taught. At Berlin and other university towns the beginners were eighteen years of age, or thereabouts. They had already passed through an elaborate system of training and education, and intended to be chemists. It was necessary to provide, not only for elementary instruction, which should never be neglected, but also for higher branches of research in which the student must pass three or four years. The requirements for so exhaustive a course of tuition were very different to where elementary tuition only was required. The arrangements of plan and design in some of the polytechnic schools however were to his taste far too elaborate. Students were put into a palace they were not fit to inhabit; the result had not been entirely successful, for the polytechnic schools in Germany and Switzerland had gradually lost ground, and the number of students had gradually diminished. No one who wanted a complete scientific education went to them, the doors of the University being open to them for every branch of science, but at the polytechnic school the education was limited to a certain branch of science, to fit the student for a certain trade. Some of these schools seemed gradually assuming the character of technical universities, and it was a question whether they would not eventually grow into universities with all the advantages such institutions offered. Whether it would succeed he was not prepared to say, but his opinion was that if science of the higher kind was taught, it should be planted at the university. As regarded England he thoroughly approved of the plan followed at Finsbury, of throwing the beginners and the more advanced students together in one room and under the eye of one professor. It would be idle to shut young men, who had not yet imbibed a love for science like older ones, up in a room where they could "lark" together, instead of being under supervision. He doubted whether the accommodation for this class of students was not too complete. A laboratory where the elements of science could be taught was certainly necessary. Technical schools should not be allowed to degenerate into teaching trades to young students, a point in which the early schools had erred, by attempting to turn out people completely instructed in the art and mystery of their craft. Dr. Siemens then observed that the very complete system adopted at the Finsbury College, of sucking up the poisonous vapours of the laboratory into a sink the moment they were created, was most admirable. On the question of ventilation, Dr. Siemens agreed with Sir F. Bramwell as to the disagreeableness of draughts of air from the air inlets. The difficulty would have to be met in some way. He would like the system of heating by radiation to be introduced, if it could be combined with the admission of air—not, however, from parts of the room in a direct line of contact with the occupants; then they need not care about exits, except, as at Finsbury, for purpose of separation, and withdrawing foul air before it could mix with the air of the room.

Mr. MAGNUS said he thought it was important that the question of the architecture of technical schools should be brought before the notice of the public. The time was, not so long ago either, when it was thought sufficient for all educational purposes if a certain number of class-rooms and lecture-rooms were built. But of late years a great change had come over systems of education for industrial purposes, not only on the Continent but in England, and it was found that there was far more connection between the structure and plan of the building in which education was to be given, than was previously thought to be the case. He had lately gone by invitation to one of the important manufacturing centres of the country, and had found a large college erected by the munificence of a single individual, and he was asked how technical instruction in various branches, in electricity, &c., could be introduced, and he found the building was so ill-adapted for the purpose, that it was almost impossible to say under existing circumstances and arrangements how such instruction could be carried on. When education consisted of little more than the study of ancient literature and history, an ordinary kind of building sufficed; but now modern inventions and natural history were substituted for ancient history, &c., it became necessary that specially designed buildings should be erected. Thus it seemed important that the kind of buildings erected on the continent should be brought under notice of the English public. He had within the last four months had an opportunity of inspecting most of the buildings shown in the illustrations on the walls. He had observed that Dr. Siemens and Mr. Robins had both referred to the difference existing in chemical laboratories in Germany and in England, as to the arrangements made for the instruction of beginners and of advanced students. Mr. Robins thought there was not so much difference in advanced students in England and abroad. But the fact was, there was a vast difference at both ends. In chemistry,

in particular, the advanced students abroad were far behind beginners in England, and chemical education in Germany was far behind what it was in England. A laboratory in a German school was uncommon; but in our new schools in England chemical laboratories were common. The German student went to the polytechnic school with far less knowledge than the student did in England. But the German student did not think he could become a qualified chemist by studying two, three, or four years; he did not mind undergoing the sacrifice of time, which seemed impossible to the English student, of remaining six or seven years to pursue his studies. This desire of perfecting themselves was a distinguishing mark, and the result was that the German chemist was far beyond the English chemist. Chemists for industrial purposes could in Germany be had in hundreds, while in England they were only to be had individually. Mr. Magnus said that the plans brought under their notice by Mr. Robins referred almost exclusively to the chemical studies carried on in the German universities and polytechnics. He would have liked some plans of mechanical laboratories also to have been brought under their notice. In describing these Mr. Magnus alluded to the apparatus which gave students the opportunities of testing materials and strains, &c. The mechanical laboratory at the magnificent Munich polytechnic was most complete, and he did not know of any that would compare with it. Another important point was the attention which was now being turned to physics, little having previously been done in the way of applying physics to industrial purposes. The speaker praised the arrangements at the Finsbury College, and said that for practical physical instruction there would be no place to compare with the London Central Institute when finished. In concluding, Mr. Magnus said that besides the arrangements for chemical research in the universities and polytechnics brought under their notice, there also existed on the Continent a large number of technical schools for which special architectural treatment and arrangement was necessary, and these schools were of a lower grade even than the polytechnics, a sort of intermediate schools, with practical workshops fitted up in connection with them, and schools for the instruction of artisans. These and notably schools of weaving and dyeing, which formed a special branch, required a special design and plan for the school buildings. Technical schools required a great deal more study than was necessary for fitting up laboratories for polytechnics and universities.

Mr. C. BARRY proposed a vote of thanks to Mr. Robins for his paper, coupled with the name of Professor Armstrong. He observed that Mr. Robins had led them a step further in the direction in which almost every educated man's thoughts were now travelling, viz., as to how scientific and other manufactures might best be improved in this country by improving the manufacturers, not by improving machinery alone, but to aid in its application by giving the workers an intelligent insight into its use and a knowledge of their work. The principle was spreading over the country to an extent which had never been the case before. The paper, therefore, came most fittingly before them, because, as architects, they had most to do with providing the buildings for the technical student. The thought suggested itself to him that, even in the face of the elaborate plans and illustrations before them, they should be careful not to generalise too far as to this or that particular arrangement being the best. During the twenty-five years these buildings had been erected, they had almost always been described as having been built under the direction of some professor. Of course there were many experienced professors, but the differences in various buildings seemed due to the individual fancies of some professor being consulted rather than the ideas of architects. In comparing the buildings they must therefore be careful not to think that they had the whole thing. Mr. Barry, in referring to Dr. Siemens' remark on the danger of doing the thing too elaborately, of erecting too costly buildings, &c., and being sorry for it after, remarked that Faraday with much simpler apparatus and an ordinary apartment became the Faraday we knew, and created a body of students, many of whom had become men of renown. Faraday, no doubt, would have welcomed every improvement, but at the same time they ought to be careful, as Dr. Siemens said, not to over-elaborate matters, which, instead of creating public interest, would cause it to decline. If technical education was to become popular, the question of cost must be borne in mind, and that being so, it was clear that as architects they had not to consider which should be the most perfectly arranged room, how many rooms it would be desirable to have, what would be the most perfect kind of ventilation, "to pull or to push," &c., but the least which would do to answer the purpose of the education in view. It must be felt that it was a new movement of English thought, and one which must take time to permeate the mass of the people, and that there had not yet been time for this, so that it was necessary to have considerable patience and faith to look forward to the results desired, in the forming skilled teachers, trained artisans, and more perfect buildings for the supply of technical education.

Professor PERRY said he thought a great deal of the elaboration seen in the plans around the room was due to the great size of the buildings that had to be dealt with. In small laboratories, for instance, much simpler systems of ventilation would be pos-

sible. He hoped Mr. Robins would on a future occasion take up the subject of small laboratories, which would have to be scattered all over England in the next few years if technical education was to come to anything.

Mr. C. F. HAYWARD remarked that science schools were institutions of a very recent date, and only within the last few years had they been established at Harrow, Eton, Rugby, &c. That at Harrow was the result of the best knowledge in London. Professor Tyndall, on returning from America, had remarked on the absurdly small size of the building, which was actually double the size of what the authorities originally intended. He was sorry to say, however, it had proved quite large enough. The provision of a school need not be costly. Let a room be got for a laboratory and another for lectures in close proximity. Smaller rooms might be had as required, and additions might be made to any extent. This was all that was really needed.

The CHAIRMAN then put the vote to the meeting.

Professor ARMSTRONG, in his reply, said that he had not of course been able in the time at his command to do justice to Mr. Robins' paper by giving all the information it contained.

A proposition made by Professor T. Roger Smith to adjourn the discussion to the next meeting was withdrawn, as the evenings till April 23 were engaged.

The meeting then terminated.

THE RUSKIN MUSEUM.

IT was proposed at a public meeting in Sheffield, which was held several months ago, that a suitable building should be provided to contain the works of art belonging to Mr. Ruskin, which are now in a house at Walkley. But the funds for the purpose were not subscribed, and it is feared that the offer may be withdrawn. On Sunday last in the parish church, Walkley, the Rev. J. J. Dyson, M.A., appealed to his congregation to support the project. After showing that art, properly applied, might be made greatly helpful from a religious point of view, he went on to say:—The dweller in black and smoky manufacturing towns finds a deeper joy in lovely scenery than the man who lives amongst it, and can see it every day of his life. It is in this respect that the inhabitants of Sheffield are so fortunate. Our town is perhaps more hideous than others of its class. It can boast of scarcely any fine streets and public buildings; and though at last grand efforts are being made to transform its narrow lanes into broad highways, lined on either side with stately piles of buildings, it must be many years ere we can say that we possess a town worthy of its position in regard to numbers, or influence, or wealth. But its surroundings are for natural beauty above and beyond all praise. It lies in a hollow ringed with the everlasting hills; within an hour's walk are silver streams and tree-clad hillsides sloping down to shady valleys and a sea of purple heather. Tired inhabitants, choked with a week's smoke and dust, can wander forth and refresh themselves with the pure air and the lively sights of a scenery perhaps second to none in this England of ours. It may be said that, where beauties are spread abroad by nature with such a liberal hand, no one can say he may not, if he chooses, take a share in the delight of them; it may be said that nothing else is needed—that having this he needs no gallery of pictures, however choice, no collection of curiosities, however priceless or however rare. And that is partly true, no doubt. Natural beauties must always be superior to beauties of art, and yet both the one kind and the other perhaps have their own especial function to fulfil and their own especial advantage to bestow. And that place is surely the most fortunate which has a chance of possessing and studying both the beauties of nature and the beauties of art, and it is surely guilty of folly and silliness if it deliberately refuses to avail itself of its opportunities. Now, such a place is Sheffield. Few persons will care to say that we have not a most lovely neighbourhood. Few persons will venture to say that we do not, in the small museum which Mr. Ruskin has established in this parish possess the germs of what might easily be made one of the finest collections in the whole country. The very fact that it bears his name is amply sufficient to prove that it contains absolutely nothing but which is first-class. And this, it should be observed, cannot by any means be said with perfect truth of all museums. But we here are or have the chance of being especially fortunate, for the man who is the first art critic in this or any other country, has placed at our disposal the result of his careful and long-continued collecting. I cannot say why he selected Sheffield as the recipient of his gift; but of one thing I am quite certain, and that is this, that he never dreamt or imagined in his most speculative mood the reception which his offer would meet with. You who hear me know well enough in what sort of a building these inestimable treasures are allowed to remain. You know that the room is so small that it is impossible for more than two or three to move about in it at the same time. You know that very many splendid objects have to be stowed away out of sight because it is impossible to find space in which to display them. This state of things renders the graceful gift worse than useless; it raises hopes which are incapable of fulfilment. It is not so much because of its position. In his choice of a home

for his treasures, Mr. Ruskin displayed all his usual skill and judgment. Its position is well enough. All that can be said against it is that it is not sufficiently central. What renders it such a failure is the absolute want of necessary room. What happens when a stranger to Sheffield, hearing of the Ruskin Museum, wishes to see it? What do you imagine he thinks of us in allowing so magnificent a collection to remain in so utterly inadequate a building? And the worst of it is that it is now years since the museum was first brought here. Nothing has been done towards remedying the defect, and nothing seems likely to be done. There have lately appeared in the papers several letters on the subject, written more in sorrow than in anger. But, practically, the matter appears dropped. Are we to conclude, then, that Sheffield in general takes no interest in the museum—does not care to have it—thinks it is not worth troubling about? Outsiders might naturally come to that opinion, and might be induced to believe that Sheffield is still the barbarous, uncivilised place which it was generally believed to be a score of years ago; that Sheffield is contented with its hideousness and dirt, and has no desire to make itself less ugly, or to gather fresh ideas of what real beauty is. But you who know Sheffield, who love her, and are jealous for her honour, know that this is not and cannot be the case, but that the real reason is that no one prominent citizen has yet found time or opportunity to stir in the matter. We have all been waiting for someone to do so, and no one has been the first. There are no doubt hundreds and hundreds of persons ready and willing to help—to do something, if they only knew what to do. The first thing to be done is for some half dozen men or so, who are men of light and leading in the town, who are known to be lovers of art and of letters, and on whose judgment and capacity in such matters full reliance can be placed—to go thoroughly into the whole thing, to find out exactly what is wanted, and how much will suffice to provide it—and then to ask the people of Sheffield to find the means for carrying out the scheme. We must not allow matters to drift on any longer. But it may be said that there are so many things which sorely need support and do not get it, that it would be folly to invite subscriptions for an entirely new thing. We need, it may be said, more churches, more schools, more funds at our hospitals; let us provide these first, and then, with what remains over and above, provide a home for a museum. There is a truth in this; we do want these things sorely; but we want just as sorely—nay, if I may venture to say so, we want still more sorely—a wider range of education for our middle and lower classes. The education which they get in schools is not enough, especially in days like these, when the sole test of education is the ability to pass examinations. We want and we must have some refining, some cultivating, some elevating influence at work, which will not only teach a man to be discontented with his present surroundings, but also inspire him to make a real manly effort to improve them. And unless I make a mistake the proper housing of the Ruskin Museum so that people can avail themselves of it freely and easily will have that effect.

ARCHÆOLOGY OF THE PETERBOROUGH DISTRICT.

DR. WALKER, of Peterborough, who has studied the archæology of the district, suggests that the English-speaking nations throughout the world should be asked to assist in the restoration of the Cathedral, as they have an hereditary interest in the building. He says:—

Although these ancient churches mark especially the grand step in our progress resulting from the establishment of Christianity, they are also closely connected with the earlier history of our nation, erected as they are on the sites which were the centres of the political and religious life which preceded them. The great fen district, on the borders of which Peterborough is situated, has been by the persevering exercise of skill and industry converted into one of the most fertile and highly-cultivated districts of England; but in its original state of marsh and morass, with extensive gravel islands, difficult of access, it was a region especially adapted for defence, and in and around Peterborough Cathedral are to be found clear traces of the life and struggles of the various races who have during the last 2,000 years inhabited Britain, and who all have left their impress on the great Anglo-Saxon peoples who constitute, in each hemisphere, the freest nations of the world.

Mounting the central tower of the Cathedral while it still remains standing, and taking my post on its summit, I can, within a circle of 1,000 yards radius, see records of each of the races who have dwelt in this island from the earliest known times. Looking over the north-west turret I see the spot where last summer I had the photograph taken of the skeleton of an adult Roman as it lay where it was placed 1,800 years ago. In the same place I have collected the bangles, the rings, the brooches worn and the money carried by the disciplined, stalwart, and brave invaders who drove the equally brave, bigger-brained, though smaller-bodied and less civilised British into the fastnesses on the borders of which these Romans here lie buried. For more per-

manent traces of their life and work here I have but to turn to the east, and, looking over the apse of the Cathedral, I see running just beyond it the Carr Dyke, which, skirting the fen from Peterborough to Lincoln, was the first great engineering work for the drainage of the fens, and which is attributed to these same Romans who lived among us for over 350 years, and whose blood still runs in Anglo-Saxon veins. Of actual Roman buildings no trace is known within the limits of the city nearer to the Cathedral than the village of Caistor, where, at a distance of four miles from Peterborough, the foundations and ruins of Durobrivæ, an important Roman town and settlement, still exist. It must not be forgotten, however, that the apse of our own and some other cathedrals is a relic of a Roman architecture which is held to indicate the construction of these great Christian temples on the plan of the Basilica. Turning again, I see the spot where: at sunrise the shadow of the south-west pinnacle, the culminating glory of our Cathedral, points to the graves where lie hundreds of those hardy, rude adventurers who followed the Romans as invaders of and settlers in this island. Here I have taken from beside the skeleton of the Saxon warrior who wielded it 1,400 years ago the spear which he had probably used against the Britons whom he had assisted to drive into the fastnesses of the fens. And here in the rough pottery, the bronze and gold-plated brooches, strings of glass beads, weapons, &c., which lie buried with their former owners, we get a glimpse into the semi-barbarous life of our pagan Saxon ancestors. Of that other more powerful and still more adventurous northern race, the Danes, who landed again and again on the eastern side of our island, traces exist in the names of the hamlets of Peterborough, the Medehamstede of the period when those Saxon bones, clothed with living flesh and animated by living souls, were the men who worshipped Wodin, where now stands the grand monument of mediæval Christianity, for whose preservation we plead. It is in tradition, in local names, and ancient manuscripts that we find the history of the early Christian Church, founded here about A.D. 650 by Peada, King of the Mercians, a church the history of which, from the nature of the locality, is a reflection of the troublous times which preceded the Norman Conquest. Twice, at least, it was burnt down by the invading Danes. According to some authorities, it was last destroyed by Sweyn, another building being erected at the beginning of the eleventh century under the auspices of the Danish King Cnute, to whose instigation is attributed another great engineering work, the raised causeway across the fens still called King's Delph, the commencement of which can be seen two miles away looking south from my position on the central tower. A few years later this Cathedral, having passed under the hands of the Norman Abbot Torold, had to be fortified to stand the attacks of Hereward and his Saxons, who, in the recesses of the fens, held their own against the Norman Conqueror after all the rest of England had succumbed. This eleventh-century building shared the fate of its predecessors, and it was after its destruction, about 1118, that the Cathedral now standing was commenced. Although, doubtless, many of the stones hewn for its predecessors are incorporated in the structure, they are not traceable, and no part of the building can be assigned to an earlier date than that given.

Into the details of the gradual additions, century after century, by which was accumulated the pile of buildings of which from this tower we have a bird's-eye view, I need not enter, each addition to the Cathedral marking by its own characteristics the age in which it was made. The strong gateway, with its ancient portcullis, the adjoining prison, the buried bridges over the moat, the ruined infirmary with its chapel and ante-chapel, the infirmary's house, the cellarer's house, the cloisters—all combine to tell the history of the successive centuries during which were concentrated in the Church the learning and the greater part of the wealth and power of the country; when the abbeys were the centres of literature and art, and not only of the architectural but of that engineering skill of which we find evidence in other great works executed for the drainage of the fens, and notably in that embankment and cutting which was carried out by Abbot Morton, of Ely, in 1480-90, and which, commencing just behind the Cathedral, runs more than twenty miles through the fens, and is still known as Morton's Leam.

Of the mighty change which swept over Britain in the sixteenth century, destroying many of these ancient churches and changing others, like Peterborough, from abbeys to cathedrals, the grave of Katharine of Arragon, in the choir below me, is a silent record, since, to the presence of her body in this abbey, it is said we owe its preservation at the dissolution of the monasteries, and its conversion into a cathedral of the Reformed Church. The stone which covers the spot where Mary Queen of Scotland lay for twenty-five years after her execution marks further the continuance of the struggle between the two great religious parties, while the ruined cloisters carry us on 100 years further to the great struggle for liberty in 1643, when this Cathedral suffered so terribly at the hands of the Parliamentary soldiers.

Of the importance of this locality in the struggles of the Romans and Saxons against the ancient Britons, we find records, as I have shown, in the skeletons of the invaders which lie buried here on the edge of the fens. Of its importance in the struggles of

Danes and Normans against the Saxons we find the records in traditional history committed to writing by those who lived shortly after the events. Of its importance in the great struggle between King and Parliament we have the record in the words of an actual combatant, Henry Cromwell, who writes to Captain Berry, July 18, 1643—"to hold Peterborough at all costs, as it is the key to the fens, which, if lost, much ill may ensue." Must we be surprised if it is in the ruins around me, in the matrices of the monuments from which the brasses have been torn, in the fragments of the wrecked choir, that we read how the Puritan soldiers, fighting for political and religious freedom, half-blinded by party zeal, probably smarting under the recent defeat of their comrades at Stamford and Croyland hard by, and possibly missing the restraining hand of that commander who could rule alike friend and foe, ruthlessly robbed the Cathedral of treasures associated in their minds only with false religion and political tyranny, and thus incurred the odium of posterity? I need not trace the changes in the Cathedral during the last 240 years, although they reflect the domestic life of our nation during that period. Happily since 1643 the only invading hands which have marred the beauty of the building have been those of time and bad taste, and it is to repair their ravages that an appeal is made now not only to Englishmen, but to their brethren throughout the world.

PROFESSOR JEBB ON LOCAL ART.

THE twenty-second annual exhibition of the Glasgow Institute of the Fine Arts was opened on Monday evening. Mr. James King presided, and he said that, although in the galleries there were not so many pictures by artists of European fame as they had had in some former years, not a few English Academicians, as well as foreign artists of note, had contributed, and it would be found that the artists of the West of Scotland had never been more largely or more creditably represented.

Professor Jebb said that after Mr. King's remarks he hardly thought that there could be much need for many more words that evening, especially as the walls within which they were met had a voice so expressive, so various, and so eloquent—a voice which brought them messages from every realm of nature and life, from the mountains and the sea, from the winter and the spring, from the summer and from the falling leaf, messages from many lands recalling to many pleasant memories of holidays abroad, but perhaps bringing before them no scenes more impressively or more vividly than those which were nearest to them, the rocks and the bays of Scotland, its burns and its shores, its moorlands and its coasts. Human interest there was present in every form, with all its feelings, and, as Carlyle would have said, all its clothes, or some of them. One could not help thinking as he moved along the walls that life was represented as it was in the world—full of strange contrasts side by side, reminding one of what Arthur Clough said in one of his poems:—

Great is juxta-position.

His own acquaintance with the catalogue was too imperfect and too recent to enable him to illustrate this observation, but he thought they would find there *The Old Laird* next door to *The Little Beggar*; *The Revolutionist* next to *A Quiet Pool*; *A Great Secret* next to a circumstance so notorious and so familiar as *A Wet Day in George Square*; the editor of a delightful and able journal, of which he was a constant reader, next to *The Auld Wife ayont the Fire*; *Sir Garnet* next door to *Shy*; and *A Student*, as he observed with professional regret, next door to *Flirtation*. He had not come there, he was sorry to say, with a new definition of the beautiful, or even of the true, still less with a definition of art; nor had he any remarks of striking originality to offer on the social and ethical value of fine art; but he had a little to say on a practical point. There seemed to him to be a tendency to speak of provincial exhibitions of pictures in an apologetic tone, as if the best thing that could be hoped for was to follow London at a distance. In his opinion that was a complete mistake. It appeared to him that an exhibition of pictures at a great centre such as Glasgow had a function to perform quite distinct from that which could be performed by one of what were called the metropolitan exhibitions. Every exhibition such as the present had two sides—the cosmopolitan and the local. As they had just been told by Mr. King, the cosmopolitan element was admirably and brilliantly represented in that exhibition. It was also evident that the local side of the exhibition was remarkably strong and satisfactory. A committee of selection, and, still more, a hanging committee had always a very difficult task, and it would probably be rash to affirm of any such committee that they had ever given universal satisfaction; but there appeared to be reason to believe that in the present case the committee had approached as nearly as possible to that ideal state of things. The local art of Glasgow was probably never more largely or more brilliantly represented than it was this year. He ventured to think that the important feature in an exhibition of that kind was not the cosmopolitan element, but the local element. Art, and especially perhaps the arts of sculpture and painting, were suffering in this country at present under a very great disadvantage—a dis-

advantage which also affected many other interests. He meant excessive centralisation. London, the centre which was meant when we spoke of centralisation in Great Britain, was itself under the dominion to a very large extent of another influence, which in its way was perhaps as injurious to art—he should be disposed to think more so—as centralisation itself. He meant the influence of fashion. Fashion in matters of art was created principally by one or other of two causes, and very often by their joint action. The first cause was art criticism, the second was the personal notice of those who, perhaps, possessed no very great acquaintance with art, but exercised an enormous influence. In regard to the second of these causes, they had lately been reminded in a public and very striking manner how vitally such notice might affect the career of a sculptor. Though not quite so injurious, it was certainly equally true that it affected the career of a painter nowadays, in London at least, just as much. He did not propose to dwell on that influence, which was quite beyond the reach of argument, but on another—the influence of art criticism. It would be ungrateful to the art criticism of these islands to deny that it had been extremely good in many ways. It was from the Continent that we had perhaps had our great histories of art, such books as Jacob Burckhardt's history and many others: but in this country there had been, perhaps, a larger continuous supply of intelligent art criticism than in any other country in the world. To it we owed very great obligations, but it had not effected all the good which it had unquestionably done without some compensating, or, at all events, appreciable disadvantage. The drawback of art criticism was that it made a great many weak-minded persons affect to admire what in their hearts they neither admired nor comprehended. He could give a simple illustration of what he meant. Speaking of the frescoes of Domenico Ghirlandajo in the Church of Santa Maria Novella at Florence, a very great art critic observed that any person to whom they gave great pleasure was a vulgar person. Now, very many amiable and conscientious people were afraid of being thought vulgar, and nothing would induce them to confess that they really admired those frescoes. Without pretending to express an opinion on their intrinsic merit he ventured to say that in those frescoes there was a great deal which might be honestly admired, and which most people did admire. The inference from that was not that art criticism was a mistake, but that art criticism should be assimilated intelligently and sincerely by those who professed to act up to its counsels of perfection, and not merely to its rudimentary maxims. In order to appreciate good art an education of the mind and the eye was of course necessary—he should say an education of the mind before an education of the eye, but that was a matter of opinion. The object of such an education was to enable one to distinguish first the distinctly bad from the mediocre, then the mediocre from the good, then the good from the excellent, and the excellent from those few examples of supreme excellence which by the common instinct of the best judges stood at the head of all human art. At every stage the judgment which the learner formed must be sincere. He must not attempt to admire the good when he had only reached the point of admiring the mediocre, he must not pretend to admire the mediocre while in his heart he was still secretly admiring the bad. Until we had more sincerity, not in the art critics or the artists, but in the public, we should never have art reinvigorated from its only true source—Nature. Now, what could a local exhibition like that do? The pictures sent to a local exhibition were in a very large measure derived from the locality, and when he spoke of locality in reference to that exhibition he did not mean Lanarkshire, but Scotland. The native artist had obvious advantages, other things being equal, or nearly equal, for the faithful rendering of the scenes and the life which he knew best. It was the part of such an exhibition as that not merely to bring out latent talent in a particular locality, but also by the exercise of sincere and independent judgment on the part of the public to encourage those local artists to draw from the true source, Nature, and not to be guided by the fashion which ruled the London market. That was what he believed that exhibition was actually doing in a very large measure. Within the last twenty years a group of artists had been formed, or at all events enlarged and fostered, in Glasgow, mainly by the influence of such exhibitions as that. Consider for a moment how the great art of Italy and how the great sculpture of Greece were developed. Everyone knew in the case of Italy that from the age of Giotto to the end of the sixteenth century it was developed by a series of local schools acting and reacting on each other, each having its own well-marked characteristics. The school of Florence, the school of Padua, the school of Milan, the school of Bologna, the school of Venice, the school of Sienna, the school of Brescia, and many more were all within a comparatively small area of country, the one acting and reacting on the other, developing this and that aspect of art, and it was by their joint influence that the great Italian painting reached its perfection. And it was just so with old Greek sculpture. There was no reason why in this country they should not have local schools, and that exhibition was one of the agencies by which such a result might best be helped. He would make one remark which must strike everyone in reading the history of Italian painting in contrast with the actual condition of painting among ourselves. It was a well-known fact that some of

the greatest of the old Italian painters did their best work after middle life. Leonardo was past fifty when he did his best work. Titian and Michael Angelo were both old men; Giovanni Bellini was past sixty. These artists acted in the spirit of the sixteenth-century Italian engraving, which represented an old man seated in the chair of a child, "I grow old, still learning;" and when Nature had again become the predominant source of British art it would be so in this country also—there would be a vitality and a progress traceable from the natural source throughout the artist's career. He could not conclude without saying how much he thought they all owed to the president, whose absence was so much regretted, the vice-presidents of the council, and officers of the institute. Their labours ought to be formally recognised by those who were indebted to them for their enjoyment. He had also to mention that the principal loan pictures had been sent by the president and council of the Royal Academy, the Earl of Dalhousie, Rev. Dr. Burns, Messrs. James Donald, James Duncan of Benmore, Muir, Henderson, Connal, H. L. Anderson, Pollok, Marshall, Hargreaves Dunlop, Dickie, Fry, Dixon, Ramsay, and Orchar. It was now his very pleasing duty to move a vote of thanks to the gentlemen who had so kindly lent pictures to the exhibition, and to couple it with the name of Mr. Muir.

NATIONAL ASSOCIATION OF MASTER BUILDERS OF GREAT BRITAIN.

THE fifth annual meeting of this Association was held on Tuesday, the 30th ult., at Liverpool, when the report and balance-sheet were read by the secretary.

The president, Mr. Stanley G. Bird, in moving the adoption of the report, said it might be thought that it was a very meagre one to present, still it contained several matters of the highest importance to the trade throughout the country. Firstly, he had to congratulate the meeting on the amicable relations which existed between employers and employed, which was no doubt in great measure due to the extraordinary depression in the building trade both in London and the provinces. The depression was a source of regret to all, and he was sorry to say that the prospects of improvement did not seem very bright. Secondly, he regretted that during the last few months Mr. Potter, by his letters in the *Times*, had tried to stir up an agitation in the trade, and had gone out of his way to make a gratuitous attack on this Association; he (the president) had answered the letter, pointing out that the motto of the Association was Defence not Defiance. He was happy to say that the policy of the Association was to try to prevent strikes, and he was glad that up to the present their endeavours had been eminently successful, no great strike and very few small ones having taken place during the existence of the Association. Thirdly, the question of deficient and improper quantities was most urgent. Two very important actions had lately been tried at Liverpool, and it was high time that this matter should be taken up, and he again urged on the builders the great necessity for obtaining fair and equitable conditions of contracts. The form agreed to by the Royal Institute of British Architects, which had been adopted by the National Association, although it was now in more general use, was not employed to the extent he could wish. The council recommended the appointment of a sub-committee to go into the whole question of quantities and form of tender, with a view to obtaining a conference with the Royal Institute of British Architects at an early date to settle these most important questions.

The adoption of the report was seconded by Mr. Robert Neill, of Manchester, and carried.

The President then drew the attention of the meeting to the working of the Builders' Accident Insurance Company, which was established under the auspices of the National Association, and strongly urged the trade to support the company, which was established on strictly mutual principles. He quoted one case where the insurer had only paid 6*l.* 6*s.* premium, and the company had paid 223*l.* in compensation, together with the costs of an action.

The meeting next elected the officers and council. Mr. Stanley G. Bird, of London, was re-elected president for the third time, with Messrs. R. Neill, jun., and W. H. Cowlin as vice-presidents. It was announced that the next half-yearly meeting will be held in Edinburgh. In the evening the Liverpool Builders' Association entertained the Council of the National Association and a large party of friends at dinner at the Adelphi Hotel, Mr. Edward Hughes, the president, in the chair. The toast of success to the National Association was proposed by Mr. Samuel H. Holme, who pointed out the necessity of the Association, and that since its establishment the relations between employers and their workmen had been more friendly, and their differences more readily adjusted. The toast of the President of the Liverpool Association was proposed by Mr. Clay, of Manchester.

Mr. A. J. Gale will read a paper, entitled "Some Notes on Professional Practice," at the meeting of the Architectural Association on Friday evening, the 16th inst.

NOTES AND COMMENTS.

It has been officially announced by the Consul-General that the Italian Government have decided upon inviting another International Competition for a design for the proposed National Memorial of King VICTOR EMANUEL II., which is to be erected in Rome. All competitions attract designs, no matter how infinitesimal may be the chance of success. But in this case there ought to be some forethought exercised before designs are prepared by English artists. It was known at the time of the first competition that there was a prejudice against all foreigners, and in consequence many ingenious devices were adopted to conceal the nationality of some of the competitors. But they were without avail, for the result demonstrated that no Italian Government would dare offend the electors by giving the commission to an English or French artist. It would save much labour and expense if the Italian authorities accepted the inevitable and confined the competition to their countrymen. But then they would lose the opportunity of displaying their liberality at the cheapest possible rate.

WHAT is to be done with the statue of the late DUKE OF WELLINGTON when it is removed from the summit of the arch will shortly become a subject of debate. It is well known that the DUKE was unable to see the absurdities of the figure, and he regarded the suggestion that the statue should be taken down as a slight to himself. "They must be idiots," he once wrote on the subject, "to suppose it possible that a man who is working day and night in the public service, without any object in view excepting the public benefit, will not be sensible of a disgrace inflicted upon him by the Sovereign and Government whom he is serving." The DUKE failed to perceive that the opposition to the statue partly arose from the fact that it was an unworthy representation of him. THACKERAY, on acting as a guide through London for JULES JANIN, gravely informed the French writer that the subject of every bad statue was the Hero of Waterloo, and so many of the WELLINGTON statues are defective there were grounds for the joke. When it is suggested, as has been done by Sir W. H. GREGORY, that the Hyde Park statue should be placed in some conspicuous position close to Apsley House, hero worship is overcoming good taste. There is already a curious figure in Hyde Park, supposed to represent ACHILLES, which was cast at the expense of the ladies of England, as a memorial of the DUKE. Surely it is enough for the neighbourhood.

THE late GEORGE MASON was an artist of whom any country might be proud, and by his death in 1872 England lost one of her chief poet-painters. But his works were few, and it is difficult for the general public to appreciate his peculiar qualities. MASON'S works are also hard to copy on wood, steel, or copper. At length Mr. R. DUNTHORNE, of Vigo Street, has been able to produce a plate from one of the best of MASON'S works—the last by him which was exhibited at the Royal Academy. Mr. ROBERT MACBETH, A.R.A., whose paintings show affinity with MASON'S style, some time ago accepted a commission to etch *The Harvest Moon*, and the plate is now ready for publication. In size it measures 36 inches by 14 inches, and from its form is better fitted for decorative purposes than most engravings. Mr. MACBETH has given a delightful rendering of the original; his etching has the dreamy character of MASON'S painting, and landscape and figures are combined with no less charm. A work of this kind is a recognition by one artist of the genius of another, and a copy of the print is worth scores of some etchings which have secured popularity.

THERE was much opposition in the City when it was first proposed to purchase no more than the lower parts of warehouses for the extension of the Underground Railway, owing to the enormous value of property. The directors of the proposed Glasgow, City, and District Railway, have imitated the example that was set up in London, regardless of the difference in the conditions of the two schemes. About two miles of the Glasgow railway is to be tunnelled, and it is expected that owners of property will agree to what is known as a wayleave, or in other words accept some trifling compensation for surrendering so much of their ground as may be needed for the construction of the line. The Lands Clauses Consoli-

dation Act states, "That no party shall at any time be required to sell or convey to the promoters of the undertaking a part only of any house or other building or manufactory, if such party be willing and able to sell and convey the whole thereof." But the Railway Company boldly got over the difficulty by affirming that the substratum does not form part of a house, building, or manufactory. In other words the old maxim, *Cujus est solum, ejus est usque ad cælum*, has become obsolete, and the rights of an owner of the surface no longer extend to the centre of the earth. The London directors obtained special legislation, but in Glasgow the common law appears to be relied on. Another point that is remarkable about the proposal is the indifference to actions for damages to property. In ordinary cases it is considered more economical to purchase buildings in the neighbourhood of a line that are likely to be affected by the operations of the contractor, but the directors of the Glasgow railway think there is no risk of settlement or other injury to houses by removing the muddy sand which forms the foundations. If the contractor is to become responsible, the amount inserted in his estimate for contingencies will not be a trifle.

A MEETING was lately held of the Committee who are opposing the arrangements for the erection of a new museum in Dublin, at which the speech of the Lord-Lieutenant to the deputation was considered. The Committee maintain that the subordination of the Irish Department to South Kensington is opposed to the wishes and opinions of the Irish people, and if persevered in will fail in the future as it has in the past. A new scheme should therefore, it is said, be prepared, providing for an independent Irish department. The erection of the museum buildings on the proposed site would, it is stated, "be an utter waste of public money." It is suggested that three houses in Kildare Street should be purchased, when, including the courtyard, there would be available a site with 491 feet frontage. The final suggestion which represents the object of the agitation is, "That the proper course is now to issue fresh instructions to architects under the auspices of a representative Irish committee." But what in Ireland is a representative committee it would be difficult to determine.

THE Governors of the Heriot's Hospital, Edinburgh, have lately been considering certain matters in connection with the management of their Trust. It is expected that, as an outcome of their deliberations, substantial aid of a pecuniary nature will be contributed to the Watt Institution and School of Arts. It is stated, in fact, that the Heriot Governors contemplate spending a sum of 12,000*l.* for the extension of the Watt Institution buildings in Chambers Street, besides a large annual contribution towards its endowment.

A SUB-COMMITTEE of the Glasgow Town Council has been appointed to select the stone for the new municipal buildings. Quarries at Bannockburn have been visited, and specimens of the stone obtained there are under analysis. It is proposed to visit other quarries. Amateur investigation of the qualities of stone are not always successful, and even when men who have a reputation as geologists co-operate for the purpose, there is more than a probability of failure. If the selection of stone for the Houses of Parliament had been left in the hands of the architect, the building need not now be crumbling. The same result is to be witnessed in America. Pains were taken by scientific experts to discover the quarries with the strongest stone in order to build the Albany Capitol, but what was selected quickly failed. There may, however, be more success in the case of Glasgow.

A PUBLIC meeting to advocate the preservation of Croydon Palace is to be held at the Public Hall, Croydon, on the 9th inst. Some contributions have already been promised to secure from destruction this ancient and historical residence of the Archbishops of Canterbury in Surrey. A sum of about 5,000*l.* is required, and it is proposed to convert the building into a free library and museum, some part being reserved as a memorial to the late Archbishop TAIT. All interested in this movement are requested to communicate with Dr. ALFRED CARPENTER, the honorary secretary, or to Mr. S. W. KERSHAW, F.S.A., Lambeth Palace. The features of Croydon Palace are known to most architects, and its interest, which was both antiquarian and local, has now become of almost a national character.

PULPIT, CHRIST CHURCH CATHEDRAL, DUBLIN.

G. E. STREET, R.A., ARCHITECT.

PROPOSED SO

MESSRS JOHN & J

Feb 10th 1883.

KENSINGTON GALLERY.

BELCHER, F.R.I.B.A. ARCHITECTS.

SOUTH-EAST CHAPEL, CHRIST CHURCH CATHEDRAL, DUBLIN.

G. E. STREET, R.A., ARCHITECT.

ILLUSTRATIONS.

SOUTH KENSINGTON GALLERY.

THIS illustration is taken from a water-colour drawing by Mr. HAIG, and represents a view of central dome and vista, formed by contemplated Art Galleries at South Kensington. Designs and estimates for these have been prepared by Messrs. JOHN & JOHN BELCHER, F.R.I.B.A., and embrace the original proposal of the late PRINCE CONSORT, which, if carried out, would prove both a financial success and an advantage to the neighbourhood.

The proposed scheme is on the plan of foreign galleries, having a covered central avenue, and art show or exhibition rooms on either side; well-lighted studios being arranged on the first floor, entered from an upper gallery, which runs round the whole building, and to which access is obtained by eight grand staircases.

In connection with the Gallery is a large club, with committee, lecture, and reading-rooms, &c.

The buildings have been designed to accord with other public buildings in the vicinity, and the internal decorations are arranged to be carried out in coloured marbles and "Della Robbia" ware, with provision for the introduction of statues, &c., and also for the exhibition, permanent or otherwise, of sculpture generally, to which it will be well adapted.

The estimated outlay is 118,000*l*.

ILLUSTRATIONS OF CHRIST CHURCH CATHEDRAL, DUBLIN.

WE publish this week two more of the engravings from the volume on Christ Church Cathedral, Dublin, which has been produced by Messrs. SUTTON SHARPE & Co.

SOUTH-EAST CHAPEL.

One view represents the south-east chapel from the south choir aisle. The choir is apsidal in plan—thus following the lines of the crypt—and beyond is the lady chapel, which is rectangular in plan. On the north and south sides are small chapels, which are continuations of the aisles in the western part of the Cathedral. Among the chapels on the south side the eastern is alone rectangular, and this will explain the peculiarity of the converging south side shown in the illustration, and which aids in producing what Mr. STREET calls "charming effects of perspective." The following is his description:—

The treatment of the eastern chapels and of the aisles round the apse was a matter of no little difficulty. The groining bays in the aisle were of necessity awkwardly irregular in plan, and there was great risk of spoiling the whole work by any mistake. It is hoped that none was made. The whole work is as elaborate in detail as possible, and has been admirably wrought. In the engraving, taken from the south side, just outside the westernmost arch of the choir, the pier on the left is the old one which gave most of the data for the restored arcade, but all the rest of the work is new. The walls are all arcaded below the windows, with a continuous seat under the arcading; and the varied angles and lines of the structure, following exactly those of the crypt underneath, produce charming effects of perspective, and are full of light and shade. The chapel, seen at the end of this view, is the southern of the three eastern chapels; each of these, of course, had originally an altar, and for many reasons it would have been convenient if one could have been placed in the central chapel, for use when the communicants are so few as to make it inconvenient for them to join the service at the altar in the choir. This, however, could not be, and as the chapels are very small, and do not project far beyond the passage-way round the choir, there is not so grave a sense of defective use as there usually is in such a case. In the central chapel the arcade round the walls has a principal seat in the centre for the Dean, in case at any time he should desire to summon the Chapter for consultation within the walls of the church.

THE PULPIT.

The pulpit stands on the right or northern side of the nave, near the chancel screen. The materials are stone and marble, and the statues of the Evangelists occupy the four niches on the upper part. The hand-rail of the stairs is a balustrade of marble shafts.

STUDIES FROM LIFE.

THE studies which appear in the illustration have been reproduced from drawings by M. LECHEVALIER-CHEVIGNARD. They were utilised by him in a large decorative work which he lately finished. The artist's career was described in an article published in *The Architect* in March 1881. M. LECHEVALIER-CHEVIGNARD might be supposed to be in danger

at the present time in France. He has received commissions from the Orleanist princes and from Prince NAPOLEON to adorn their mansions. When M. ROUGEON was appointed the architect for the Pompeian house which Prince NAPOLEON desired to possess, M. LECHEVALIER-CHEVIGNARD was specially sent to Pompeii in order to prepare the designs for the ornamentation of it. At the suggestion of M. PAUL BAUDRY, a commission was given to him for the decoration of the library of the Duc de CHARTRES, a prince of whom French politicians appear to be afraid; and subsequently the Duc d'AUMALE entrusted M. LECHEVALIER-CHEVIGNARD with important commissions, one being the restoration of the remains of the painted glass by JEAN COUSIN, which the Duke esteemed as treasures. But, on the other hand, M. LECHEVALIER-CHEVIGNARD has been favoured by the Republican authorities. He was selected by the Senate to depict the courage of the inhabitants of Chateaudun in defending their town against ten thousand Prussians; he copied the *Sposalizio* at Milan for the Beaux-Arts; he designed tapestries for the Gobelins, and painted the grand staircase at the Sevres factory. Lastly, he has served the Government by accepting a professorship of decorative art at the Ecole des Beaux-Arts.

THE ARCHITECTURAL ASSOCIATION.

THE sixth ordinary meeting of the Association was held on Friday evening, the 2nd inst., Mr. E. G. Hayes, President, in the chair.

A vote of thanks was passed to Mr. May in connection with the late visit. The next visit, it was announced, would be made on Saturday, February 10 (to-day), to the new Oratory at Brompton.

The Position of Choirs and Organs in Churches.

Mr. W. H. BREWER then read a paper under the above title, as follows:—

The importance of music as an accompaniment to the service of the Almighty has been acknowledged in every age, and by every form of religious worship with which history has made us acquainted; and to realise the extraordinary attention which this branch of sacred art received at the hands of the people of old, we have only to open the Holy Scriptures and read the account given in the Second Book of Chronicles on the dedication of Solomon's Temple, in which we are told that there were present, amongst others, "the Levites which were the singers, all of them of Asaph, of Heman, of Jeduthun, with their sons and their brethren, being arrayed in white linen, having cymbals and psalteries and harps, stood at the east end of the altar, and with them a hundred and twenty priests sounding with trumpets." In the earliest days of Christianity we also read of "singing hymns," and all through the Middle Ages the same importance continued to be given to music in connection with the services of the Church. Charlemagne, who, we should have thought, had quite enough business upon his hands to occupy all his time, yet considered it his duty to become acquainted with the discussions going on as to the correct number of the Gregorian "modes" or tones to be used in church music; and Robert, King of France, absolutely conducted the choir of his royal chapel, arrayed in his coronation robes! Although the Eastern Church also cultivated music, yet there was a great disregard of practice, the Western Church admitting the use of instrumental accompaniment, and the Eastern Church strictly prohibiting it. However, it should be noted that the use of instrumental accompaniments is not, and never was, universal, even in the West; and it is a well-known fact that neither organ nor orchestra have ever been admitted into the Pope's own chapel, the Sistine, nothing but pure vocal music being allowed. I believe also that the Cistercian and several other religious orders are forbidden by their rules to have anything but vocal music in their churches. Until some twenty-five years back instrumental accompaniments were forbidden in the diocese of Lyons, and the Roman Church still prohibits the use even of the organ at high mass on the Sundays of Lent and Advent.

Long before the Reformation, most large churches in England possessed one or more organs. Durham Cathedral in the fourteenth century had as many as five. The Reformation in England does not seem to have had any perceptible effect upon Church music, and in most cases the organs remained. The case was very different, however, with the Revolution. The Puritans seem to have vented their spite upon organs more than on any other article of church furniture except alone the altar, and a very lively account of their proceedings at Peterborough is given in "*Mercurius Rusticus*," but which is too long to quote here.

To the German Lutherans, however, must be allowed the credit of having developed the organ into the magnificent instrument which it has now become, and the immortal genius of John Sebastian Bach has given a literature to the instrument such as is possessed by no other, and is scarcely surpassed by the orchestra itself.

Ecclesiastical music had fallen into a very low condition in this country some forty years back, and those who are old enough can well recollect the state of things which then existed. The cathedral choirs were, of course, an exception, but even in cathedrals the organs were totally inadequate, few of them possessing a properly-arranged pedal-board, and all of them tempered according to the wretched old system, by which music could only be played in about three keys, and if written in any other it had to be transposed. These instruments, however, often had a fine effect of tone, from their position upon the choir-screen. The organs in parochial churches were, as a rule, dismal affairs. It is true that a few organs by Father Smith, Renatus Harris, &c., were to be found in some of the city churches; but even those would be looked upon as totally inadequate to modern requirements, although they undoubtedly possessed a delicacy of tone that was very charming as far as it went. The choirs in parochial churches scarcely deserved the name, and in village churches the music was often ridiculous. Organs were almost unknown, and the terrific instruments of torture, the "Seraphin," the barrel-organ, and the "self-acting grinder," were amongst the favourite substitutes. The shocking tricks which these instruments played often caused consternation among the worshippers. I knew of a "self-acting grinder" which had the disagreeable habit of occasionally treating the congregation to the whole of its twelve tunes, one after the other, if by accident the man in charge did not make a rush at it and hit a certain knob or button just at the right minute. And a friend of mine related to me a very remarkable scene at which he was present, and which happened at a village church in Buckinghamshire, many years ago. A hand-grinding organ was the hero in this case. The "professional" performer upon the instrument happened to be absent, and an amateur undertook to serve for him. When the hymn was given out he took hold of the handle and ground and ground away, but nothing came of it all but a weeping sound. In a state of intense alarm the unfortunate performer rushed to the front of the gallery and cried out, "Oh, yer reverence, this 'ere organ has gone and busted itself!"

The old village orchestras, which may possibly have been of value in earlier times, had died out or dwindled away until they had become worse than useless. I recollect a very old clerk, in a church near Norwich, who used to lead the singing with a cracked clarinet, and I remember his telling me that many years ago there was a full band, of which he was the only survivor. As, however, he told me this nearly thirty years back, and he was then over eighty, probably the band had been given up sixty or seventy years ago.

The very remarkable revival of ecclesiastical music in this country during the past thirty or forty years, and the wonderful development of the organ during the same period, have of necessity had an effect upon our ecclesiastical architecture and the arrangement of churches and chapels. For, wonderful as has been the improvement of the musical arrangements in Anglican churches, it has been equally remarkable amongst Congregationalists and Dissenters generally. In years gone by a hymn bawled in unison was considered sufficiently artistic in places where now one will hear first-rate choral singing, accompanied by a very excellent organ. Oratorios and organ recitals are also greatly favoured by our Nonconformist fellow-countrymen, who are doing much for the development of musical taste in connection with religious worship.

In the Roman Catholic churches of Germany a somewhat remarkable movement has taken place in connection with ecclesiastical music. It is the abandonment of the orchestra and the orchestral style of composition, of which Mozart and Haydn were such notable masters, and the revival of the earlier and severer, or vocal style, which is exemplified by the magnificent compositions of Palestrina, di Lasso, and Sorzano. The disappearance of the orchestra is leading to increased importance being given to the organ. Pugin complained some thirty years back that when the choir struck up in Cologne Cathedral with its orchestral accompaniments, the columns and arches of the building seemed to disappear and to become replaced by the pit, boxes, and stage of the Italian Opera. He would find no cause for the complaint now, as the operatic singing is replaced by the severest church compositions, and the orchestra has been abolished, and is about to be replaced by the largest church organ ever erected. This movement has now spread so far in Germany that in addition to the Cathedral of Cologne it has been adopted in those of Ratisbon, Mayence, Aix-la-Chapelle, Münster, Eichstädt, Treves, Leichteritz, &c.

I have been obliged to dwell upon these musical facts at some length, because they serve to show that the organ is every day becoming a more and more important adjunct to religious services; and during the last thirty years the progress which has been made in organ-building, and the enormous improvement which has taken place in everything connected with that instrument, is a remarkable fact in the history of music. Those who compare the organs erected half a century back with the magnificent instruments constructed by our leading English firms at the present time, are simply astounded at the ingenious inventions and contrivances which have been introduced to overcome difficulties which rendered the older organs generally almost unplayable, and always

most fatiguing to the performer. It must not, however, be forgotten that the more perfect the organ is the larger its bulk becomes, and the greater becomes the difficulty of the architect in finding a suitable place for it in a church or chapel.

In mediæval times, and, in fact, as a general rule, until some thirty or forty years back, the organ gave an architect little trouble. As long as it was enclosed in a case some 10 feet by 5 feet and about 16 feet high, it could be placed almost anywhere, and it did not demand consideration in planning a church; but when the same thing becomes a structure 20 feet square and 30 feet high it can no longer be ignored, and provision must be made for it or it will become a serious disfigurement to the building. The difficulty must be boldly grappled with. It is simply useless for an architect to complain of the size of an organ or to suppose that it should be made smaller, so as to occupy less space: he might just as well complain of the size of a dining-table when he is designing a dining-room. The thing is wanted and must be provided for, and the architect must discover some means of meeting the difficulty. I acknowledge that it is often a serious difficulty, but there is not the slightest chance of its vanishing or even becoming modified, as in all probability organs will get larger and larger as time goes on. All attempts at decreasing their size have hitherto proved complete failures.

There are, of course, several things to be taken into consideration in selecting the position for an organ. The first and most important is that the instrument should be placed where it will be heard to the best advantage; the second is that it should be in such a situation that it may be serviceable both for the choir and also for congregational singing; the third, that it should be placed where it will be secure from injury arising from damp, excessive draughts, variations of heat and cold, and especially leaky roofs. The gutter of a roof should never, under any circumstances, be carried over the organ; yet in two new churches which I have lately seen the organ is placed under the valley between two roofs. In another church, recently restored at great expense, I noticed a few weeks since that the gutter over the organ was insufficient; the consequence was that the open diapasons were receiving a regular *douche*, and the water was running out of the lips of the pipes! I pointed this out to the sexton who was showing me over the church, and he said, "Well, sir, our organist *do* complain. A few Sundays back the water came down on his head during morning service; but what can be done? Our parson has spent a deal of money over that gutter!" I suggested that at any rate the organ ought to be removed. Lastly, an organ must be placed in such a position that it is, if not an ornament to the building, at least no disfigurement to it.

Now, there are not many positions which a large organ can occupy in a church so as to fulfil all these conditions, and it is not surprising that it should have created a new feature in church architecture—the organ-chamber—which seems to be popular amongst Anglican clergy, as it is to be found in very many new churches, and has been added to not a few ancient ones, sometimes, I am bound to say, not to their improvement. It is, in fact, greatly to be doubted whether it is always advisable to remove an organ from the western gallery where it has formerly stood, to place it in a kind of black-hole at the side of the chancel. This is often done under the idea that the position is more in accordance with ancient usage; but in point of fact, while there is plenty of mediæval authority for the western choir and organ-gallery, there is none that I know of for an organ-chamber, which is an essentially modern feature in church architecture. Ancient organs in western galleries occur at Amiens Cathedral; the Cathedral of Constance; St. Mary's, Lübeck; St. Anne's, Augsburg; St. Ulrich's, Augsburg; and although the organs have disappeared or have been rebuilt, ancient western organ-lofts are to be seen at St. Stephen's, Vienna; Ulm; Liège; St. Mary's, Würzburg; Ochsenfûrth; the Carmelite Church at Boppard; St. Pantaleon at Cologne, &c. The last-named example, however, is so singular in its arrangement that it may have been removed from some other position.

The reason for placing the organ in an organ-chamber is that it may be near to the choir, who are now usually placed in the chancel. Whether the choir of laymen was in the Middle Ages commonly placed in the chancel seems doubtful. That the chancel was nothing like so universal a position for the singers as is generally supposed seems proved by the arrangement of many ancient churches. For instance, in the old abbey church of Corneli, Münster, *e.g.* near Aix-la-Chapelle, the choir, with its stalls and complete ritual arrangement, is to be seen in the western gallery. The same is the case in one of the earlier of the abbey churches, that of Seligenthal, near Landshut, where the front of the choir-gallery is adorned with a series of beautiful old pictures, and the interior fitted with regular choir stalls. The same arrangement is to be noticed at the Abbey of St. Maximin at Treves, though unfortunately here the whole of this interesting portion of the church is much modernised. At the minster church at Roermond the arrangement of the choir was very singular. It was divided into two parts, each of which occupied one of the triforia of the nave. Each triforium choir terminated to the east in a small apse, bracketed out into the transept, containing an altar, both of which still exist. The original high altar also exists, not in the great

apse, but in a smaller apse projecting from its eastern extremity. M. Cuypers, who has very carefully restored this church, believes the position to be original. There is a rather later western organ-gallery, but the whole is thirteenth-century work. The curious church called the *Alte Pfarrkirche* at Ratisbon contains a singularly small chancel—only about 10 feet square—but has a very deep choir-gallery at the west end. The stalls have been removed, but the marks of where they were fixed can still be traced. The date is thirteenth century. At Coburg there was evidently a western choir in a gallery, with a little apse built out over the principal doorway. The arrangement is very picturesque externally. At Limburg-on-the-Lahn the great triforium, which is vaulted and furnished with several altars, is called the “*männerchor*.” Whether it really served the purposes of a choir is a question which it is not possible to settle, but the name would seem to suggest it.

Notwithstanding the fury which has of late years been exercised against western organs and choir-galleries, there is much to be said in their favour, and it would perhaps be well to hesitate before removing them, especially in old churches. The west end of a church is an excellent situation for a large organ, both musically and as regards its appearance. The splendid examples at Lübeck and Bois-le-Duc, and St. Anne's, Augsburg, serve to show what a fine feature can be made of an organ in this position. Musically speaking also, the western gallery is a good position for a choir, and the arrangement lends itself very well to congregational singing. Much good carving and excellent work has been destroyed by the wholesale removal of west-end organ-galleries. I cannot help also regretting the destruction of the numerous fine Renaissance organ-cases which have disappeared together with the western organ-galleries.

The organs in cathedral churches, in England at any rate, were generally placed upon the chancel or rood-screen, and it is impossible to suggest a better situation for the instrument, as every single favourable condition is here complied with. The organ has plenty of space about it, and it is, consequently, sure to sound well. It is away from any walls which could convey its sound out of the building; it is excellent for choir work, and also for congregational purposes; it is more safe from damp and draughts than in any other part of the building, and less liable to variations of temperature. The position has also the sanction of antiquity, as it is recorded that there were organs upon the rood-screens of Durham, Peterborough, York, and Winchester Cathedrals long before the Reformation. In Continental churches a few organs still exist in this position. The Cathedral of Bruges, and that of St. Gomarre at Lierre, are cases in point; though, singularly, in the latter church the organ is sunk into the screen in such a way as to be invisible from the nave of the church. The removal of organs from choir-screens has been greatly in favour of late years, but I trust to live to see them all replaced in their former position. It seems that King Charles I. inaugurated this movement by ordering the removal of the organ in York Minster because it prevented the great east window being seen from the nave. It was, however, subsequently replaced.

When the organ is placed upon the choir-screen, one of two things seem to suggest themselves: either the congregation should be excluded from the choir, or the singers should be placed in the organ-gallery. The present plan of mixing up the congregation and singers in the choir-stalls of the English cathedrals has many great objections. In the first place, it is not edifying to look down the throat of a man just opposite who is singing a solo, nor is it advisable to recognise too distinctly any individual singer in a church. One may have heard him sing music of a very different character under very different circumstances, which it is undesirable to associate with his present performance; and yet the mind cannot help making this association, to the entire destruction of all solemn thoughts and religious feelings. It is also a great advantage to every choir to have a conductor, and not to trust too implicitly to the organ. Where music in the style of Palestrina is sung unaccompanied, a conductor becomes absolutely necessary. Now a conductor is strangely out of place in the middle of a congregation.

The destruction of choir-screens, both here and on the Continent, is to be regretted. Not only are these screens great ornaments to churches, but they are of considerable use for musical purposes. The magnificent rood-screens at Münster and Bois-le-Duc were, when I first recollect them, used positively as choir-screens, and the effect was remarkably fine. Both have now unfortunately been removed. I am told that the screens at Tournay and Bruges are threatened with the same fate, chiefly because they are not Gothic. Some years back the choir of Norwich Cathedral sang from the screen, and I fancy there must be ancient authority for this usage. In France the rood-screen is called “*jube*,” and I cannot help associating this name with the first word of the Complin service—“*Jube, Domine, benedicere*.” Possibly the Complin service may have been sung from the rood-loft, and hence the name “*jube*,” as given to this feature of church architecture. In Germany the rood-screen is called by a different term in almost every church. At Münster it was called “*Aposteln-gang*,” I fancy from the statues of the Apostles who adorned it. At Halberstadt it is called “*Bischofstuhl*” or “*ambon*,” whether it

really served as a bishop's throne or no it is impossible to say. At Hildesheim it is called “*Letner*,” a word closely akin to our word “*lectern*,” probably because the Gospel was read from it. It should be noted that although the rood-screen has generally been destroyed in France, yet the Gospel is always read from the place where it formerly stood. In some old descriptions of churches I have found the word “*pulpitum*,” used to signify the rood-screen.

Another position for the choir is to the rear of the altar. It is certainly the most ancient of all positions, as may be seen by the arrangement of the basilican churches. It is an excellent position from every point of view, and remarkably convenient, especially in apsidal churches. The great difficulty, however, is the organ. In French churches, where this arrangement is not uncommon, there are generally two organs—one a small instrument for the choir, and the other placed in the nave of the church for voluntaries and congregational purposes. The disadvantage of this is, of course, its expense, as it necessitates two organs and two organists. I am aware that there is an invention by means of which the same organist can play both organs at once by the application of electricity. It would be very desirable that this invention should succeed, but owing to the expense, or some mechanical difficulties, it has not met with the success which one could wish. I trust, however, that it will not be lost sight of, for, if it can be made thoroughly practicable, it would solve many difficulties, and it may turn out to be of the greatest possible value, both from an architectural and musical point of view.

The choir of Ratisbon Cathedral, which is justly celebrated all over Europe for its efficiency, consists of two separate bodies of voices, one composed of clergy, theological students, &c., who are placed in the stalls in front of the altar, and sing the plain chant; and the other of professional singers, who sing the harmonised music, and are stationed in the apse, behind the high altar. The organ is immediately behind the *rearedos*; it is a small but singularly good instrument, as far as it goes. Above the stalls, on either side of the choir, are stone galleries bracketed out, which are reserved for the use of clergy of distinction who are unconnected with the cathedral. This seems to me to be a very excellent idea—one which might well be adopted in other places—because it obviates a difficulty. Strangers ought never to be admitted into the stalls of a cathedral under any condition whatever; yet it is desirable to have some place for foreign ecclesiastics visiting the church. While I was at Ratisbon I noticed that one of these galleries was occupied by an Armenian bishop and his attendants. I must here call attention to a somewhat remarkable but very successful experiment which was made at this cathedral some years back. The plan of the cathedral is remarkably symmetrical, and when it was restored, numerous positions for the professional choir and the organ were suggested. Both were removed from place to place to discover where they would be most effective. The organ, which is, as I have said, a small instrument, was found to be totally insufficient everywhere except when placed in the apse, where, owing to some extraordinary acoustic properties of the buildings it has the effect of a large and powerful instrument. It was also discovered that the same effect was produced by the choir, so that a body of some twenty voices was found to produce the effect of a very large choir; it was, however, found necessary to play and sing the music very much slower than it would be ordinarily taken; a false note or a breakdown would, of course, be multiplied fourfold, and what would be the result of a cypher on the organ I tremble to think. Such things, however, do not happen with the Ratisbon choir, and I do not think that anything could surpass the superb unaccompanied music of Palestrina, as rendered by this choir and in this cathedral—it seems to wind round and about the lofty columns, and in and out of the stately arches in a way that baffles all description. I went to the church over and over again before I could discover where these grand waves of harmony proceeded from. This is the only case I know of in which the choir and organ have been placed and arranged with a view exclusively to the acoustic properties of the building, and yet one would naturally have expected to find such a proceeding rather the rule than the exception. The arrangement of organ and choir behind the high altar is not uncommon in France, and wherever I have heard it, the musical effect is remarkably good.

In cruciform churches one of the transepts is an admirable position for the organ. A very fine and effective instrument has been erected in the south transept of Worcester Cathedral.

The aisles of a church are not a good situation for organs without they are like those in the German churches—remarkably lofty. Ancient organs in this position are to be found at St. Afa, Augsburg; at St. Stephen's, Vienna; at Nordlingen, in Suabia; at Ingolstadt, in Bavaria; and at the Cathedral of Erfurth. The organ-lofts in each of these cases are very charmingly designed; all these churches, however, possess an organ at the west end in addition to that situated in the aisles. There is a gallery at the west end of the north aisle of Winchester Cathedral which was probably formerly an organ-loft, though we know that the principal organ of the church stood on the rood-loft. Another very favourable ancient position for the organ was in a gallery bracketed out from the triforium of the nave. The ancient organs at Chartres, Freiburg, and Strasburg are in this position; and, in all pro-

bability, the so-called minstrels' gallery at Exeter was nothing more than an organ-loft. We know also that, in addition to four organs in different parts of the church, Durham Cathedral had an organ corbelled out from the triforium of the nave. Although it is a fairly good position for a moderate-sized organ, yet it has several drawbacks; the organ is generally too high up to be quite satisfactory, either for accompaniment or as a solo instrument. Undoubtedly an organ sounds better when raised above the level of the heads of the congregation; but some of its tone must be lost when it is raised some 50 feet or 60 feet above the pavement.

Old organs were very frequently placed over the choir stalls. That of the old Cathedral of St. Paul was in this situation, and the Cathedral of Milan and many Spanish and Italian churches are examples in point. Unless, however, the choir projects west of the transepts, so that the organ can stand under one of the arches of the crossing, there is scarcely sufficient space for a modern organ of large dimensions, and it has led to the very objectionable practice of cutting the organ in half, and placing one half on one side of the choir, and the other half on the opposite side, the two being connected by trackers underneath the floor. It is useful, however, sometimes to have a small organ over the stalls when there is a large organ in another part of the church. This is the case at Worcester Cathedral.

We sometimes, though very rarely, find old organs placed on the ground to the east of the stalls; and it is to be remarked that the only pre-Reformation organ-case existing in England, that of New Radnor Church, is in this position. Occasionally the organ is placed on a gallery at the back of the altar. Handel's organ at Whitechurch is in this situation; both organ-case and choir gallery were designed by Wren. In some of the Lutheran churches in Germany the organ is over the altar. It is so at St. Anne's, Augsburg; but there the altar is the intruder, as the fine old organ holds its original position at the west end of the church, and a modern altar is placed under it. I think it was at Ludwigsburg I saw a singular three-decker arrangement, not pulpit, reading-desk, and clerk's desk, as one sometimes sees in England, but an altar below a pulpit immediately above the altar, and an organ above the pulpit.

(To be continued.)

LEEDS ARCHITECTURAL ASSOCIATION.

A PAPER on "Art Foliage" was read by Mr. J. K. Colling at the meeting of the Leeds Architectural Association on Monday. He said:—

Few attempts had been made in modern times to give architectural foliage its proper character of art workmanship. We go on reproducing and copying the works of former ages, and appear to be quite satisfied if in doing this we are able to produce a tolerably faithful imitation of old work. Why should not nature be appealed to; why should not natural form be conventionalised and adapted instead of ancient forms revived. He confined himself here to architectural foliage carving, and did not claim for it a position above the subordinate one as an accessory to architectural ornament, and therefore subservient to the form of the work itself. When designing foliage, nature should be faithfully and constantly referred to; its endless beautiful forms should be drawn and stored up for future use. Yet these natural forms must in some degree be rendered differently; in other words, they must be conventionalised or altered sufficiently to make them applicable and suitable to the various purposes for which they were designed. No positive rules could be laid down for the manner of doing this. Every age had its own peculiarities, and every people their conventional mode of expression. Experience, too, had taught us that foliage and flowers could not be represented precisely as we saw them in nature. They must be modified according to the material in which they were wrought. For instance, carving in statuary, marble allowed a closer approach to nature than could be the case with coarse sandstone; while the pattern on wall-paper might be a more direct imitation than architectural carving. In carving, we had to study chiefly form and light and shade. In form, we had first to decide upon the most proper laying or setting out of the lines before clothing them with foliage. To avoid monotony it would be advisable to introduce animal form among the foliage, as was often done in mediæval work. The artist should not allow himself to be fettered by the forms in nature, but should work upon broad principles. In art, as in nature, there should be constant variety and change. No two designs in foliage should be precisely alike. Yet wherever Corinthian capitals were chosen for a building the same patterns—accurately taken from some well-known example—were used. This could not be true art. The designs seemed more like work turned out by machinery than by men. He urged artists and architects to strike out into new and independent combinations from nature. Great improvements had been made in carving within the last forty years, but we were still far behind the ancient schools in this class of work. There was a wide field in which we might go far beyond anything done by the Greeks or the Goths. Unfortunately, at present there was a distinct inclination to omit foliage from architectural ornament, or to confine it to a panel or

two with a sunflower. Good foliage carving need not necessarily be dear, and all architects might work together to render it less expensive and more attractive and varied.

The lecture was illustrated by means of numerous diagrams, in which Mr. Colling pointed out the combinations and arrangements of foliage ornaments.

THE CONSTRUCTION OF THEATRES.

A PAPER on "The Construction of Theatres" was read by Mr. Augustus W. Tanner, A.R.I.B.A., at a meeting of the Civil and Mechanical Engineers' Society on the 1st inst. The chair was taken by Mr. Twigg, C.E., President of the Society.

It had been said, Mr. Tanner observed, that theatres were the only important buildings of modern times designed wholly without reference to precedent. This being admitted, the construction of theatres was a subject specially suited for the joint consideration of architects and engineers. A few years ago it was remarked "that foreign theatres are of no possible consequence to Englishmen." An English theatre was nearly always built on a close and confined site. But the architect's difficulties here were increased by want of funds as well as by want of space. On the Continent the State assisted the work, and the site was commonly open and well selected. Audiences there, too, went to a theatre with very different impressions, and it would by no means follow that what was wanted abroad was therefore required here. Admitting this, however, he should, for the sake of touching upon certain general principles of construction, take a rapid glance at the ancient Greek and Roman theatres, and also at some of the principal modern theatres on the Continent. Having touched on points of construction by which the greatest number could be enabled to see the stage and hear well, he quoted M. Garnier, who, when about to erect the Opera House in Paris, having visited most of the theatres of note, found so many different and contradictory acoustic qualities and non-qualities that he came to the conclusion it was impossible to reconcile the numerous theories, and declared the science was yet in its infancy and the result uncertain. Mr. Tanner suggested rather that we lost sight of the science by persistent opposition to its principles. The Greeks knew the principles and built to suit them; we knew them too, but tried to adapt the principles to our buildings. The regulations of the Metropolitan Board of Works had caused a complete revolution in the construction of theatres. It was now more true than ever that the building of a theatre was a pure piece of practical arrangement which the greater portion of the world never saw and did not care to understand. If it was useless before, it was certainly of no use now for any one intrusted with the design of a theatre to spend time and money in running over the Continent to study examples. The artist elated with the importance of his commission must descend from flights of fancy to the study of rules and by-laws. With regard to safety from fire, so long ago as 1790 Saunders made some excellent remarks, which, however, had never been enforced by law. "Theatres," he wrote, "should be surrounded by a thick wall, all round stage and auditorium. Over the curtain an arch may be turned on which the wall may be continued up quite through the roof so as to prevent all connection of the timbers. The passages communicating with the boxes should all be arched, and have an easy access to spacious stone staircases that would in case of fire enable the audience to depart without the least hazard; and though it is necessary to confine the entrances to a few in number, yet there ought to be many large doors hung on the outside ready to be thrown open at the conclusion of the performance, and upon any sudden alarm. Partition walls should be carried quite through the roof in as many places of the building as opportunities afford, and no one would neglect to render it insulated where possible." Had more regard been paid to these words within the last century perhaps fires would have been less destructive, though after recent experiences one might begin to doubt whether any construction could really be devised to offer effectual resistance to the flames. Enlarging upon the suggestions of Saunders, Mr. Tanner described the principal points to be attended to in the internal arrangement, construction, and provision of means of egress for a theatre. A theatre badly built was the worst and most dangerous of all buildings, but except with regard to expense there could be no possible difficulty in making it perfectly safe even with kitchens and smoking-rooms on the premises. With regard to the proposed employment of perforated girders through which water might be poured, to the placing of tanks of water on the roof, and to the use of an iron curtain in the proscenium opening, he remarked subsequently that all our theatre builders agreed in thinking these things of little real service. Experience of the working of such things when the crisis came seemed to show that it was not by special appliances that the safety of the public was to be secured, but by generally sound construction. In illustration of his remarks on principles of construction, he gave a detailed account of the new Pandora Theatre, now being built from the plans of Mr. Thomas Verity, which, he said, would prove to be one of the most remarkable spectacular theatres of the day. The auditorium of this theatre measures

60 feet from the proscenium curtain to the front of the grand tier boxes, and is 60 feet in height from the stall floor to the ceiling. The transverse diameter between the fronts of the dress circle or balcony is 50 feet, and the total width across, between the backs of the circles, is 86 feet. The depth of the stage measures 54 feet, the width of the stage opening is 33 feet, and the height 35 feet. Within the auditorium, at the distance of 13 feet from the enclosing wall, and about 17 feet apart, are placed three tiers of cast-iron columns, and crossing these at every stage are wrought-iron cantilever girders of unique design, which bridge the space from the walls to the columns, and project beyond for the support of the circles to a distance of 12 feet 4½ inches in the centre of the auditorium, gradually lessening to a projection of 4 feet 2 inches from the columns or fulcrums next the proscenium wall. Mr. Tanner explained in detail the construction of these cantilevers, and the scientific way in which strength is added to them over the columns where lies the greatest strain. The construction of the upper portion of the stage was also fully described. The grid-iron floor, the scenery battens and all appurtenances, the wrought-iron roof trusses and roof over centre of stage, the inner walls, and half the roofs of the ballet and super rooms on the level of the gridiron floor are all supported on a vast structure of iron consisting of four heavy cast-iron stanchions, three stages in height. These stanchions are as it were placed in the four corners of a square, measuring 50 feet from north to south, and 37 feet 6 inches across. The long sides are spanned by two immense wrought-iron single-web girders, each weighing 15 tons, and the proscenium opening by a girder about 4 feet deep, weighing 7 tons. These girders had to be hoisted in the form of single plates and angle irons on to a timber staging 50 feet from the ground, and there rivetted and manufactured. The stanchions are enclosed in solid brickwork, and the girders are also protected by brick walling. The whole of the fireproof construction throughout every part of the building has been executed with Messrs. Dennett & Ingle's patent fire-resisting concrete, and the same firm were also the contractors for the constructive ironwork, which was all fixed within four months from the date of order. The large and deep plates and shaped webs for cantilevers had to be specially rolled. Mr. R. M. Ordish, C.E., designed this elaborate construction under the direction of the architect; and through the kindness of the latter gentleman, Mr. Tanner was enabled to illustrate this portion of his paper with a large number of detail drawings. For decorative coverings of parts of the interior Jackson's canvas plaster was to be employed, a fire-resisting material which had stood the test of thirty years' use, while the whole of the wood in the building would be thoroughly saturated with Astrop's cyanite, a new material rendering wood to a certain degree impervious to the effect of fire, inasmuch as though the wood might be consumed it would not support combustion. In further exemplification of the subject, Mr. Tanner gave an epitome of the methods adopted by Mr. C. J. Phipps in theatre building. Among other points advocated was the use of concrete instead of iron for dividing-doors between the several "risks" (to apply an insurance word) in the building. The best form for the auditorium, he was inclined to think, would be a development of that adopted in the *Théâtres Historique and Lyrique* in Paris—an elliptic with its major axis at right angles to the depth of the stage. By this disposition, the whole audience were brought nearer the stage and all might have an equally good view, and for sound this form was excellent.

In a discussion which followed, the chairman said what he wanted in a theatre was to hear, to see, to be comfortable, and to be safe.

Mr. Hebb remarked that the regulations with regard to theatre building issued after the passing of the Act of 1878 were of a tentative character. It was a question whether it should not be forbidden to erect theatres in immediate contiguity to houses. There were theatres in existence which were extremely dangerous in consequence of the approaches being through houses which did not belong to the theatre premises, and where, if a fire occurred, the escape of the audience would be completely cut off. At present the Board of Works had but little control over the selection of a site, and had been almost compelled to agree to the erection of theatres in positions in which they should not have been placed. If public opinion was ripe the Board would be ready to increase the stringency of their regulations.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

An ordinary meeting of this Association was held at Queen's College on Tuesday, January 30, the chair being occupied by Mr. W. H. Kendrick. Mr. J. Jos. Bateman was elected an honorary member. Mr. W. Henman, A.R.I.B.A., read a paper on "Home, sweet Home," and illustrated the subject by scientific experiments and blackboard sketches. A discussion followed, and a vote of thanks, proposed by Mr. F. E. F. Bailey, A.R.I.B.A., seconded by Mr. J. K. James, and supported by Messrs. Gething, Mantle, Scruton, and Cross (hon. sec.), was accorded to the author of the paper.

BUILDING REGULATIONS IN LEICESTER.

A MEMORIAL has been addressed by the Leicester architects to the Town Council in reference to the proposed building regulations. It says:—"The Leicester and Leicestershire Society of Architects having by the favour of the borough authorities lately obtained copies of the proposed new building regulations, and having considered the same so far as the limited time for consideration has permitted, beg to express their appreciation of the clear arrangement and generally excellent spirit of improvement in which the new rules are conceived and drawn up, but at the same time respectfully suggest the reconsideration of some rather important matters of detail shown in the revised copy sent herewith, which appear to be unnecessarily stringent, and likely in some cases to check rather than to regulate the building operations in the borough." The master builders of Leicester have also presented a memorial to the Council, in which they "humbly beg that the portion of the report which purposes to make certain clauses of the Acts of 1881 and 1868 compulsory, which have been hitherto permissive, do not receive your sanction, particularly the clause which makes it compulsory to erect 9-inch division walls in cottage property. Their experience is that the extra cost of such an arrangement will press heavily upon the class who occupy such tenements, and that the arguments in support of such arrangements were not logical or consistent with the facts of the case or the practice of those who advocated them." The memorials have been referred to the Highway Committee.

NEWCASTLE SOCIETY OF ANTIQUARIES.

THE seventieth annual meeting of the Newcastle-on-Tyne Society of Antiquaries was held last week in the Castle, Newcastle, the president (Earl Ravensworth) in the chair, when the following report was read:—"The Society has now arrived at an interesting period of its history. It is proposed, and indeed an agreement to carry out the proposition is drawn, and, with possibly some trifling alterations of detail, will be executed within the next few days, for the purchase of the Black Gate. The council has been induced to take this course for more reasons than one. The Museums Act not having been adopted in Newcastle, the preservation and exhibition of objects of interest depend entirely on the efforts of private societies. The building itself, in its best parts of the time of Henry III., the erector of Westminster Abbey, presents curious features; and, seeing that we know its precise cost, as we do that of the keep, it is of high importance in the history of English architecture. A museum fund will be applied towards the repairs of the tower and adapting it for the reception of such of our collections as require better light than that possible in the keep, but a liberal subscription will be necessary, as the extras and fittings will be expensive. Some discussion has arisen as to the proper summit of the gate. Probably it would, like the towers of the Town Wall, be provided with means for machicolation; but as we really have no evidence upon the point, and as the superstructure is Jacobean, we have all but determined to substitute for the present roof, which falls very well in with the general sky line, a pitched roof covered with flat tiles somewhat like those which form such a characteristic and pleasing feature in certain churches at York. While the non-adoption of the Museums Act in so large a town must be regretted, we are bound to state that the terms of the Corporation are liberal and acceptable. It is satisfactory to be informed that new light, or a refreshment of old light is to be poured upon the history of Newcastle. The new part of our transactions contains some particularly interesting papers, and the Society's "Northumbrian Minstrelsy," has received much attention. With respect to the Lapidarium, search is being made for all the inscriptions that have been found since the date of the last publication. Most of those discovered have been sketched, and wood engravings representing them are being prepared by Mr. Utting, under the supervision of Dr. Bruce and Mr. Blair. Measures also are being taken for the enumeration and perpetuation of the ancient buildings of Newcastle. The growth in number and worth of local topographical works is very encouraging. Mr. Philipson's excellent book on harness is of a general character, but it most appropriately proceeds from those Border lands where the owners had to find horses and armour. Drayton records their blazon as "the snaffle, spur, and spear." We have caused an interesting exploration of North Gosforth Chapel to be made, and were in hopes that the operations of the Corporation would have thrown some light on the course of the Roman Wall. But beyond the occurrence of Roman pottery no evidences as to the Roman period cropped up. The honorary secretaries, while intending to continue to take a lively interest in the Society, consider that their resignation and the appointment of successors are desirable.

The financial statement showed that there was a balance in hand from 1881 of 623*l.* 0*s.* 6*d.*; subscriptions, 117*l.* 12*s.*; collected at the Castle, 85*l.* 4*s.*; and other items made a total of 858*l.* 7*s.* The expenditure amounted to 334*l.* 11*s.* 5*d.*, and there is in hand a balance of 513*l.* 15*s.* 7*d.*

Mr. Hodgkin said the society had undertaken to become tenants of the Black Gate on the understanding that 1,000*l.*, more or less, be expended in restoring the building. The committee consulted with Mr. R. J. Johnson, who had prepared plans for altering the Black Gate and making it suitable for a museum; there could be three rooms, each 40 feet long by 20 feet broad. The committee had received a tender from Mr. Burton to do the work for 1,300*l.*, and he moved that the tender be accepted. The furniture, &c., would cost about 300*l.* more, making 1,600*l.*; and towards that the society had a sum of 1,000*l.* The balance of 500*l.* on the ordinary account of the society could not be appropriated to heating purposes.

The motion for the acceptance of the tender was agreed to, and the Black Gate Committee was reappointed.

THE ARTISTS' VOLUNTEER CORPS.

ON Saturday evening, at the Criterion, Lieut.-Colonel Sir Frederick Leighton, P.R.A., distributed the prizes to the successful members of the 20th Middlesex Rifle Volunteers. In the course of his remarks, he alluded to the recent changes in the staff of the regiment. He regretted the retirement of Major Busk, who had served many years, and who resigned on account of pressing and increasing business engagements. Captain Elmhirst, who had been acting adjutant for the last two years, had also retired from the service. Captain Haggard, late of the Royal Irish Rifles (86th Regiment), had been appointed his successor. Sir F. Leighton said he wished to contradict a rumour as to the financial condition of the corps. That condition was sound and satisfactory, inasmuch as they had a balance at their bankers. The amount of capitation grant earned from the Government was 1,365*l.* 10*s.*, the largest sum they had ever earned. There were 69 proficient officers and sergeants and 774 efficient. The recruits who had joined since November 1 numbered 94, the percentage of efficiency was 98.72, and the strength of the regiment 798, as against 771 last year. There had been a falling off in the number of marksmen. There were only 78 this year, while in 1881 there were 99. As to the shooting he must impress upon the members of the battalion the importance of firing their class early in the year, not delaying until the showery days of autumn. The late war in Egypt showed them how necessary it was for troops to shoot well. Armed, as was the battalion, with good rifles, and seeing that the members were young, intelligent, and well-educated men, there could be no excuse for indifferent shooting. The weather had been against them last year, and the range at Park had been closed for six weeks. Arrangements had now been made for separating the battalion shooting from the shooting done by the different companies. The prizes were then distributed, and the members afterwards dined together. Among the guests were the Duke of Teck and General Higginson.

GAS AS A HEATING AGENT.

A MEETING of the Manchester Section of the Society of Chemical Industry was held on Monday last, when a paper on "The Use of Gas as a Heating Agent compared with Solid and Liquid Fuel" was read by Mr. G. E. Davis, Government Inspector of Alkali Works. The author recommended the use of coke for house fires. If cooking could not be done well with this fuel, gas should be used sparingly. Manufacturers might also fire with coke, or if coal was still considered desirable a mechanical stoker should be employed. A ton of dry coke had the same heating nature as a ton of ordinary dry Lancashire coal when properly burned, and in many instances, owing to its freedom from volatile matters, it could be used in such a manner as to do far more work, weight for weight. Coke recommended itself to the householder as well as to the manufacturer, and if means were only found for its continual production in a suitable form for use in domestic grates a new era of fairly smokeless cities would quickly commence. It would be well for us to remember that when we burned coal at 10*s.* per ton we got 65 unit-tons of heat for one penny; while when coke was burned the number of unit-tons of heat for the same money was 84, reckoning coke at 7*s.* 6*d.* per ton. Heating in any ordinary way by gas, dwelling-rooms for instance, was entirely out of the question until gas was reduced far below its present price. Even at half that now charged gas-heating would be considerably dearer than coal; and from his own experiments, burning gas in the best manner and coal in the usual reckless mode we were all so fond of, the heating values would only be equal with gas at 10*d.* per 1,000 cubic feet. To look the matter fairly in the face, the lowest price at which gas was put into the mains was in London, where it was said to cost 13*d.* per 1,000 feet; at one of the works of the Manchester Corporation it cost 14*d.* per 1,000, so that coal-gas for purposes of the continuous warming of rooms, heating of steam boilers, &c., could not be expected to compete successfully with coal for a long time to come. Though gas-cooking had its advantages, the high price now charged for gas showed practically no pecuniary benefit, and it

was certain that the price of gas must be much reduced in order to tempt people to consume it. There was no reason why its price should not be reduced at once to 1*s.* 6*d.* per 1,000 cubic feet, and if the manufacture was not a monopoly it would have been below this price long since. All gas stoves should be provided with means for carrying the products of combustion into the outside air. We should no more allow the products of combustion to pass out into the atmosphere of our rooms than we would allow a coal fire to burn in our dwellings without a chimney. It was very well to hear of stoves which consumed their own smoke or condensed all their products, but in any ordinary method of combustion such things were next to impossible. Wherever there was gas burned there must be good ventilation to carry away the products, and when he had seen small bath-rooms and kitchens heated by gas, with gas for cooking, and also water-heaters in use in confined places without chimneys, he had never marvelled at the complaints of headaches from the occupants, but he had wondered that the so-called "accidents" had not been more frequent. Every gas stove, whether used for heating or cooking, should be connected with a chimney, or with the outside air, in order to carry away the sulphurous and carbonic acids. No stove should be allowed in any dwelling-house except under these conditions. It should be universally known that the chief product of the combustion of gas is carbonic acid, a non-supporter of combustion or life; and when present in very small quantities in the air we breathe had a decided effect upon the living organism. It was essential, then, that this gas be eliminated from our rooms as fast as it is formed. The other impurity arose from the presence of sulphur compounds in the gas, which could easily be removed at a moderate cost. These sulphur compounds burned into sulphuric acid, commonly called oil of vitriol, and as such found their way into the articles of furniture, binding of books, brasswork, &c.

Garlands Asylum, Carlisle.

SIR,—I observe a paragraph with the above heading in your issue of February 3, with a description of certain large additions which have recently been completed under the direction of Mr. Corry, architect and county surveyor, Carlisle, and stating that "the plans from the beginning of the asylum, some twenty-five years ago, have all been prepared by Mr. Corry."

Without in any way wishing to detract from the part that gentleman has had in carrying out the building, I feel it due to myself to state that the original design was prepared by myself, selected in an open competition, for which I was paid the first premium of 300*l.* This was the first asylum planned on the block system, and I received from my friend Mr. Samuel Gaskell, who was at that time the most active of the Lunacy Commissioners, valuable assistance and advice in the general disposition of the buildings so as to admit of a large future extension. The Lunacy Commissioners subsequently requested me to allow the plans, as illustrating a principle, to be published in their annual report. The Magistrates, unfortunately for me, reserved to themselves the right to retain the drawings and carry them out in their own way; and, availing themselves of this condition, I was obliged to submit to the hardship of losing a very valuable commission which I thought I had fairly won.

So many years have elapsed that the circumstances had quite passed from my recollection until reminded of them by the paragraph alluded to.

I am, sir, yours faithfully,
110 King Street, Manchester. THOS. WORTHINGTON.
Feb. 6, 1883.

NOTES ON NOVELTIES.

Vyle's Patent Lightning Conductor.—An increased interest is taken by the profession in lightning conductors. Owing to the improvements that have of late years been made in them by different manufacturers, coupled with (in most instances) a great reduction in price, there is scarcely a new villa residence with any approach to respectability now considered complete without one of these necessary safeguards. The attention to conductors has been increased considerably since the publication of the report of the committee appointed to investigate the subject. The report states that the mere presence of a lightning conductor against a building is not always sufficient to guard against the risks attendant upon an atmosphere highly charged with electricity, but that a certain amount of supervision is necessary to secure their perfect efficiency. For instance, the earth in which it is embedded may, after a time, become dry, when its action may become inoperative, and tests become necessary at intervals. Hitherto the great difficulty experienced by electrical engineers has been to carry an electric

current to the terminals of the copper rods or tapes, which are sometimes fixed in positions where they cannot well be reached. To remove this difficulty and expense, Messrs. Dixon, Corbitt & Spencer, of Commercial Road East, and Gateshead-on-Tyne, have recently introduced an improvement, the patent of Mr. Vyle, which appears to answer its purpose remarkably well, and nothing but gross negligence should now endanger security where one of their new conductors is fixed. The improvement consists in inserting a copper wire inside the cable, and passing from the bottom to the terminal through the core. At the top this wire is laid bare and soldered to the outer copper wires, over which the copper terminal is fixed. At the foot of the stack or building a small testing-box is fixed, inside which the strands are opened, and the wire in question again laid bare, and connected to terminal screws. The insulated wire is also connected to the earth terminals, and so forms two circuits. All that is required to conduct a test is to open the test-box and connect a Lechauché battery and bell to the terminal screws; and, if the conductor is perfect, the circuit will be completed to the top of the conductor and again to the earth, which is known by the bell ringing. The value of the invention was recently acknowledged at the Tynemouth Exhibition, by a silver medal being awarded to the firm. The "Easily tested" lightning conductor is the name applied to it by the makers, and it does not belie its appellation.

LEGAL.

Court of Session, Edinburgh.

(Before Lord KINNEAR.)

DUNNACHIE AND OTHERS v. YOUNG & SONS.

GLENBOIG FIRE-CLAY GOODS.

On the 5th inst. judgment was given in this case, which is important from its connection with the use of certain trade-marks.

The complainers—James Dunnachie, Star Fire-brick Works, Glenboig, near Coatbridge; and the Glenboig Fire-clay Company, Glenboig, asked the Court to interdict the respondents, John Young & Sons, sewage pipe and fire-brick manufacturers, Heathfield and Cardowan, Lanarkshire, from selling, shipping, or exporting any fire-clay goods, stamped with the word "Glenboig," other than fire-clay goods manufactured by the complainers. They said that the whole of the Glenboig seam was co-extensive with the Glenboig farm only; was of a superior quality and specially valuable in the market, and belonged to and was worked by them; and, also, that the respondents had recently been making and selling their goods under the name of Glenboig goods, fraudulently, and with the view and effect of deceiving purchasers and the public, and inducing them to believe that the goods were made of the complainers' or Glenboig clay. In answer, the respondents said that they owned and worked clay of the Glenboig seam, that the clay derived from this seam was identical in quality through its whole extent, extending beyond the Glenboig farm; that the goods made from it were known in the trade as Glenboig goods, by whomsoever made, and the term was not confined to goods made by the complainers. Also, they said, the fact that they made goods from the Glenboig seam and sold them as Glenboig goods had long been known by the trade and the public, and had, moreover, long been known and recognised and acquiesced in by the complainers themselves. It was, they added, in accordance with the usage and custom of trade, well known to and recognised by the complainers and respondents and all those having dealings in fire-clay goods, that all goods manufactured from a particular seam of clay should be so described, no matter by whom they were made.

The Lord Ordinary said that there were two things which the interdict was intended to strike at—first, the imitation of the trade-mark of both or either of the complainers; and, second, the use of the name "Glenboig" at all, not merely as a trade-mark in the proper sense—that was, as a distinctive mark impressed upon respondents' goods, or affixed as a distinctive word in catalogues, advertisements, or in any other way to designate goods manufactured and sold by them, and that irrespective altogether of the meaning that they may take to inform their customers or the public that they are not goods manufactured by either of the complainers. The second of these claims was pressed by the Solicitor-General, who stated that certain circulars and advertisements which the respondents had been in the habit of issuing for many years without complaint could not have been effectively challenged although they fell within the terms of the interdict now asked. His Lordship did not now understand it to be maintained that the complainers had acquired such an absolute and exclusive right in the use of the word Glenboig that they were entitled to prevent another manufacturer employing it as a distinctive of fire-clay goods which were not themselves marked with it, even though he did so in a way neither calculated nor intended to deceive. Nor was it intelligible that such an exclusive right to the use of a distinctive name should be vested at the same time in two independent and competing manufacturers. The question requiring consideration, therefore, appeared to his Lordship to be whether the complainers were entitled to interdict in the terms

asked against the use of the word "Glenboig" by the respondents as a trade-mark, or against his use of that word in combination with another word or words, because it was perfectly clear that the use of the word "Glenboig" by itself would be a direct invasion of the Glenboig Company's right. The two complainers are tenants of portions of a bed of clay lying under the lands of Glenboig, and each of them has works situated upon the lands. Their averment, and it was entirely borne out by the evidence, was that the clay on the Glenboig farm possessed many exceptional qualities, and was described as possessing to a larger extent than other fire-clays the power of resisting heat at high temperatures, and in particular that the goods made from it are free from the risk of cracking after being subjected to an extreme heat. This was a most valuable quality in fire-clay goods. And then the complainers went on to say that the goods manufactured by them had acquired a favourable reputation in districts where they were used, as Glenboig goods. Each of the complainers is the registered proprietor of a trade-mark which they impress upon the goods manufactured by them. The Glenboig Company's mark consisted of the word "Glenboig" alone, while Messrs. Dunnachie's mark is a device consisting of the words "Star Works, Glenboig," with a star and the initials "J. D." between these two letters. The complainers said, and they quite clearly proved, that these two words, "Glenboig" and "Glenboig Star," had established a reputation for excellence, and commanded a high price both in the home and foreign markets. There could be no doubt that complainers' goods were in great demand, and had a fair reputation both in this country and on the continent, and that reputation, which was proved to be well merited, was of great commercial value. There could be as little doubt that this high reputation was attributable not to any peculiarity or special excellence in the manufacture, but to the distinct qualities of the Glenboig clay. It was not disputed that the complainers are excellent manufacturers, and that they would not have acquired a reputation for their fire-clay goods had they not been well and carefully made; but at the same time there was nothing exceptional in their process, and if the same material had been wrought by another competent manufacturer his goods must have obtained the same currency and demand as those of the complainers. Without going into details, His Lordship was of opinion that the respondents, who are the lessees of a fire-clay field in the immediate neighbourhood of the complainers, began about eight years ago to work a seam identically good in quality to the seams worked by the complainers. It was, in his opinion, perfectly immaterial to consider whether there was uninterrupted continuity of strata between the mineral field worked by complainers and the mineral field worked by the respondents. For all practical purposes they were working the same seam, and His Lordship thought it had been proved that before the respondents reached that seam it was known among engineers and fire-clay manufacturers to extend beyond the limits of the area leased by the complainers, and that both within and beyond that area it was known by the name of Glenboig clay, and by no other name. Now it appeared to His Lordship that as soon as the respondents had reached Glenboig clay, and had begun to work it, they were entitled to take advantage, not of the complainers' reputation as manufacturers, but of the reputation of the valuable raw material which they had acquired, and accordingly it was hardly disputed in argument that they were justified in issuing circulars in 1874 stating that they were engaged sinking a pit to the fire-clay known as the Glenboig seam. From that time downwards they had constantly advertised in various forms that they were manufacturing bricks from the clay known as Glenboig. That had been done without challenge from any of the complainers. Assuming these proceedings to be within the respondents' rights, it was of course clear that they were not entitled to imitate the trade-mark of the complainers or in any other way to represent that the goods they sold were goods manufactured by the complainers. The complaint was that the respondents proposed to brand their bricks with the words "Young's Glenboig," and this was said to be a mere colourable imitation of the trade-marks of the complainers. But neither of the complainers, in His Lordship's opinion, was in a position to maintain that the use of the word "Glenboig," although accompanied by a distinct variation, was in itself an infringement of his trade-mark, because each of them as against the other had a right to the use of that word. They were competing against each other in the home and foreign markets, which conceded a right which in this action they both denied to the respondents. The only question, therefore, appeared to be whether the variation which had been adopted by the respondents was sufficiently distinctive. In His Lordship's opinion the brand "Young's Glenboig" was just as distinguishable from Mr. Hurl's "Glenboig" and Mr. Dunnachie's "Star Glenboig" as either of these was from the other. There had been a great deal of evidence on this point, but it had been entirely in accordance with the conclusion that His Lordship had arrived at, that the brand "Young's Glenboig" could deceive nobody. But it had been said that in Russia and Germany it would be different. If it were so it might be a question how far that which was otherwise an ordinary *bona-fide* trade-mark, used by a trader in this country, and unimpeachable here, could be prohibited and interdicted, merely because it was liable to lead to

misapprehension in particular markets. There was no authority, so far as he knew, for that proposition. The marks being names or words in the English language, they would be quite distinguishable wherever the words could be read and understood. On the whole, His Lordship was of opinion that the interim interdict formerly granted must be recalled, and the note of suspension refused, with expenses to the respondents.

ART WORKMANSHIP.

Reredos, Milford Church.—A reredos, executed in alabaster, various coloured marbles, and stone, has recently been erected in the chancel of Milford Church, near Lymington; and other works have also been carried out, consisting of new oak stalls and choir desks, oak ceiling, Poole tile paving, red Mansfield stone steps to sacarium, polished Irish red marble steps to altar platform, and encaustic tile paving to sacarium. The reredos and steps have been executed by Mr. W. Earp, of London; the paving in sacarium by Mr. Godwin, of Lugwardine; and the remainder by Mr. Tilley, a local builder, the whole being carried out from the designs by Messrs. John Colson, F.R.I.B.A., & Son, architects, of Winchester. The reredos and work in sacarium are the gift of a parishioner, the cost of the remainder being defrayed by private subscription through the vicar, the Right Rev. Bishop MacDougall. Figures of the four Evangelists, executed in glass mosaics, by Mr. Powell, of London, are inserted in the panels of the reredos.

ART SCHOOLS.

Chiswick.—On Tuesday evening there was a crowded conversation in the new Art Schools at Bedford Park, when the additions were opened. The schools were established about a year ago, but the accommodation was found to be inadequate for the numerous classes, all of which are well attended. The plans for the new rooms were prepared by Mr. E. S. Burchett, one of the directors of the school, and present several novel features. The upper room is lighted in an ingenious way from above, the roof being carried by curved iron girders, which are continued downwards and by a skilful arrangement form ties for the floor. There are no columns, and the entire area is available. This class-room is probably the best of its kind in London. At the meeting on Tuesday a short address was delivered by Mr. W. B. Richmond, in which he again repeated his advice that figure subjects should express sudden action instead of the rigid postures adopted by models. He also congratulated the school on the possession of an unrivalled collection of casts from the noblest works of Greek and Renaissance sculptors. The casts had been selected with admirable judgment by the directors of the school, and a study of them would insure that catholicity of taste which was so much needed in our times. Mr. Richmond said that in consequence of his resignation of the Slade professorship at Oxford he had a little more time at his disposal, which he would gladly utilise for the benefit of the students of the Chiswick School. The class-rooms contained many pictures, drawings, and etchings which were lent for the occasion.

CHURCH BUILDING AND RESTORATION.

Hatfield Heath.—The Church of Holy Trinity has been reopened after extension, in the course of which an aisle and transept has been added on the south side. Owing to the discovery of extensive dry rot in the wooden flooring of the church, new flooring has had to be put down. Mr. G. E. Pritchett, F.S.A., of Bishop Stortford and London, is the architect, and Messrs. Rattee & Kett, of Cambridge, are the builders.

Coggeshall.—A Wesleyan chapel has been opened in Meeting Street. On the adoption of plans by Mr. S. W. Horton, of East Grinstead, tenders were invited, and that of Messrs. M. A. Gardner & Son, amounting to 785*l.*, was accepted. The building is in the Gothic style of architecture, and will accommodate over 200 persons, its proportions being 50 feet by 27 feet.

Gayton.—The parish church has been reopened after restoration. The work has been carried out from the plans of Mr. Matthew Holding, architect, of Northampton, by Messrs. Edmund Roberts & Son, builders, of Weedon.

Byford.—The parish church of Byford has been reopened after undergoing restoration. The work has been carried out by Messrs. Beavan & Hodges, builders, of Hereford, under the direction of Mr. Lewis Powell, architect, Hereford.

Shirley.—St. James's Church has been reopened lately, after enlargement. The additions have been carried out by Messrs. Bragg Bros., builders, of Solihull, from the designs of Mr. John Cotton, of Birmingham.

Durham.—Alterations are being carried out at Washington Church to enlarge the building. The contractor for the work is Mr. Sanderson, of Durham. Messrs. Austin, Johnson, & Hicks, of Newcastle-on-Tyne, are the architects.

Clopton.—The foundation-stone of a new chancel to Clopton Church has been laid. The architect is Mr. Herbert Green, of Norwich, and the contractor, Mr. R. Tooley.

Houghton-le-Spring.—The foundation-stone of a new church, to serve as a chapel of ease to the parish church, has been laid. The building is being erected from the designs of Mr. Hodgson Fowler, of Durham, by Mr. Elstob and Mr. Tremble, contractors.

Nottingham.—A site for a Methodist New Connexion Church has been secured at the junction of Mansfield Road and Redcliffe Road, Nottingham, and Mr. A. H. Goodall, architect of that town, has received instructions to prepare drawings for a building to cost from 4,000*l.* to 5,000*l.*

SCHOOL BUILDINGS.

Dorchester.—The Grammar School at Dorchester has been opened. The building is in Upwey or Bincombe stone in random courses, chopped-in face, pointed in dark mortar; the dressings are of Doulton stone, and the roof is covered with tiles. The style is the early part of the seventeenth century, and in extent the buildings cover 570 superficial yards. The architect is Mr. George Crickmay, of Weymouth, and the work has been executed since July, 1881, by Messrs. Davis & Son, of Dorchester, within the amount of the original estimate of the architect, at a cost of about 5,000*l.*

Nottingham.—The People's College, Nottingham, has been opened as a higher grade Board School. The school consists of two buildings, one facing College Street, and the other block facing Ropewalk Street. One of these is designed for the boys, and the other for the girls and the junior scholars. The front elevation is in College Street. The architects were Messrs. Evans & Jolly, of Eldon Chambers, Wheeler Gate, Nottingham, under whom the alterations have been carried out. The tower which formed the staircase, and stood in the centre of the College Street front, has been taken down, all the internal walls have been taken out, and four class-rooms formed in each storey. Each class-room is arranged to hold sixty scholars, and the building now provides accommodation for 480 scholars.

Portsmouth.—New Board Schools have been opened in Binstead Road, Buckland. The buildings have been erected from the designs of the architect, Mr. A. H. Bone, to accommodate 915 children—boys, girls, and infants. The style is plain Gothic, the facings being of deep coloured red brick, relieved with Beer stone dressings from the Beer stone quarries in Devonshire. A caretaker's residence, detached from the schools, and large open playgrounds, are provided. The contractor was Mr. John Crook, of Northam, near Southampton, the cost being a little over 8,000*l.* The gasfitting and water supply was done by Mr. H. B. Kent, of High Street, Southampton. Mr. Walmesley was the clerk of works.

Birmingham.—The foundation-stone has been laid of St. Chad's Roman Catholic Schools. The building is designed in Gothic style, and is to accommodate 700 children. Mr. G. H. Cox is the architect, and Mr. Thos. Robotham the builder.

Birkenhead.—The foundation-stone of new schools in Mersey Road, Lower Tranmere, has been laid. The architects of the building are Messrs. T. C. Clarke & Alexander Bleakley, jun. The total cost, with land and fittings, will be about 4*l.* 2*s.* 6*d.* per child.

GENERAL.

The Dundee Art Exhibition this year has realised a sum of 6,723*l.* by sales of paintings, &c., being an increase of 1,309*l.* over previous years' sales.

A Ruskin Society is proposed to be established in Liverpool.

A Stained Glass Window has been erected in St. Augustine's Church, Wrangthorn, as a memorial of the late Mr. John Fraser, C.E.

Plans for a Roman Catholic church at Carlton have been prepared by Mr. Whitbread.

A School of Art is to be erected at Lincoln at an estimated cost of between 4,000*l.* and 5,000*l.*

The Archæological Section of the Birmingham and Midland Institute have secured the wainscotting, doors, chimney-piece, &c., of one of the rooms in the house of Mr. Hector, in the Old Square, Birmingham, wherein Dr. Johnson was a frequent guest. These relics are to be transferred to Aston Hall.

Sanday Pier, Kirkwall, is to be extended 230 feet seawards, and a tender of 3,250*l.* on the part of Messrs. Drever & Robertson, of Stromness, has been accepted for the work.

A proposition for the erection of model dwellings in the parish of St. Botolph Without is under consideration of the trustees of the parish charity funds.

A Marble Reredos, designed by Mr. J. P. St. Aubyn, has been erected in Tucking Mill parish church, Cornwall.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, FEBRUARY 10, 1883.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*** Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—
"Contract Supplement to THE ARCHITECT."*

COMPETITIONS OPEN.

HUNTLY.—Feb. 15.—Plans are required for Erection of a Library. Mr. Robert Sellar, Aldie House, Huntly.

NOTTINGHAM.—March 15.—Plans, Designs, and Estimates are invited by the Corporation for the Erection of Municipal Offices. Premiums to the extent of 600*l.* offered. Mr. S. G. Johnson, Town Clerk, Municipal Offices, Nottingham.

WALSALL.—March 1.—Plans and Specifications are invited for the Erection of Schools with Class-rooms and Outbuildings to accommodate 850 Children. Mr. G. Cotterell, Clerk to the School Board, Walsall.

CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—Feb. 12.—For Building Eleven Houses and One Shop. Messrs. J. D. & J. Lindley, Architects, Ashton-under-Lyne.

BALSALL HEATH.—Feb. 21.—For Providing and Laying Sewers, Storm Water Drains, with Manholes, Ventilators, &c. Mr. Sam. Owen, Engineer, Public Office, Lime Grove, Mossely Road, Balsall Heath.

BEVERLEY.—Feb. 16.—For Enlargement of Dining Hall East Riding Asylum. Messrs. Smith & Brodrick, Architects, Cogan Chambers, Hull.

BIRKENHEAD.—Feb. 21.—For Construction of Retort House, Purifier House, &c. Mr. H. Ashtoa Hill, Engineer, Gasworks, Great Float, near Birkenhead.

BIRSTAL.—Feb. 12.—For Work in Laying-out White Swan Estate for Building on. Mr. W. Hanstock, Architect, Branch Road, Batley.

BOSTON.—Feb. 21.—For Construction of Engine, Boiler, and Accumulator Houses and Brick Chimney. Mr. W. H. Wheeler, C.E., Market Place, Boston, Lincolnshire.

BRENTFORD.—Feb. 20.—For Additions to Passenger Station. Plans at the Engineer's Office, Paddington Station.

BRIDLINGTON.—Feb. 19.—For Building Wesleyan Chapel, School, and Eight Class-rooms. Mr. J. Earnshaw, Architect, Wellington Road, Bridlington Quay.

BRIGHOUSE.—Feb. 20.—For Erection of Scotch Room, Engine House, Warehouse Staircase, Offices, and Premises. Messrs. G. Hepworth & Son, Architects, Brighouse.

CARMARTHEN.—Feb. 12.—For Building Board School, Quay Street. Mr. T. Walters, Solicitor, 1 St. Mary Street, Carmarthen.

CLONMEL.—Feb. 19.—For Building Two Mortuary Chapels, Gate Lodge, and Entrance Gates at the new Cemetery. Mr. Walter G. Doolin, B.E., Architect, 20 Ely Place, Dublin.

CORK.—Feb. 15.—For Erection of Buildings for the Exhibition, 1883. Mr. Robert Walker, C.E., Architect, 17 South Mall, Cork.

CUTHBORPE.—Feb. 20.—For Building Schools to accommodate 250 Children. Mr. John Gould, Architect, 15 Packer's Row, Chesterfield.

DALTON-IN-FURNESS.—Feb. 15.—For Rebuilding St. Mary's Church. Messrs. Paley & Austin, Architects, Church Street, Barrow-in-Furness.

DEPTFORD.—Feb. 15.—For Widening Superstructure of Deptford Creek Bridge and providing temporary Bridge Mr. J. E. Wakfield, Metropolitan Board of Works, Spring Gardens, S.W.

DOVER.—Mar. 5.—For Building Warehouse and Extension of existing Warehouse on Clarence Quay. Mr. Rowland Rees, Harbour Engineer, Dover.

DRUMMOND.—Feb. 13.—For Building an Orphanage. Messrs. Matthews & Lawrie, Architects, 2 Church Street, Inverness.

ELWORTH.—For Building Brick Warehouse, &c. (Four Storeys and Cellars.) Messrs. J. Pring & Son, Wire Works, Elworth, Sandbach.

FAWLEY.—Feb. 10.—For Building Room, Forming Playground, and other Works to Board School. Mr. D. Davy, Cadland, Southampton.

FLIMBY.—Feb. 10.—For Alterations and Additions to Vicarage. Mr. W. C. Jennings, Architect, 72 Main Street, Cockermouth.

FULFORD.—Feb. 14.—For Building Dwelling-house in Church Lane. Mr. Beaumont, Architect, Freshfield Cottage, Fishergate, York.

GATESHEAD.—Feb. 10.—For Rebuilding High Teams County Bridge. The County Surveyor, Shire Hall, Durham.

GLASGOW.—Feb. 16.—For Executing the Digger-work in connection with the New Municipal Buildings. Mr. Carrick, City Architect's Office, 74 Hutcheson Street, Glasgow.

GODSTONE.—For Building Two Cottage Residences and Stabling. Mr. W. E. McCarthy, Architect, 20 Cockspur Street, S.W.

GRANTOWN.—Feb. 10.—For Building Villa. Messrs. A. & W. Reid, Architects, Elgin.

GREAT YARMOUTH.—Feb. 12.—For Building Warehouse, Pickling Vats, and other Works. Mr. Charles G. Baker, Architect, St. George's Plain, Great Yarmouth.

HALIFAX.—Feb. 23.—For Building Mill, Engine-house, Boiler-house, and Chimney, Clay House Estate. Mr. Richard Horsfall, Architect, Post Office Buildings, Halifax.

HEREFORD.—Feb. 13.—For Alterations at Cattle Market Tavern, and other Works. Mr. J. Parker, City Surveyor, Hereford.

HERTFORD.—Feb. 19.—For Erection of Barrack Buildings and Quarters, comprising Twenty-two Residences. Messrs. Smith & Austin, C.E., Hertford, Herts.

HOLYWELL.—Feb. 20.—For Building School Chapel and Vagrants' Wards at the Workhouse. Mr. John Douglas, Architect, 6 Abbey Square, Chester.

WILLIAM PIPE,
Quantity and Measuring SURVEYOR,
Has REMOVED from Old Towcester Road.
His Address in future will be 14 NASSAU ROAD,
St. Ann's Road, Tottenham, Middlesex,
and NORTHAMPTON.

TO ARCHITECTS.—Permanent Appointment.
—Advertiser wishes to engage the services of a Gentleman to
Superintend a Professional and Decorative Business. He must be
a competent Architect and Designer, and able to show that he has
made a study of internal decoration and domestic matters.—
Applicants to state age, remuneration, and past experience to
T. H. P. DENNIS, Chelmsford.

TRAVELLER REQUIRED, to represent a
Terra-Cotta Firm in London and Country. Good address,
energy, and experience in building work required; experience in
an architect's office desirable. Salary and commission. First-
class references required.—State these, and qualifications, also
salary required, in application (by letter) to T. R., 49, Messrs
Deacon's, 151 Leadenhall Street, E.C.

MARBLE, GRANITE MERCHANTS, and
MASONRY.—Wanted, ENGAGEMENT as Manager, Clerk
or Traveller. Well versed in Correspondence. Estimating,
Drawing, &c. Eight years last place. Good connection. Would
take an AGENCY on moderate salary and commission.—
Address T. N. W., 4 Fynes Street, Vincent Square, S.W.

TO TERRA-COTTA MANUFACTURERS.—
Modeller, Draughtsman, and Designer (experienced) requires
an ENGAGEMENT. Temporary or otherwise. Photographs of
work executed, both of sculptural and ornamental architecture,
can be sent for inspection. Excellent references.—Address A. B.,
55 King Street, Leicester.

WANTED.—A thoroughly competent Manager
for a Linoleum Manufactory in Germany. None need
apply who have not had experience in a similar capacity and can-
not produce satisfactory references.—Apply, with testimonials
and statement of salary expected, to "LINOLEUM," care of
British Consulate-Gen., Berlin.

VENTILATION!

THE SANITARY ENGINEERING AND
VENTILATION COMPANY

UNDERTAKE
VENTILATION WORK
OF EVERY DESCRIPTION.
Employing Skilled Workmen under Efficient
Supervision and the most perfect Appliances.

Address—Mr. H. CARTER, C.E.,
115 Victoria Street, Westminster, S.W.

DRY CORSHAM
AND
DRY FARLEIGH
FOR
WINTER USE.
PICTOR & SONS, Box, Wilts.

YOCKNEY & CO., Quarry Owners.
Prices quoted on application for Delivery at any Port or
Railway Station, for all varieties of
BATH STONE, { Selected specially to suit Architects'
Specification and Builders' use.

Address—YOCKNEY & CO., Corsham Down Quarry, Wilts.
CHIMNEYPIECES, TILES, STOVES, &c.
Large Selection. Good Designs. Moderate Prices. Architects
and Builders invited to send their Clients to inspect.
WILKINS & SONS,
88-92 Pentonville Road, N.

"PLUTONIC" CEMENT.

Invaluable for Furnace and Oven Work, which is ready for use
the instant of completion, or for repairs without lowering the
temperature. See "PLUTONIC" CEMENT and its Applica-
tions. Third Edition free by post from the sole manufacturer,

WILLIAM RICHARDSON,
GAS ENGINEER,
Charles Henry Street, Birmingham.

BILLIARD TABLE MAKER AND CONTRACTOR
To Her Majesty's WAR DEPARTMENT.
To Her Majesty's FORCES.

JOHN O'BRIEN,
PRACTICAL BILLIARD TABLE MANUFACTURER,
AND BILLIARD ROOM FURNISHER,
KING STREET WEST, MANCHESTER,
AND 3 LONG ACRE, LONDON.

Sole Maker of the Improved Fast Billiard Cushion that will
never go hard.
Shipper and the Trade supplied. The Largest Stock in the
Kingdom to choose from.

BEST & SAFEST VENTILATOR IN THE WORLD.

This FANLIGHT OPENER is pro-
nounced simply perfect. It ad-
justs ventilators to a nicety, while
its perfect screw arrangements
render accidents impossible. Al-
ready thousands are in use, giving
the greatest satisfaction, in
Religious Institutions, Offices,
Banks, Vestry and Public Halls,
Theatres, Hospitals, Museums,
Hotels, Clubs, Restaurants, Public
Houses, Mansions and other Resi-
dences, Schools, Shops, &c.

Are applicable to every descrip-
tion of Fanlight, opening in or
out, hung upon hinges or on
centres. Also to open any num-
ber simultaneously, such as
lantern, conservatory, and sky-
lights.

The Architect.

ART IN THE HANDS OF THE PUBLIC.

SO many handy books are now being written, and handy discourses delivered, on the pleasant subject of art in the hands of the public, that almost everybody who is possessed of average intelligence must be beginning to understand it. We ought perhaps to add that so many pretty shops are displaying so many pretty wares to the same end, that the very passer-by, even if he be scarcely possessed of average intelligence, cannot help seeing reform in the air. We may say also that, as the necessary result of all this, there are so many houses all over the country amongst which the contents of such shops are being every day most prettily distributed, and whose masters, and especially mistresses, are every day exercising their minds in the direction of prettiness, that it seems as if there must already be enough of commonplace art in actual operation, and all in the most practical way, to make the typical English home already very different from what it used to be.

Mr. R. W. EDIS is one of those authorities who are able at any time to discourse pleasantly, and none the less pleasantly in his case because forcibly, upon the subject of household art in particular; and the report of a lecture of his which we had the satisfaction of printing a little time ago* was certainly very agreeable reading. That it was a more than ordinarily sensible discourse of its kind is evidenced, amongst other things, by his irreverent treatment of the "æsthetic" kind of "art in the house" which just now disturbs so many minds, and in a small way upsets so many tempers. The characteristics of this spurious art are, as Mr. EDIS puts the case, "washed-out and ugly colouring and ill-drawn and utterly inartistic ornament," "washed-out colours in curtains, carpets, and wall-coverings, and curious eccentricity of design in furniture;" and instead of such frivolous manifestations of affectation, what he would have is nothing more but nothing less than a "practical rendering in good taste and pleasant guise of all the absolute necessities and requirements of modern life," with a "decoration and colouring of our rooms harmonious and pleasant, and furniture sound in construction, comfortable in shape, and fitted for its special purpose"; all which is good philosophy.

One thing, however, that must not be forgotten in dealing in any degree philosophically with such a subject, or with any subject of common art or art for the many, is the fact that the mass of ordinarily intelligent people can never be reached by any artistic movement except through the instrumentality of some kind of affectation, or temporary "craze," as Mr. EDIS calls it, meaning really temporary insanity. This is, indeed, true of many other things besides art, if not of everything of a sentimental turn which concerns the multitude, or the people in that form which we are accustomed to call "the public at large." The higher orders of people can afford to be somewhat independent and singular in their preferences; in other words, a sense of their responsibility to their own importance compels them to do themselves the justice to think, or at any rate to choose, for themselves. Strange to say, the case is very much the same with the lower orders of people; there is a sort of instinct of resistance, if no more, by which they are led to despise what they cannot very well possess. But the great intervening masses of the middle class are found to run together in a drove, and "to follow the fashion," as the phrase goes, with a self-complacent obedience which is often more amusing than edifying to those who can look on dispassionately, and which moreover never fails to develop in one quarter or another a sufficient abandonment of mere common sense to produce a delightful whimsey, or efflorescence of eccentricity, marking the period with a genius of its own which the Philistines of the moment must be permitted to laugh at. The "æstheticism" of the passing day is a phenomenon of this kind, and those of us who consider ourselves to be more particularly the votaries of common sense have been taking the liberty of laughing at it consumedly. It is satisfac-

tory, therefore, to find such an authority as Mr. EDIS, who is not a Philistine, laughing with us; but at the same time there can be no doubt that, without the exaggeration, we should not have the movement at all; and so it comes about that those courageous spirits who seem to put themselves in a ridiculous attitude for the sake of the cause, are, unconsciously perhaps, but most conveniently, and almost meritoriously, sacrificing themselves upon the altar of real art.

It is, in other words, part of the price we pay in happy England for what we call our liberties—that is to say, for the privilege of being governed by our common selves rather than by uncommon, superior, and consequently unpalatable people—that in every great movement of social reform there is a sort of compromise all round of whatever is capable of compromise, so as to do all that can possibly be done in a hopeless effort to avoid offence, until at last something is left by way of residuum, which it is perhaps best to call plainly by the naughty word *humbug*, but which our "public at large" consent in sheer weariness to regard with enforced respect. The case of our pending reforms in artistic sentiment is no exception to this rule. Busy brains and busy fingers are labouring just now in a thousand studios and workshops, to give effect to the English desire and necessity for artistic progress; and our "public at large" take it all somewhat coldly, being themselves quite as busy in other ways; but when in the course of such events it happens sooner or later that by means of a little audacity, or perhaps a good deal, on the part of some particular group of "intense" adventurers, there is displayed before the eye of the multitude a demonstration of the right kind to tickle the fancy, then it is that a sort of consent is indirectly given to this for the sake of its piquancy, and the very exaggeration of the phenomenon becomes merit. Thus it is that the "washed-out colours" and the "ill-drawn ornament," of which Mr. EDIS very properly complains as a travesty of true artistic feeling, are in reality at the present moment no more than an especially emphatic protest against the crude primaries of JUBSON'S dyes, and the spurious finesse of Renaissance and fancy-Gothic forms. Not that the critic will permit himself on that account to bow the knee with the thoughtless many in acknowledgment of that which is not the merit it professes to be, or not merit at all; but he may at the least consent to acknowledge the necessity which human nature imposes upon the best of us, and so forbear to censure too seriously those eccentricities of genius which have a purpose to suit, and which serve it none the worse that they impart a little good humour into the service. Mr. SAMUEL WELLER was not the first philosopher to discover the great truth that "whatever is, is right," and those who see the affairs of this world with the same serene sagacity with which he was so signally gifted, will not be disposed to draw the line even at the æsthetes of to-day; we may laugh at them, and it is to be hoped we may both laugh and win, especially as they laugh so little and win perhaps still less; but we shall do none the worse if we recognise the fact that they really bear the standard of art, and bear it bravely, even if they be decorated in washed-out colours and ungainly ornaments for the sake of enforcing more quaintly the principles they represent.

Nevertheless there is something in common sense that must come to be acknowledged in the end; and there is something in the uncommon sense which, alas! finds its way a great deal too easily into English art, that must come to be discovered and exposed. Our æstheticism, in its broader developments, is no doubt foolish enough, and succumb it must in due time to the sense of better criticism; but to what will it give place? To the absolutely good at last? By no means; rather to some new eccentricity, as we all well know.

Quaintness seems to be for the present the most admired quality in all forms of English art. To be quaint is, after all, to be little better than waggish; and it would be a sufficiently suggestive title to apply to our art in the hands of the public at the present moment, so far as it is very much indeed in the mode, to say that it is a trifle waggish. It is easy to go on from this point to argue that waggish art is only a passing jest, and that every fit of laughter must come to an end in time. Perhaps when we cease to laugh at æstheticism we may be by natural reaction a little too serious. Perhaps the next phase of fashionable art may be too dull, or too priggish, or too sober in any one of many ways; and then we may think of the funny days of the æsthetics with a sigh of regret. It is a

* See page 75 ante, February 3, 1883.

humorous age, not to say a frivolous age, this of ours, and let us make the best of it. Epicureanism is not far wrong as regards art, if nothing else. Let us enjoy what we can while we have it, for that which is to come is nothing to us. Let the higher intellects run forward before the age, but even that let them do with prudence. For "the public at large" let us be content to take what we can get; if it be poor art, it is better to have poor art than none.

WATER-COLOUR PAINTING IN PARIS.

THE fifth annual exhibition of the Société d'Aquarellistes Français is now open at the galleries in the Rue de Sèze, and, in addition to water-colour paintings, there is a special collection of designs and etchings.

The Society has lost one of its prominent members by the death of GUSTAVE DORÉ. It was so unexpected that when the first part of the catalogue was printed off he was working in his studio, and it is only in the supplementary part that the conventional black border encloses his name. In the corridor are several of the drawings which he executed during the siege of Paris by order of the Provisional Government. They represent the works thrown up for the defence of the city, within the military zone, and are in ink, touched here and there with chalk. To the left on entering the gallery are eight of the fourteen drawings entered in the catalogue, according to the list sent in by GUSTAVE DORÉ himself, but of which six lie unfinished in the studio. In *Les Elfes* we have the bank where the wild thyme blows, o'er-canopied by luscious woodbine; to right and left tall and stately foxgloves, and a few richly-tinted blossoms of convolvuli. In the centre stands the Queen, who summons her sprites from east and west; an attendant nymph strikes on a cymbal. In mazy circles the fairies dance in the gray and silvery haze of moonbeams struggling through a screen of trees. *Titania*, and the *Chansons du soir*, are companion pictures, both equally illumined by a glow of golden light. In *Titania* the sun is nearing the horizon; its rays penetrating the foliage of a magnificent group of acacias tinge the surface of a mere with a pale hue of a golden green. On the overhanging branch of the tree the Fairy Queen despatches Cobweb, Peascod, and Mustard to kill cankers in the musk-rose buds and make war on vermin. Flights of fairies are seen cutting their way through the glowing air, while others gambol on faint primrose banks. The sunset glow melts to the mysterious greenish gold DORÉ so delighted to paint, and which he first studied for his Spanish midnight scenes. Against this lovely hue the outline of a castle is discernible. In the companion picture the branches of the tree in the foreground sweep to the water's edge. Fairies with their butterfly wings have alighted on the feathery foliage of the acacia, which is reflected on the glassy surface of the water.

It is a long journey from the court of OBERON, with the revels of fays and elves, to the heart of the City, but DORÉ's brush has cast a glamour over a dingy street leading to a huge brick warehouse, which appears more strange from its terracotta ornamentation. The view is taken from above. We look down on a narrow lane, along which a heavily-laden waggon is making the best of its way. A porter standing at an open door on the fourth storey watches a barrel swaying in mid-air, and hoisted to him by means of a crane which projects from above. Its progress is observed by a woman at a loft-door in the opposite store-house, shadowy in the glimmering light of a lamp supported by a bracket fixed at the angle of the house, and now burning, for the winter's night is dark. DORÉ believed there was picturesqueness to be found in a Thames Street warehouse, but especially he delighted in the docks. He has drawn St. Katharine's Docks piled with barrels; the crew of a boat in the foreground are landing, one of the men has thrown his frayed and faded serge coat over the gunwale. The hot midday sun strikes on it, and casts its shadow in a purple patch on the dull grey water. There is a hurrying to and fro on the quay, while the air is still and calm, for it is summer. In marked contrast is the glacier view in which no trace of human life is to be seen. We are on the steep side of an Alp. In the rear glaciers rise tier on tier till their furthest range is capped by clouds. Their melting surface supplies a cataract which leaps some hundred feet to a mossy plateau, and forms a stream which courses downwards between rocks covered with vegetation. Another view of the same stream is taken lower down the mountain

side, where the more genial climate has fostered a river vegetation. Velvety moss covers the earth surface, trees have sprouted in the interstices of the rocks, the stream widens and breaks in foam over the jagged stones which impede its course. Intensely vivid is the green of the foliage on tree and ground. One huge boulder of iron grey limestone, grim and dark, patched here and there with white lichen, is on the right. Sunlight from the background breaks through the trees and turns to silver the higher water, glinting among the trees on the upper rocks, but not reaching the lower foreground, which is in deep shadow. The head of a young girl, on whose wan countenance hunger and pinching care have set their seal, is the last work DORÉ contributed to the Exhibition.

The whole wall space at the end of the gallery is occupied by MM. DETAILLE and DE NEUVILLE's drawings of the battle of Champigny, which are studies for their magnificent panorama. M. DETAILLE's three pictures show scenes on the ground to the right of the railway station, where the heaviest fighting took place. In the first the sedgy plain, intersected by the road to Champigny, then deep in snow, is before us; several poor fellows sleep their last sleep in the foreground. An empty cart, a grey horse, Frères Chrétiens, who inquire of an officer their way; a dying man carried to the rear by two of their order, are in middle distance. Further to the front a group of staff officers watch the line of fire. The white great coats of their orderlies are blown about by the fierce wind. A shell has burst near them. In the second drawing a detachment is seen marching to the front, the bitter north wind driving right in their teeth. Some dead lie on the cross road near an ambulance cart, on which is displayed the red cross of St. John and a white flag. To the right a line of tirailleurs keep up a sharp fire at the enemy, who is out of sight. M. DE NEUVILLE's vigorous touch is manifest in the drawings, which depict the storming of the ruins of the railway-station. The enemy occupy the opposite side of the line and a square house amidst trees. The French are swarming up the rising ground. Young DE D—, who raised a regiment from his own tenantry, leads the charge. His death-cry, "En avant, Auvergne!" rang through the air as he fell shot through the heart. His brother-in-law, the Comte DE R—, then became leader. The blue caps of the Germans are seen through an arch. Their comrades pour a deadly fire from the square house on the French standing near some *caissons* on the right in the foreground. One poor fellow, himself wounded, staggers as he bears a dying comrade to the rear.

A drawing in which the end of the railway-station appears, riddled by shot and shell, shows the last charge. A telegraph-post, with a broken line attached, and a shattered shed, are in the middle; beyond, the red-tiled roofs of Champigny are dimly visible through the haze caused by the smoke of the heavy guns; further sweeps the wide plain, dotted by a few leafless trees.

In another of the series M. DE NEUVILLE depicts the dwelling of a forester, built against the corner of a park wall, and behind is the farmyard. A shell has rent a gap in the house; a small body of French are crossing the yard, and some are clambering over a palisade on the embankment which separates the farm from the outlying land, with the purpose of firing from its shelter on the flank of the Germans engaged in attacking the railway-station. The architectural lines of the building, the soft, yellowish tone of the house, the pale red of its roofs, and something *vaporeux* and undefinable in the atmosphere of the landscape beyond the park, combine to make this composition singular and attractive.

M. BASTIEN LE PAGE contributes three drawings besides some studies. His *Nuit tombante* is a clever rendering of nightfall in its effects on the buildings of a village, and especially on the square clock-tower of its church. The small studies, some of which are only a few inches in diameter, are excellent. One represents St. Peter's and the Castle of St. Angelo beneath a sky crimsoned by a setting sun which makes the surface of the Tiber blood-red. In another we have an effect of storm on sky and sea, a barque under closely reefed sails lying in the trough of a rolling wave, its deck swept by successive seas and drenched by pitiless rain.

M. VIBERT, contrary to custom, sends a life-size portrait of Dr. DANET, to whom France owes her preservation of the Palace of the Luxembourg from the pétroleurs of the Commune. General DE MONTFORT, in command at the time of his appointment by the Intendant Militaire, having been ordered to the front, Dr. DANET remained in charge, and for

his services was made Commandeur of the Legion d'Honneur. The strong individuality of the well-known doctor is finely expressed. The half-closed eyes with which he scrutinises a patient, the pleasant smile with which he has dispelled many an alarm, are characteristic of the man. The rosette on the coat alone relieves the sombre black which custom prescribes; but M. VIBERT has taken his *revanche* on the gorgeous scarlet of the Cardinal, who has fallen asleep while examining the letters contained in an open casket that stands on a green covered table. One delicately small billet is still "twixt finger and thumb." His Eminence smiles. Behind him, clad in flame colour, stands MEPHISTOPHELES himself, his red legs clear against the light of the fire blazing in the vast grate. He whispers, "Souviens toi du passé." Yes, his Eminence remembers. In a different style is *Les pigeons du harem*. The eunuch stands against the wall, looking contemptuously at the birds on the rim of a basin. Beneath his furred robe is a coat of white cloth, the broad belt is of embossed silver, his tall caftan is so purely white, the paper is left blank for the high lights. There is a lovely hue of rose on the porphyry vase, on which soft grey pigeons perch and coo to some white doves at its base. But with the exception of this flush of rose on the vase, and the green on the tessellated pavement, the picture is worked out in pale greys, soft yellows, and faint lilacs. In no such subdued tones, however, has M. VIBERT painted his *Executioner* whetting a sword. Green, crimson and orange are lavished on the costume of the Oriental, as well as on the background of the picture. M. VIBERT'S *Une Cause Célèbre* is full of humour. The scene is laid in a French court in the eighteenth century. A colombine and a pierrot have been captured by three sergents-de-ville during Carnival, as they were abstracting a couple of ducks from a poulterer's shop. But while the ancient advocate, after the manner of his profession, is asseverating his clients' innocence, the ducks emerge from the basket to the consternation of the prisoners.

M. LOUIS LELLOIR'S small sailor *Monsieur Jean* is seated astride on a square stool of grey velvet. Monsieur Jean clearly differs in argument from his unseen interlocutor. His little hand is clenched on his bare knee, the other, reversed on his blue serge jacket, has energy in its pose. The large blue eyes, the open nostril, the parted lips express firm will and high spirit, and suggest that Monsieur Jean will fight for "La Patrie" some day. The flesh is treated with a soft blending, and a firmness of touch almost unrivalled, and so careful is the detail we can see the flush of colour beneath the skin and count the hair of the eyelashes. The figure is dark on a white background: so is the portrait of M. FÉVRE, of the Comédie Française, as he appears in the character of *l'ami Fritz*, taking his ease at a table garnished by tankards, and seated in a wide straw chair, on one arm of which lies his pipe, ready charged. He wears a coat of soft, white cloth, an unbuttoned red waistcoat, an immense extent of linen, lilac breeches, and grey-blue hose. For clear, bright colour, and exquisite finish, this little portrait can hardly be surpassed. In a bolder style, with a brush full of wet colour, the *Molière* is painted. The dramatist, in flowing wig, lace cravat, and coat of tawny velvet, is writing at a green-covered table, laden by ponderous tomes. He pauses, and small wonder, for Poetry herself has flown to his chamber from the summit of Parnassus. She flings her lovely arms around the favoured of the Muses; with her taper fingers she guides his hand while she whispers thoughts which have made his name immortal. The silver-grey feathers of her great, outspread wings, and the dark cloud in which she has descended, form an excellent background, against which the undulating lines of her figure, swathed in rose and pink draperies, are well seen. The drawing is for the frontispiece of the *Théâtre de Molière*, the illustrations for which, by M. LELLOIR, are remarkable for composition and the exquisite delicacy of their drawing. Some of the original drawings were reproduced lately in *The Architect*.

L'Homme aux Cardinaux has not forgotten the subjects which attracted the attention of the English public at the Grosvenor Gallery. M. HEILBUTH again gives a scarlet-robed cardinal, who leans over the sculptured balustrade in his palace gardens, while his carriage awaits his pleasure at the extreme end of a stately avenue of ilex. But more interesting is the artist's rendering of summer atmosphere and pellucid water in *Bords de rivière*. Round the posts which support a

float on the still surface, which, grey and clear, reflects fleecy clouds, the blue of the summer sky, and the feathery foliage of the ash which border the opposite shore. The shallow water at the shelving bank, the dark shadow under the landing-stage, the play of light on the plants, tell of study in the open air. No less repose is found in *Dans le Verger*, in which is a woman lying on the grass near a lake by the side of her small son, and sheltered by flowering shrubs. There is one touch of intense colour in the crimson of the lady's hat, and it is found precisely where it was required, that is, on the grass beyond her. There is also a portrait or *étude* of a lady clad in pink and crimson, enjoying the cool of evening, seated on a stone bench at the end of the terraced walk in a garden rich with the hues of various flowers. The air is apparently heavy with the perfume of roses and carnations. She looks as though the surroundings suited her gentle nature.

One of the subjects selected by M. DE BEAUMONT has been often treated—a housemaid reading her master's or mistress's letters. She reclines in the arm-chair, with her feet on a stool. Her cotton gown, of pale pink, is gathered over a black petticoat; she has tucked her feather broom under her arm, and the bit of scarlet leather on the tuft of grey feathers counts for a great deal. This is a spirited drawing, bright and clear in tone, and clever in conception. There is a charming drawing of CUPID, with his hands behind his back and wings outspread, before whom a young girl kneels, the better to listen to his mischievous suggestions. The group is painted for a fan. M. DE BEAUMONT'S *Sorcellerie* somehow recalls the story of "La Belle Dame Sans Merci." The sorceress, clad in scarlet skirt and chemise, turns her back to us while she holds a good knight's sword over a cauldron, beneath which are blazing faggots, and she has drawn a mystic circle around a frog. She may be a dweller in Acheron, but her figure is faultless, her limbs rounded, and her breast and arms admirably modelled. A characteristic figure is that of the girl who, after examining her finely-chiselled features in a small mirror, is *contente d'être jolie*; and no less attractive is another girl in a pink skirt tightly wound round her limbs, who, seated on a stone bench, studies a bunch of wood flowers. In M. DE BEAUMONT'S drawings of this year we find freedom of touch, masterly style, a correct draughtsmanship denoting immense progress. The remaining water-colour drawings will be described in another article.

THE WELLINGTON STATUE.

N EARLY half a century has elapsed since the project was matured of erecting the colossal equestrian statue of the Duke of WELLINGTON, which is now being removed from the arch at Constitution Hill, and after so long a time its history may not be generally known. The origin of the statue we believe is due to Sir F. TRENCH, a gentleman of fashion, who amused himself with projecting works of various kinds. He was enabled in course of time to persuade many noblemen and gentlemen to co-operate with him. There was not much difficulty in finding funds for the purpose, and on June 16, 1838, a deputation of the sub-committee, including the Duke of RUTLAND, the Marquis of LONDONDERRY, the Earl of ABERDEEN, Marshal BERESFORD, and Lord HILL were able to wait upon the Duke of WELLINGTON, at Apsley House, in order to obtain his approval of the proposed memorial. The Duke of RUTLAND was spokesman, and he said that the QUEEN had been graciously pleased to express an interest in the project, and had (like her uncle, the late KING), given her consent to the erection of an equestrian statue upon the summit of the triumphal arch opposite Apsley House. From this it will be seen that the site was early chosen, and it may be added that HER MAJESTY subscribed 500 guineas, and Prince ALBERT 100 guineas towards the cost. It was announced on that occasion that the committee had selected Mr. MATTHEW COTES WYATT as the sculptor, and the DUKE was requested to communicate with him occasionally in order to insure perfection of execution, or, in other words, to give sittings—an operation which His Grace was weary of undergoing. The Duke of WELLINGTON in reply said that he could not find words to express the satisfaction and gratitude which he felt at the prospect of the erection of a memorial of his military services in that part of the metropolis. The last words deserve attention, for it was supposed that the origin of the statue was to be attributed to another cause besides admiration for the DUKE, and that was, sympathy with the sculptor. WYATT'S statue of

GEORGE III. in Cockspur Street was much admired by several City magnates, and they wished to give him a commission for the statue of the Duke of WELLINGTON, which was to be erected near the Mansion House. But the friends of Sir FRANCIS CHANTREY were a little more influential, and they succeeded by a single vote in securing the commission for him. The result is the statue opposite the Royal Exchange, which on CHANTREY'S death was completed by Mr. WEEKES. To compensate Mr. WYATT for his disappointment his patrons were believed to have devised the more lucrative commission of a West-end memorial, in which vestries and corporations would have no share. It was also asserted that not only was WYATT paid an enormous sum of money, but several cannon were presented to him to be converted into bronze. As regards money, WYATT gave no estimate of the probable cost of the group to the committee, and he may have received about 30,000*l.*, which included a part of the cost of fixing. But only one cannon was granted by the Ordnance Office and it was used for the DUKE'S head. It is true that after the battle of Waterloo sufficient captured cannon were assigned for a statue of WELLINGTON which was to be erected in Dublin. When a big obelisk of granite was preferred in that city, some of the cannon were utilised for the statue of NELSON, surmounting the column in Trafalgar Square, and others for the WELLINGTON statue in the City. The surplus metal, which weighed about three tons, and was of little use for military purposes, was transferred to WYATT, so that the contributions of material did not in all amount to more than four tons, or one-tenth of the weight of the group. The smallness of the quantity of Government metal is remarkable, when it is remembered that at the time the DUKE had regained his old popularity. The sculptor was also possessed of friends in the Palace. MATTHEW WYATT was a son of GEORGE THE THIRD'S architect, and when a boy he was favoured with the patronage of the KING. But it may be assumed that cannons were withheld from him because, in some of the departments, the project for erecting the statue was not approved. It was not an official work, although in the popular mind its existence was attributed to an official source.

In 1842 the modelling of the group was finished, and critics who were permitted to see the work in the studio were delighted with its appearance. One extract from a periodical will suggest the height, or rather depth, reached by professional criticism in those days:—

The whole design is complete, and no less than 27 feet in height, the largest monument of the kind that ever was modelled. Yet so exquisite are the proportions of man and horse, that the spectator hardly thinks of their magnitude till the comparison with some known object forces on his mind the conviction that they possess the elements of the sublime as well as of the beautiful. A great difficulty in equestrian statues is to give sufficient importance to the human figure, which physically contrasted with the splendid form of the animal, is apt to become subordinate in the general effect. This the artist has overcome, as he has other minor difficulties of composition, in a masterly manner. The Duke is in his martial cloak, admirably draped, and extending his right arm with the *bâton* of command. The limbs are massive, and finely disposed, and he holds his seat like a practised rider. The hat on his head (one of the minor difficulties to which we have alluded, as the actual shape is singularly inconsistent with grace) has been rendered not only agreeable, but highly impressive as a finish, by the skilful adaptation of the plume of feathers by which it is shaded and relieved. The likeness to the Duke is at once striking and elevated; no portrait could be more correct, no artistical conception of it more heroic.

If such be the merits of the chief object, what shall we say of the horse? We really want words to express our boundless admiration of it. In grand repose, every joint, muscle, and vein marked with anatomical accuracy, there is a softness and sweetness about the whole animal which indicates his blood and breeding; without the strain of a single line to divert the eye into the examination of parts, however true to nature in their minutest lineaments, and deserving of being separately studied. The jockey could not find a fault—the painter could not discover a blemish; and such were among the visitors who, when we were also present, gave their opinions upon this glorious production. The head alone is all fire—fire in perfect keeping with the repose and dignity of the body and limbs, though the horse “smelleth the battle afar off.” Except in the St. George, by the same hand, we have never seen anything like this head, neither in modern art nor in Elgin marbles. No description can convey an idea of it, nor, indeed, of the immortal group in which it so conspicuously shines.

The greatest admirer of the Duke of WELLINGTON would now hesitate to accept the foregoing criticism as expressing the

qualities of the group, and it says much for the good sense of the public that when the equestrian figure was seen in the streets it was almost universally condemned.

When the statue was cast the official difficulties began. The top of the arch had not been selected as the site by a member of the Government, but from the circumstances of the case it was necessary to appear in favour of that position. In May 1846 the subject was introduced in the House of Commons by Lord R. GROSVENOR, and it was asserted that the arch was too weak to support a group weighing 40 tons, and that the space on the top was too small unless, contrary to all precedents, the horse was placed standing across the arch. Sir ROBERT PEEL in reply, explained that the permission to use the arch had been granted by WILLIAM IV., and was confirmed by the QUEEN. The Government, he said, were willing to pay for a suitable pedestal, and to give a site for the group in Hyde Park near Apsley House; or in the open space between the United Service and Athenæum Clubs; or somewhere near the Duke of YORK'S Column; or near the Horse Guards, if the committee approved. But that approval, as the lawyers advised, could not be given, inasmuch as the arch was specified when subscriptions were sought. The discussion consequently led to no alteration of the site, although the opinion of the House was evidently opposed to utilising the arch for such a purpose.

As there was no disputing the lawyers' opinions, the group was on September 29 despatched from Mr. WYATT'S studio, escorted by two regiments of Guards and a party of sailors. On the next day, under the direction of an official from the Woolwich dockyard, it was raised to about the level of the arch, and on the third day it was moved horizontally and lowered into its place. When the hoarding was removed, there was little difference of opinion about the defects of the group, and probably no work of a sculptor gave opportunity for so many jokes. The question then was where to remove it. The law had been obeyed to the letter, and no litigious subscriber could take an action against the managing committee for breach of trust or other offence. It was even asserted at the time that the statue was not to remain on the arch for more than three weeks. There was a new Government, and Lord MORPETH, who wrote pretty verses and was supposed to possess taste, presided at the Office of Works. Without delay his lordship solicited the opinion of the Royal Academy, and it is needless to say that, with the exception of two or three members, all the Academicians recommended that the group should be removed from the arch. The Council of the Institute of British Architects characteristically volunteered advice (or rather applied to be allowed to give advice), although they were no more consulted than have been their successors in respect of the Piccadilly improvements which are now in progress.

But there was one difficulty which appears to have been overlooked. The Duke of WELLINGTON cared little about the defects of the figures of himself and his charger; he saw in them only an expression of good-will from his friends, and for their sakes he felt bound that the intentions of the subscribers should be respected. He made the retention of the group a personal question, and his wishes were almost omnipotent. It was inevitable that difficulties should arise in the Government offices. Sir ROBERT PEEL said his Government were willing to provide a statue and pay the expenses of erection, but Lord MORPETH was bound to respect economy, and all he could offer was that the statue would be received, if duly delivered, in Waterloo Place, but that the bill for the pedestal, fixing, and contingencies must be sent to the committee. The committee, on the other hand, declined to do more than place the statue on the ground at the foot of the arch, leaving its removal to those who were supposed to disregard the wishes of the Crown. There was a deadlock in consequence, in which great interests were involved, and the only escape from it was to have recourse to that policy of *laissez-faire* which never fails in this country. Like greater evils the defects of the group were endured, and they have become so familiar as to cease to be eyesores. The equestrian statue is at last to be removed, but the people who have been indifferent to the destruction of historic buildings are anxious to secure the preservation, in a prominent position, of a work that is only remarkable for the large quantity of metal that was wasted in its production. That it has admirers is evident when it is found that a committee consisting of distinguished persons are to seek an eligible site for the group.

PARIS NOTES.

AT the last meeting of the Commission of Historic Monuments, it was unanimously decided to petition the Minister of Public Instruction and Fine Arts against the continued occupation of the old papal palace at Avignon as a barracks. Numerous letters which have been received by the Commission unite in declaring that the presence of the troops in the palace is a permanent source of profanation and damage, both to the structure itself and the fine mural paintings and frescoes it contains.

The examinations for the admission of pupils to the Ecole des Beaux-Arts have been held during the past week. The competitors are bound to pass (1) in a written composition on various historical subjects; (2) in an anatomical drawing; (3) in an emblematic design; and (4) in the sketch of a living model. The successful pupils are alone allowed to follow the lectures and work in the studios of the school, and are furnished with a special card or diploma setting forth this right.

A sum of 800*l.* has just been voted by the French Race Committee for the acquisition of two works of art to be run for in Paris during the year 1884. The Commission charged with the choice of the designs have, as is usual in France, decided to proceed by way of a competition open to all artists resident in the country. The greatest latitude is allowed in the conception of the work, which may assume the form of a statue, group, vase, cup, &c., but it must be executed in some precious material. Designs must be sent in to the Secretary's office on or before July 15 next.

It has been decided to exhibit Doré's statue of Alexandre Dumas the Elder in this year's Salon, but for its execution in marble or bronze further funds are needed. The subscriptions have only reached about 57,000 francs, and at least another 30,000 francs will be required. M. Alexandre Dumas-fils offered to make up the difference, but the Société des Gens de Lettres and the Société des Auteurs Dramatiques, who are managing the affair, have declined the offer, and intend to appeal to the public for the balance.

Two legacies have lately been left for the encouragement of art in France. Madame Pigny, widow of the well-known architect, has bequeathed a capital sum of 50,000 francs to the Académie des Beaux-Arts, for investment at 4 per cent., to produce an income of 2,000 francs, which is to be handed each year to the winner of the second Grand Prix de Rome in Architecture; and a Madame Montvoisin has left a capital sum to the Ecole des Beaux-Arts, sufficient to found two annual prizes of 400 francs each, in favour of the first Grands Prix de Rome in Painting and Music, on condition that the recipients shall lay a wreath on her tomb in Montparnasse Cemetery.

Several important alterations and additions are being made at the Louvre. The spacious Salle des Etats, used under the Empire only once a year, on the occasion of the opening of the Chambers, is being turned into a picture gallery. The change is, however, attended with considerable difficulty, for the hall is at present lighted by side-windows, which will naturally be covered by the canvases to be hung, so that it will be necessary to remove the present roof and replace it by a skylight. When opened the new room will form a much-needed means of communication between the gallery that runs along the whole length of the river front of the palace and those containing the works of the French school.

Under the superintendence of a committee specially appointed for the purpose, a new process for cleaning and restoring pictures has just been tried on some of the Louvre paintings. The experiment has completely succeeded with Poussin's *Bergère d'Arcadie*, as also in the case of a painting by Borgognone, and it has consequently been decided to employ it for the restoration of other works by Poussin and of the same school, at present much disfigured by the injurious effects of the varnish with which they are covered.

A proposition relating to the construction of blocks of workmen's dwellings on the site of the old Montmartre Cemetery, and on the open space of the Champ de Mars, has just been laid before the Municipal Council. The projectors of the scheme offer to lay out and make all the streets traced by the City Architects, to erect on the frontages of these thoroughfares such buildings, warehouses, shops, &c., as may be best suited to the requirements of the quarter, and to construct in the rear, round the quadrangles or interior courts usual in most modern *maisons de rapport*, buildings entirely devoted to workmen's dwellings. In return, they demand from the City a concession of the ground and free supply of water and gas for street lighting and cleansing. These blocks, some of

which would be four and others six storeys in height, are to be divided into apartments consisting of a bedroom, kitchen and eating-room in one, and water-closet, a certain number in each building being further provided with another small bedroom for children.

In all the public squares and parks of Paris the gardeners are already commencing their operations for the season. Ordinarily work does not begin before the middle of March, but the mildness of the past winter and of the weather now prevailing has thus advanced it by at least three weeks. About 800 men are employed for this purpose.

The Paris Town Council have decided to establish a municipal museum of hygiene, which will be organised and maintained at the cost of the City, a sum of 16,000 francs having already been voted for the preliminary expenses in connection with its creation. For the reception of the new museum it is proposed to utilise the chapel of the Hôtel Dieu, with its annexes.

ANCIENT LIGHTS.

THE following remarks have been addressed by Professor Kerr to the Special Committee of the Institute of Architects on Light and Air:—

In response to the invitation to members who have had experience in questions of ancient lights to state opinions upon various points suggested, I have to offer the following observations—which I ought, perhaps, to have sent in much earlier—based upon what may now be called a long practical acquaintance with the subject.

With regard to the suggestion that a special *Technical Tribunal* should be instituted for the settlement and adjustment of disputes regarding ancient lights, it seems to me more feasible to advocate the establishment of such a Court for building, engineering, and architectural processes of all kinds. This, I think, is much wanted; having regard not only to the peculiar character of the business, but to the large amount of it which is always seeking proper settlement, and generally in vain. But the proposal to have a Court for nothing but ancient light cases would, I apprehend, meet with no attention from the authorities; the field being much too narrow. How to constitute a general Building Court is not now the point. But it may be confidently said in passing that architects or surveyors could only claim to be acceptable as assessors or reporters, and never as judges. This point, I think, was settled thirty years ago in the case of the Official Referees of the then Metropolitan Building Act, whose adjudications were so unsatisfactory as to bring about a sort of revolution.

That a system of notices of easement as regards new lights might very fairly be introduced, seems a reasonable suggestion. I do not see why every owner of a new building should not be required by law to advertise, and that in the most specific way, whatever claims he seeks to establish over the property of his neighbours; and if it be considered that this principle of compulsory advertisement cannot be carried into effect, then it seems certainly fair that a neighbour should be allowed by some form of protest to protect his property against the establishment of such claims.

The question of the rule of forty-five degrees appears to me to require more explanation than it receives. A little consideration will prove that there is no really scientific ground whatever for such a rule; and, much as any one might wish to see a rule of some sort recognised, I for myself cannot imagine how this one could be made anything like universal in practice. The only basis of an apparently solid character upon which the principle of the forty-five degrees can be supposed to rest is the circumstance that, amongst the building regulations of the Metropolis, there has long been a certain provision as regards new streets, to the effect that the general height of the houses (for there must be exceptions) shall not exceed the width of the street. This is primarily for the sake of ventilation; but it may be argued that we have consequently, if unconsciously, adopted the practice, in building new houses, of making the size of their windows suit the conditions of this regulation, and therefore that the protection of those windows may reasonably be based upon the same conditions. But the Master of the Rolls, in adopting to a certain extent this view of the matter in the often-quoted case of *Hackett v. Baiss* (in which I was concerned for the plaintiff), expressly pointed out that he did so only for the occasion, and because of the particular simplicity of the circumstances, namely, that the defendant was building a higher house than usual in a street of the very commonplace width of about thirty feet; and indeed his lordship, some time afterwards, when the rule of forty-five degrees, thus said to be established by him, had been repudiated in another Court, took an opportunity of again explaining that he could not possibly apply the principle as a rule. At the same time it may perhaps be frankly admitted by most architects that there is something in the look of the angle of forty-five degrees, if acknowledged to be an entirely empirical principle, which in very many circumstances, and possibly in most, seems to be acceptable practically as a limit

for neighbourly exaction and neighbourly concession in densely populated towns. But after all it will be found that even this carries us a very little way; and probably it is best to put the proposition thus, and rest content with it: that if the windows of our houses, shops, and offices, on all floors alike, were arbitrarily declared to be sufficiently lighted, neither more nor less, when inclosed at the angle of forty-five deg., not only in front, but all round the semicircle of the outlook, as few exceptions as possible being excepted, it would be easy enough for us to accommodate the windows to the rule, and to accustom ourselves to be so far satisfied. The difficulty, in a word, is to accommodate, not new windows to the rule, but the rule to old windows.

I am thus led to advert to a question which I have often asked, namely, whether the improvement of a plaintiff's windows could by any means be recognised by the Courts as an element in their decisions. It is not too much to assert that in almost every case this remedy could be easily and quite successfully applied. That is to say, if a plaintiff's window, being of a certain size, has admitted to the room what we may call a certain quantity of light, derived from a certain area-value of exposed sky, and if that area-value is, in the fair interest of the neighbouring property, diminished in a certain proportion, then the enlargement of the window in the same proportion will restore the value of the easement. For general light and direct light alike, it is plain that this must be so; but, of course, the legal difficulty is insurmountable so long as the plaintiff is held to be entitled, against all reasoning, to keep his window arbitrarily as it is. Another question, however, which I should like to ask with regard to the doctrine of this arbitrary right to the pound of flesh is this:—Seeing that an easement of light is a possession of property of vague character and indefinite limits, could not some general principle of equity be brought to bear upon it (if no better than the old fiction of the lost grant, which could not be otherwise than a perfectly vague and indefinite grant) whereby a court of justice might insist upon defining limits for the occasion, according to common sense, common fairness, and common neighbourliness, which are the essence of justice?

In order to help out this suggestion, I may perhaps be permitted to propose that the element of compensation in money should be more freely introduced than it is. If I understand the law aright, it is already within the power of the Court, when a prohibitory injunction is applied for and the case made out, to substitute money damages without any more ado. This being so, the door seems to me to be wide open for a judge to set his face resolutely against the oppression which is so common in ancient light cases, by simply making all ordinary injuries matter of compensation; and why defendants' counsel do not press this more than they do I cannot very well see. Not only so, but, as the costs are in the discretion of the Court, this again furnishes the judge with a powerful instrument for enforcing fair dealing if he will consent to prefer substantial justice to dogmatic law.

I need scarcely say that the improvement of windows plus money compensation becomes another form for judicial decision which might be of still greater service; and I may add what seems obvious—that in respect of compromised arrangements, as above suggested, I would ask the legal adjudicator in every case to avail himself of the assistance of a professional architect.

I will now beg leave to say something upon what I regard to be the proper province of the architect as an expert in the kind of business under review. My personal experience leads me, as the foregoing observations show, to the conclusion generally that there is little if any necessity for architects to seek an alteration of the theoretical law, even if this were attainable, which I believe it is not; but that it is rather their duty to promote a better understanding upon the practical issues, so that the policy or custom of the Courts may be directed, as I believe it may, towards the frustration of a species of very hard dealing which it is at present much too easy to attempt, and much too difficult to defeat; and which, if the judges could be fully informed of the facts in a practical way, would be by them denounced as all architects denounce it, instead of being apparently justified and encouraged.

The investigation of a case of alleged damage to ancient lights is a process of two parts. First comes this question, What are the particular facts? Secondly this, What is the application of the law to those particular facts? It has to be remembered, therefore, that if the facts are wrongly stated, the result of an application of the law must be expected to be wrong also. Now, the correct statement of the facts is, speaking generally, the province of architects; and whenever the conclusion arrived at by a court of law is oppressive or mistaken, this, I am prepared to say, is always due to the facts being wrongly laid before the Court by the architects employed as witnesses.

What the Court wants an architect to say in almost all cases is simply whether an admitted interference with the amount of light enjoyed as an admitted easement by a certain window occasions a material detriment to the comfort and convenience of the apartment lighted by the window; and all who have had sufficient experience will agree that this is a question for scientific demonstration alone. That is to say, direct evidence is not to be relied upon in these cases as it commonly is. Indeed, when direct evidence of this particular kind comes to be inquired into, it turns out to be

after all only evidence of opinion, and not in any way the testimony of fact which it is expected to be. In other words, there are so many subtle scientific considerations involved in the cause, that the effect is beyond the estimation of casual or inexperienced observers; and when the plaintiff or his servant says, "I cannot see my goods nearly so well as I used to do," "I have to light the gas half an hour earlier than formerly," or even (as in one notable case when the plaintiff went into Court with a green shade over his eyes), "I have sacrificed my sight in writing at my table," the truth may be that he has fully as much light nevertheless as people generally are satisfied with, and very possibly that the lighting can be proved beyond all scientific doubt to be diminished, if at all, immaterially. The observation, experiment, and reasoning, therefore, of professional scientific experts come to be much more reliable; and if some judges have been known to disparage such evidence, this has been owing to the bad quality of what they have seen of it.

By this bad quality of evidence I mean its want of sound scientific reasoning. Most architects are content to make oath that the light in question is in their opinion—having indicated the value of this opinion by stating the number of years they have been in business and the nature of the appointments they hold—either not diminished at all (when they are for the defendant), or so much diminished as to render it quite useless (when they are for the plaintiff); and if they are subjected to cross-examination they have little else to say by way of assigning a reason except that their opinion is founded on their professional skill, and that they adhere to it firmly. The consequence is that the judge has often to say, almost in disdain, "Here we have the usual conflict of scientific evidence; and, without imputing intentional misrepresentation to either side (and so on), all I can do is"—in effect to jump to any conclusion he sees open to him, perhaps to rely upon the fallacious representations of a model, or, what is worse, to conclude that the occupants of the house must be the best witnesses to the materiality of the injury that has been done.

At one time an inspection by the judge used to be frequently made, and this was of much service to the cause of justice; but the proceeding generally seems to be considered to be at variance with judicial principle, as it makes the Court a witness in the cause; and again, although no doubt it is right to hold that, in all building cases, without seeing there can be no understanding, yet, even when the judge has qualified himself by personal inspection to understand all he can, it must be acknowledged that the opinion he may form is only after all that of a person who is not acquainted practically with the business in hand. The necessity for architectural aid is therefore only the more clearly manifest, and it is in fact generally supplied by the attendance of a "shower" on each side; but it has always seemed to me that a third and independent architect ought to be present.

Sometimes an inspection by a jury is claimed; and this affords, no doubt, a certain protection against flagrant injustice; but it is not every case of ancient lights that can be confidently left in the hands of a jury; and, moreover, it is easy for a plaintiff to enter the cause in a Court where a jury will not be allowed.

When the Court, with the consent of both parties, calls for a report by an architect, the first reflection that arises in one's mind is that this course surely could have been adopted before the law-costs had been incurred; but otherwise it cannot be denied that a reference of this nature is the best course that can be taken, if the referee be well selected; and it therefore occurs to me to ask whether a defendant might not be allowed at the outset, by a custom of the Courts, in some approved form, to challenge a reference, so that, if it be refused, he may submit this fact to the Court at the end as a reason for throwing the unnecessary costs upon even a successful plaintiff.

But what is of most importance to the interests of justice is that architects should qualify themselves to deal with the question of damage to light by scientific calculation. If such qualifications were properly cultivated, not only would the facilities for settling disputes privately be greatly increased, but, in case of direct difference of conviction narrowed to the utmost by men so fully able to render a reason for their opinions, a Court of Law would be much more likely to arrive at a just conclusion after hearing the rival views thus properly accounted for.

As regards the mode of ascertaining scientifically the amount of obscuration involved in any case, I have not changed the opinion I put forward many years ago, that a superficial diagram of sky surface, with the old and new sky lines geometrically projected thereon, and the value of intervening area mathematically calculated, is the only sound basis on which to form a correct judgment. (It may be well to explain that the tables for the measurement and valuation of sky area originally given in my book on "Ancient Lights," although correct in principle were far too vague, and have long been superseded by others which I subsequently prepared more minutely. The accuracy of these was disputed by Mr. Homersham Cox, Q.C., in his treatise on the subject; but Mr. E. W. Tarn, an architect well known for his advanced mathematical work, was good enough to go thoroughly into the matter, and he confirmed my calculations, carrying the results into still greater decimal minuteness. See the "Transactions," 1869-70, page 160.) But, however minutely, or however accurately, we may apply in this way the measurement and valuation of sky area, it is plain that this goes no further

than to determine what percentage of the original sky-value is obstructed; and the chief points at issue still remain; namely, first—What proportion, in ordinary circumstances, is the measure of material damage? and secondly—Are there any particular circumstances in this case which affect the question of measure; and, if so, to what extent do they affect it? I will assume that there would soon be no insurmountable difference of opinion upon the mode of geometrical admeasurement; perhaps, also, there might be an agreement upon some general rules of material percentage; but the last point—the application of special circumstances to the result—would, no doubt, still involve in many cases a great deal of difficulty.

At present the Courts of Law are usually prepared to receive favourably enough the evidence afforded by the geometrical admeasurement of an obstruction; but, when the percentage is thus arrived at, they have been so entirely unable to turn it to account, that counsel often consider it dangerous to introduce or even suggest such evidence. A convenient substitute is found in the apparently simpler shape of diagrams of vertical section, which show at what angle of altitude the old summit stood, and what is the increased angle of the new; but this process, even when elaborated to the utmost, is only an imperfect equivalent for the diagram of surface projection above alluded to, and when a judge relies upon it he requires to exercise the greatest caution. Indeed, in the hands of witnesses who produce such drawings without a thorough knowledge of the subject, they threaten to become only additional instruments of imposition; and there have been many instances in which evidence of this kind, speciously presented, has created an erroneous impression which nothing could afterwards remove.

The late Mr. Bell (District Surveyor of St. George's, Hanover Square), who was a very shrewd authority on the subject, used to maintain that the projection and measurement of angles in this way ought to be done, not outwards or externally from the window towards the sky, but inwards or internally from the sky into the room. I have frequently found this plan serviceable, but more especially when the issue turned upon the use of the room for work rather than upon its general lighting for mere occupation. In the one case the question is how to work under direct light at this or that convenient spot within the room; in the other case it is how much light is to be delivered through the window for the illumination of the room as a whole. The distinction is an important one; but it is obviously one for expert application alone.

The only other observation which I will take leave to offer is upon a very important point, namely, the indescribable variety of issues as regards the details of the particular circumstances, in claims and defences alike. It is not the simple question of right or wrong that comes up so much as the multifarious pretences and fictions that have to be dealt with, advanced by owners and surveyors quite as speciously as by lawyers, and maintained even more obstinately, requiring often an amount of administrative skill and tact in the cause of justice which it is not so easy for any architect to supply, but which cannot be supplied by any one else. In fact, in this, as in everything, it is experience, and not theory, that wins even the best case. In preferring to confine the inquiry so much as I have done to what is called the practice of the Courts and the administration of expert evidence, I do so because of what I consider to be the state of the law. The common law (of easements) may be clear enough; and the statute law (the Prescription Act of William IV.) may be equally so; but the efficient law of ancient lights is all case-law, and inasmuch as I may certainly say, as a practical man, that false issues abound everywhere, enveloped in the densest clouds of fallacious evidence and forensic mystification, it does not seem to me to be an over bold allegation to make, that the cases which we hear so often quoted are useless as a guide to architects, and worse than useless to the public, their clients. I believe there are few lawyers, if any, who will refuse to endorse this opinion. I therefore respectfully advise the Institute to leave the law alone, and agitate for nothing more than a proper adjustment of the practice and custom of the tribunals to the present conditions of building property.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE third of the series of lectures was delivered on Tuesday evening by Mr. David Barclay, F.R.I.B.A., the subject being "Architects' Specifications." The lecturer impressed upon the members the desirability of giving more attention to this most important subject, as the too common practice of contracts being entered into based on schedules of quantities drawn up from mere notes, in dependence on after measurements, is in some respects not so satisfactory as the more minute details given when lump sums were required. Clients in many cases were themselves to blame for this in not giving sufficient time between the approval of sketch plans and the issuing of the schedules. Mr. Barclay then read an example, taken from one of his own works, which entered most thoroughly and clearly into all the varied requirements of that particular case. At the conclusion the lecturer invited questions from members, and, having answered several, he was awarded a vote of thanks.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

A MONTHLY meeting of the Scottish Society of Antiquaries was held on Monday in Edinburgh. The Secretary announced that the Council had appointed the Rev. J. Collingwood Bruce, Newcastle, as the Rhind Lecturer for the ensuing session, the lectures beginning in October, and the subject, "The Roman Occupation of Britain." Mr. Cochran-Patrick, M.P., Vice-President, had, the Secretary intimated, sent a drawing of a cross-barred "yett" which he had met with at Dunlop. The first paper was a notice by Principal Tulloch, D.D., of some ancient vessels of silver belonging to the College of St. Mary at St. Andrews. The vessels, which were exhibited to the meeting, consisted of two chalices, the one $5\frac{1}{4}$ inches and the other $7\frac{1}{2}$ inches high, and each bearing inscriptions. The second paper was a notice by Mr. J. M. Dick Peddie, architect, of a crucifix of bronze, enamelled, found in the churchyard of Ceres, Fife. After giving an elaborate account of the characteristics of style and workmanship which distinguished the Byzantine, Rhenish, and Limoges schools of enamelled work, and comparing the peculiarities of this example with these, Mr. Peddie came to the conclusion that it may probably be an early specimen of the work of the Rhenish School, although it was not altogether beyond the bounds of possibility, if we knew more of the early Christian work of Scotland, that it might have been made there.

Dr. Anderson agreed with Mr. Peddie's conclusions, and remarked that the specimen was one of such interest and importance in a scientific point of view that he hoped it would be given to the national collection.

A paper on Holy Wells in Scotland was read by Mr. J. Russell Walker, architect, and it was illustrated by carefully executed drawings of the Rood Well at Stenton, Haddingtonshire; St. Peter's Well at Houston, Renfrewshire; St. Ninian's Well at Stirling; St. Catherine's Well, Liberton; St. Michael's Well, Linlithgow; St. Margaret's Well, formerly at Restalrig, now in the Queen's Park; the curious Holy Well at St. Andrews; and St. Mungo's Well in the crypt of the Cathedral at Glasgow. The dedications of nearly all the known Holy Wells in Scotland were traced, and instances adduced of the survival of the faith in their healing virtues down to the most recent times. One of the most curious of these was witnessed by the author at St. Anthony's Well a few months ago.

Mr. J. Romilly Allen described a sculptured stone at St. Madoes, Perthshire, with some notes on the interlaced ornamentation so characteristic of the Celtic monuments.

The next paper was an account by Mr. A. H. Millar of the discovery of two cinerary urns at Tayfield, Newport, near Dundee, in August last.

Mr. William Traill, in presenting to the museum some relics found in subterranean buildings at St. Tredwell's Chapel, Westray, gave a short description of the excavations made in the mould on which the chapel stands.

EDUCATION IN ART.

THE following communication from the Headmaster, Mr. A. G. Webster, was read at the annual meeting of the Lincoln School of Art:—

The two sides of artistic attainment—the power of drawing what is seen, and the power of original production—stand on a very different footing in their relation to the powers and the requirements of the mass of the people. To expect the power of original production, in a sense that would be worth anything, from any but a small minority of mankind, would be out of the question, even with the most perfect system of artistic instruction. Few men, either writers or artistes, have really original ideas; the majority among them who succeed to a respectable extent merely repeat previous ideas in a slightly modified form, with more or less of their own manner of execution; and even manner of execution is copied from others, consciously or unconsciously. Many works so produced may be very agreeable in themselves, and give legitimate pleasure, but they have no permanent value, and do not last beyond their own day. The power to produce even these, however, requires the same degree of technical instruction as is required to make a great and original artist; the training must be given to all who feel moved to seek it, the genius will show itself where it exists; training cannot evoke it, but can only furnish it with the power of expression. Even those, however, who can produce independent works, which are not characterised by originality of genius and of manner, are a minority in regard to the mass of mankind; at all events, this kind of power even is not acquired without almost entire devotion of time and energy to it, which cannot be given except by those who intend to live by it, or who are of independent means.

To the majority outside of these lines a training in art has another kind of value. It is a means of education, of calling out faculties of the body and mind which would otherwise lie dormant, of opening sources of pleasure in an intelligent appreciation of works of art—people who do not understand art practically almost

always admire bad things—and of giving, by means of the power of drawing, a more accurate perception of the forms of objects, and a capacity for representing and describing them in a manner far more direct and more universally intelligible than any written description can be. This practical value of drawing has been borne witness to by not a few employers of labour, who have given it as their experience that a workman who could draw and could properly understand a drawing was always more capable, more useful, and better able to carry out his instructions than one who could not. The practical value of drawing may be recognised, even apart from its operation on the understanding, in its power of promoting greater delicacy of manipulation in operations quite apart from that of drawing in itself. One of the best amateur artists of the day, as is well-known, is an eminent surgeon, who has declared that he first took up etching because it was a recreation which would have the effect of rendering his hand more delicate for his important professional work. One of the best remarks in regard to this result of training in drawing was one given by a lady who was a candidate for a School-Board election, and was asked, somewhat indignantly, by one of her working-class constituents, what was the use of teaching drawing in the Board Schools to girls who were going into service, for instance, and why their education was not confined to things that would be useful to them in their future life? The reply given was that there was no more common complaint against female servants than about their clumsiness in handling fragile things, such as glass and china, and their continual breakage of such articles in consequence; and that a training like drawing would probably do more to render the hands more safe, careful, and sensitive in touch than any other influence that could be named. Of course, it might have been said in addition that a knowledge of drawing would give a domestic servant even greater advantages than that, in providing her with a more interesting and sensible occupation for her leisure time than reading “Penny Dreadfuls.”

It is now recognised that learning to draw does not mean merely learning to copy on one flat surface the marks on another flat surface; in other words, making a drawing from another drawing, but that drawing means the power of representing on a flat plane any object or group of objects that is placed before the draughtsman, and that no one can be said really to draw who does not understand how to represent the outlines of any object, however complicated, by lines on a sheet of paper, put in, not by the lucky help of a natural quickness of the eye, which may at times enable a pupil to draw what looks right by a happy chance, but in accordance with a definite and scientific knowledge of the relation of appearance to reality, and of the method of representing this relation on paper. That is the one-half of the now recognised truth about artistic instruction, and the other and equally important half of it lies in the recognition of the fact that no study of nature at second-hand, from a “first,” “second,” or “third” drawing-book, can give real training in the knowledge of what nature really is, and of the beauty, delicacy, and infinite variety of natural forms; that nature must be studied seriously and zealously from her own realities, and not from copy-books; and hence that to draw one sprig or flower correctly from nature is more to the purpose, and teaches more, than to draw a whole landscape from a flat copy executed by another hand. The latter process neither teaches drawing nor teaches a knowledge of nature; it only teaches a trick of hand which can be mechanically repeated. The study of a fine landscape-painting by means of copying it has, of course, as far as it goes, the same sort of value in relation to the superior landscape-painter’s art which it has in relation to nature: it gives the student an insight into the manipulation of colours, and teaches him how the greater painter produced his effects, just as the study of nature herself teaches him how nature produces her effects, and how to reproduce them. But the modern system recognises that even the greatest landscape-painters’ work is only a translation from nature, not to be studied with a view of understanding nature herself, but with a view of understanding the painter and his method, and perhaps of learning from his work something about the way of studying nature, and the means by which some of her effects may be reproduced, and gaining some new hints to be turned to account in the student’s own studies from nature.

Probably the reform would be accelerated not a little if it were once fairly recognised that there is a practical value in the power of drawing for men who are in trade and commerce, and that it is not a mere elegant accomplishment for ladies and gentlemen. In public schools the mistake is that drawing is only voluntary. Few schoolboys are likely to do anything voluntarily in the way of work; and as drawing taught on the scientific method really is work and not mere trifling with brush or pencil, it may be surmised that only a very strong turn for drawing on the part of the pupil, or the direct orders from home on the part of the parents, lead to the filling up of the drawing-class. Among University men of the present day, from which class most or all of the masters at our large schools are recruited, there still linger the remains of the old superstition, that drawing should be an “extra,” somewhat like dancing; an elegant accomplishment, not to be put on a level with classics and history and other serious studies. The next generation of schoolmasters will probably know better themselves; to those of the present

generation it may be urged that drawing is a most important element in mental and bodily training, and that up to a certain point, that is to say, as far as concerns the practical handling of the pencil and the power of copying an object when seen, and of drawing in correct perspective anything which it is desired to represent—so far as this, drawing can be almost as certainly taught generally as writing, and ought to be so, as a part of every man’s education. The question of artistic feeling in the higher sense is a different one. It only exists at all in a portion, perhaps a minority, of boys; though a preliminary training in practical drawing might not infrequently bring out evidence of latent artistic taste, where it would never have shown itself or been suspected had not the capability for the expression of it first been imparted. The true solution of the problem for general schools would be a compulsory class, supplemented by a voluntary one. The elements of drawing, scientifically taught, should be as much a compulsory subject as grammar or writing; and when once this is established we should not have the curious spectacle, which we have sometimes seen, of great publishing firms, which would on no account publish bad and ungrammatically-written books, being quite willing, nevertheless, to publish books containing illustrations violating the first rudiments of the grammar of drawing and perspective, and seeing nothing to be ashamed of in this; and after the course of a few generations of compulsory teaching of drawing, people will read about the people who could not draw in the present day as we do now about barons and knights who could not write their own names.

WOOD CHIMNEY-PIECES AND OVER-MANTELS AT MESSRS. WELLS & CO, LIMITED.

It has often been remarked that the keen competition of the present day has a demoralising effect upon manufacturers, who to meet it are too often disposed to reduce the quality of their goods, in any manner that appears possible to them, so long as in outward appearance they can be made to retain somewhat of their former attributes. That this is correct in many instances we have from time to time ample demonstration; but, on the other hand, this same competition has given an incentive to the progress of art productions during the last few years that has perhaps not been observable to so great an extent in any period of our history. There are few articles in which this change has been so rapid as in domestic furniture and the *entourage* of the fireplace, while the desire to furnish the different rooms in even small middle-class houses may be instanced as showing an improved taste on the part of a large portion of the public.

Amongst the firms who have come prominently forward to elevate the taste of the masses in the latter class of furnishings may be mentioned Messrs. Wells & Co., Limited, of the Commercial Ironworks, Shoreditch, and 26 Queen Victoria Street, City. Only a few years since the profession and trade were in a manner startled by the handsome and extensive pile of buildings erected by this enterprising firm in Shoreditch, in which show-rooms were furnished with such a collection of grates, chimney-pieces, and articles of a kindred character, that were scarcely approached by any house in the metropolis. But although this large business establishment has no doubt answered the purposes for which it was erected, the East End of London was found to be rather too far from the great business centres to draw those persons in sufficient numbers who were likely to become purchasers of such high-class productions, and a few months since Messrs. Wells & Co. determined to add to their already extensive premises by opening a branch establishment in the City. No. 26 Queen Victoria Street was taken with that object, and for the guidance of those who may be desirous of visiting this *depôt* we may mention that, although the frontage is but small, and may be passed by an unobservant visitor, the interior is large, and is replete with an extensive and costly stock.

At the present time the firm are soliciting the visits of the profession and trade to an exhibition of wood chimney-pieces, over-mantels, &c., which are worthy of a careful inspection. The growing demand for these “furnishings” has led to this step, and, in the many examples they have brought together there is not one to which exception can be taken as to its design, which, following in the main the style of “Early English” and “Adams,” comprise one or two appertaining to the Chippendale, and others of æsthetic character. The woods of which they are composed are oaks, walnuts, and mahoganies, others being ebonised, and some of these picked out with gold. They range from those of the simplest character—and of mantel-pieces only—to others containing choice carvings and elegantly-arranged over-mantels. To attempt to describe any of them individually would be disappointing probably to the reader, as without illustrations it would fail to present a correct impression. Tiles are but sparingly introduced, and this we consider an advantage; but backings of embossed leathers and stamped velvets are utilized in the over-mantels with marked effect, panels of plate-glass with bevelled edges of various sizes adding much to the general effect of others. The carvings, wherever introduced, are sharp, clear, and well

executed, and the well-known festoon of flowers—so favourite a feature with “Adams”—is introduced in some, though it is not made too obtrusive a feature. We may observe that each of the chimney-pieces is embellished with grate, kerb tile-hearth, &c., which materially add to the general effect, and amongst the latter there are several very notable features. Thus a handsome ebonised mantel and over-mantel, of Chippendale character, contains a dog-grate, handsomely mounted with brass, the sides of the opening being composed of hand-painted tiles, representing in conventional treatment two figures—Sweet Idleness and Fair Industry.

Another suite represents an ebonized mantel and over-mantel relieved with gold, with an inlay of carved walnut panels under the mantel-shelf. An appropriate grate and a tile hearth, composed of only three slabs (which facilitates the laying and reduces the cost) in which a low toned green is prominent, interspersed with hand-painted flowers and sides to match, is one of the most attractive in the display.

A novel feature in connection with this exhibition are kerbs made of different woods, mounted with brass, and amongst those exhibited is one composed of real ebony. Presuming that this arrangement can be effectually carried out in practice, that is to say, if the wood can be relied upon not to warp with the heat of the fire—and we understand every precaution has been taken in their manufacture to guard against such a catastrophe—this innovation will, so to speak, prove the connecting link to the introduction of a suite of fire-place appendages formed of the same material.

Beyond what we have named the City show-rooms of Messrs. Wells & Co. contain a large assortment of grates of a cheaper class, kitchen ranges in all their varieties and architectural ironwork generally, and there are also some specimens of wrought-iron gates and palisading of their own manufacture of a commendable character. An extensive collection of gas fittings suitable for every description of house are also on show, as well as other specimens of brasswork, including balusters, newel posts, &c.

And here we may remark that there is a decided advantage to be gained in patronising Messrs. Wells & Co., in one particular at least. Although extensive manufacturers themselves, they do not profess to be makers of all the goods they display, but they make such selections from the productions of other makers as to render their stock diversified in style, design, &c., giving the buyer an opportunity of choice that he cannot expect to obtain from the collection of one manufacturer only. There are many that will deem this a privilege, and if they visit Messrs. Wells's City show-rooms within the next few weeks, they will be gratified with the display of wooden chimney-pieces, &c., which the firm have brought together for their inspection.

SMOKE ABATEMENT.

A MEETING of the Smoke Abatement Committee was held on Monday at Grosvenor House, for the consideration more particularly of the injury done by the smoke nuisance at Westminster to the Abbey. In the absence from town of the Duke of Westminster, the chair was taken by Mr. Ernest Hart, and in opening the proceedings, he drew attention to the extensive destruction of the surface of Westminster Abbey, which in some of its most important parts was approaching a ruinous state. The mischief was so serious as to call for the interposition of the Government. The authorities in charge of the Abbey were fully alive to this, and were taking steps adequate to the gravity of the circumstances. At one of the meetings of this institution, Mr. Shaw-Lefevre had stated that the cost of keeping in repair the surface of the Houses of Parliament was 2,500*l.* annually. The extent of the evil was increased by the nuisance arising from the excessive emission of smoke in the Lambeth district, and from the refusal or omission of the magistrates to inflict the penalties imposed by the Smoke Nuisance (Metropolis) Acts of 1853 and 1858, which expressly included potteries. When proceedings had been taken against the owners of such works and convictions obtained, magistrates had imposed merely nominal penalties of 2*s.* 6*d.* or 10*s.*, whereas, according to the Acts, the minimum penalty was 2*l.*, the maximum being 5*l.* for a first offence. Mr. Arnoux then explained the principles of construction of Minton's smokeless pottery oven or kiln, which was extensively used on the Continent and in Staffordshire, and which, as the report of the Smoke Abatement Committee (1882) showed, effected a saving of 40 per cent. in the fuel used. It was suitable for all kinds of pottery work. Mr. Hearne said the Westminster Board of Works were fully sensible of the gravity of the nuisance caused by the potteries in the neighbourhood, and had drawn up a memorial on the subject, which was to be presented to the Home Secretary. Mr. Ernest Hart said he was glad to learn from the last speaker that public opinion in Westminster was with the Board of Works. This institution had also prepared a memorial which had the support of the Duke of Westminster, the Duke of Northumberland, Lord Mount-Temple, Dr. Lyon Playfair, Mr. Hussey Vivian, Sir Frederick Pollock, and others, and which would be presented to the Home Secretary. Lord Algernon Percy, M.P., said that Mr. W. H. Smith, who was prevented from being present, would, as he himself should, support a movement to abate the nuisance of smoke, which was a public

and not a merely local question. Sir F. Pollock supported the adoption of the memorial. Captain Douglas Galton, having thanked the deputation from the Westminster Board of Works for their attendance, remarked that it was only by the action of the local authorities that the smoke nuisance in London could be diminished. Dr. Siemens said there could be no doubt, not only that furnaces suitable either for pottery firing, iron puddling, or other manufacturing processes could be constructed to prevent a nuisance from the smoke, but that such furnaces had been long in use and with a substantial saving and benefit to the manufacturer. The Chairman stated that the honorary secretary, Mr. W. R. E. Coles, as he held a public office, had thought it would not be right to attend a meeting in which individual cases were necessarily referred to, and after some other business the proceedings terminated.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the meeting of this Association, which was held on the 7th inst., Mr. MacGibbon being chairman, Mr. Andrew Dewar read a short paper on “Architectural Sky Lines,” in which he expressed as his opinion that greater attention should be devoted by architects in their treatment of roofs and chimney-stalks. Mr. MacGibbon offered some remarks on Dunblane Cathedral, in the course of which he referred to the peculiarities of the edifice in construction and design. This paper was illustrated by a series of careful drawings prepared by Mr. Robert Watson. A paper entitled “Notes on Rubbings from Iona,” which had been prepared by Mr. Thomas Leadbetter, late of Edinburgh, now of London, was communicated by the President. Votes of thanks were awarded to the speakers and Mr. Leadbetter.

HUDDERSFIELD FINE ART AND INDUSTRIAL EXHIBITION.

DURING the coming summer a fine art and industrial exhibition will be held at Huddersfield in connection with the opening of the new technical school. In the year 1840 a Mechanics' Institute was founded at Huddersfield, and the Committee almost immediately directed their attention to the formation of classes for instruction in designing, chemistry, and a little later dyeing, weaving, and mechanical engineering. In addition to these there were science, art, and elementary classes. The institution made steady progress, and it was found necessary in 1843, 1849, and 1861 to make successive removals to larger and more commodious buildings. About four years ago the Huddersfield Chamber of Commerce considered the advisability of establishing a technical school exclusively, but seeing that the work had been carried on successfully by the Mechanics' Institute Committee in conjunction with other departments of study, it was resolved to form a joint committee from the two bodies to take in hand the erection and furnishing of a much larger building adapted to all the requirements of the present work of the Institute, and especially providing for the development of the technical department. This has now been done, and the formal opening will take place in June next, when it is expected that a member of the Royal Family will honour the borough by a visit. For the promotion of the fine art and industrial exhibition which will inaugurate the opening a large and influential committee has been appointed. A fund of 2,000*l.* for guaranteeing the expenses was asked for, but the amount actually subscribed now stands at 6,500*l.*

LLANDAFF CATHEDRAL.

A PAPER by the Rev. E. A. Fishbourne, on the “Cathedral Close at Llandaff,” was read at the last meeting of the Cardiff Naturalists' Society. The paper dealt chiefly with the probable aspect and condition of the Cathedral and its neighbourhood in early days. The chapter at Llandaff existed in its present form before the time of Henry VIII. The Cathedral was wanting in those picturesque conditions which lent so much interest to other cathedrals. It had a chapter-house, because that was the place in which most of the business was transacted, but that was added in a very plain manner; there were no cloisters, Llandaff being too poor for that. There was one thing which must have been pre-eminently picturesque about Llandaff, and that was the beautiful slope which divided the Upper from the Lower Close. There were at the time no houses except that of Mr. Waldron near, and part of the present house had no doubt existed for several centuries. Reference was made to the great campanile or tower, which rose just midway along the verge of the slope, and within which Great Peter, a bell of five tons in weight, hung, which at present was suspended in Winchester Cathedral, and for which the bishop gave five other bells. It was said that under a field then called Llanyrach was situated the house of the archdeacon, which must have been quite a castle, being 144 feet long and 60 feet broad. Many interesting facts with regard to the prebendal house were noticed by Mr. Fishbourne, who disclaimed all pretensions to bringing any new facts to light, and should have been glad if he had been able, by reference to the old records at the Cathedral to point out the precise spots in which the prebendal houses stood

NOTES AND COMMENTS.

PUBLIC authorities in this country find little difficulty in setting aside arrangements which have been made with architects, and the latest example of this policy is the competition for the new Museum in Dublin. It was guaranteed by the Government that one of the five architects who were most successful in the first competition should be entrusted with the execution of the building. But if the reports of the interview which took place on Monday between the Lord-Lieutenant and a deputation are to be accepted as correct, there is to be a new competition, and in addition to the Museum there will be a National Library, or two buildings instead of one, as originally proposed. The five competitors whose plans are now before the authorities will thus be set aside. They will have to be compensated, but nothing can atone for the wrong that has been done to them. It may be said that the conditions of competitions are often altered, and the case of the Glasgow Municipal Buildings is adduced as evidence. But the Glasgow Council did not promise in the original conditions that the author of the selected design was to carry out the building. This was done in Dublin; but it is evident that a Government guarantee is valueless against a political move. If the authorities believe that they are likely to pacificate Ireland by means of a new competition, they are mistaken. They have succumbed to clamour, and what is the gain? Having achieved a victory another is anticipated for, as a Dublin paper, which is owned by one of the deputation, says, "If the Museum were to be built of diamonds, and its control and management vested in the South Kensington officials, its value to the Irish nation would be the selling price of the building materials and nothing more."

It is remarkable that at the present time, when the necessity of drawing and design are so apparent, complaints are heard about the financial difficulties of art schools. In Manchester the debt amounts to a large sum. In Sheffield if the debts are low the condition of the school is defective. Mr. MUNDELLA, on Monday evening, said he sent an officer of the Department to report upon the Sheffield school. He was informed that the school was doing excellent and creditable work, but it was not well furnished or comfortable. Mr. MUNDELLA said he should like to see the building cleaned from top to bottom, heated and ventilated, and casts and other examples supplied. In order to overcome the apathy of the rich manufacturers of Sheffield, he offered 50*l.* if nine gentlemen would each give a similar sum. Only three accepted the challenge at the meeting.

THE railway bridge over the Thames at Blackfriars is to be widened, and it is understood that the additions will be on the western side. Already the bridge is too close to the new Blackfriars Bridge, and in no other city would so plain a structure be allowed to exist in so prominent a position. But if the railway is brought about 15 feet closer to the bridge the appearance of the place will be destroyed. The company have always very large and hideous placards of canvas on the girders which in some positions obscure the view of St. Paul's from people on the bridge; but if they are used on the additional girders, as they are sure to be, much else which is worth seeing will become invisible. There is a fatality about the London, Chatham and Dover Railway, for wherever it goes people may say farewell to the picturesque. We had no better street scene in London than Ludgate Hill, but there was an end to it when the railway bridge and those surprising cantilevers which hang from the girders were thrown across the street. In the country it is the same, as may be seen if the Ramsgate sands of to-day are compared with the view represented in Mr. FRITH's picture.

It was announced last week in a literary journal that henceforth the Royal Academicians had agreed to limit the number of works to be exhibited by each member to four. But the statement has been contradicted officially. There is a notion abroad that the Academicians take full advantage of their privilege. Some do, but on the whole the number of works seldom reaches four for each member. Last year seventy members—Academicians and Associates—contributed in all 204 works; an average of less than three a piece. One member contributed eight works, two seven, one six, seven

five, sixteen four, twelve three, sixteen two, nine one, and six naught; so that only eleven members, of whom three were sculptors, contributed more than four works.

MR. POWELL, the President of the Scottish Society of Painters in Water-Colours, suggests the necessity in the National Gallery for a separate gallery for the water-colour pictures and drawings belonging to the nation, which are now so unfortunately treated for lack of suitable rooms. This hiding of masterpieces of water-colour art is the more to be lamented, because no other country has such treasures in a medium in which we pride ourselves on being pre-eminent. A scheme that would give our water-colour pictures a place where they could be well and easily seen would do much to enlarge a love for that beautiful branch of art which is associated with the names of our most celebrated British landscape artists, and would doubtless induce valuable donations which would eventually give a prominence to our National Water-Colour Gallery among the galleries of the world. The public may be assured that the comparative neglect of water-colour painting in Trafalgar Square is not due to the director of the gallery. Mr. BURTON is one of the ablest of water-colour artists—but the National Gallery is a Government institution, and, like others, is bound by old-fashioned regulations.

THE Committee of the Society for the Protection of Ancient Buildings have heard that the Ponte Vecchio in Florence is shortly to be pulled down, on the ground that it is unsafe, and in danger of being carried away by the Arno. Mr. MORRIS accordingly pleads for its preservation on account of the unrivalled historical interest and artistic beauty of the bridge, with its three graceful arches crowned by a picturesque group of houses, over which is carried the long passage connecting the Pitti and Uffizi Palaces. Not only the arches of the bridge, but portions of some of the houses are still preserved exactly as designed by TADDEO GADDI, and built in A.D. 1362—an object of the greatest beauty, both when seen close at hand and as one of the chief features in the glorious distant view from San Miniato. No doubt some careful engineering work is required to save the bridge, the foundations of which have been seriously undermined by the scour of the stream; but it certainly would not be beyond the skill of modern engineers to underpin and secure the failing piers.

THE exhibition of the works of the late HABLOT K. BROWNE, which is now open at the gallery of the Liverpool Art Club, reveals the power he possessed in oil and water-colour painting, although it was not appreciated by the public. Some of his etchings to stories made it plain that his best work was not necessarily the representation of the grotesque, or of exceptional specimens of humanity. "Phiz" was equal to the production of tragic and impassioned scenes if opportunities were given to him. There are works of this kind at Liverpool. One painting shows two Fenian Kings, who have pierced one another with their spears, and their horses are masterless. The background is in harmony with the event. The subject of another painting is taken from BOCCACCIO, and shows the vision of ANASTASIS, who saw a woman pursued by dogs in revenge for her cruelty. Mr. BROWNE was skilful in drawing horses, as is evident from illustrations of LEVER's romances, and at Liverpool there are several examples. One is the Phorca, the wild black horse of the Irish legends; a second is a wearied horse that has galloped home from the battlefield. Another phase of his art was the delight in children, and it is exemplified in many drawings. The exhibition is deservedly the most popular of those which have been organised by the Art Club.

THE new buildings for the Calcutta International Exhibition, 1883, adjoining the Imperial Museum, are now being erected under the superintendence of Col. the Hon. S. T. TREVOR, Royal Engineers. The general and executive committees include the Governors of the Presidencies of India, the foreign Consuls, and the Princes and Rajahs of Bengal. Lord RIPON has recently sent a cable message to Earl KIMBERLEY requesting that all due publicity may be given to the Exhibition. Invitations have been sent throughout India to all the Rajahs and Princes, inviting them to contribute to the Indian display, which is to be on a grand scale. The machinery department is expected to attract much interest. The Exhibition will be opened on December 4.

THE MERCHANTS OF FLANDERS DEPOSITING THE

[WALL
BY M. G.

17th 1883.

CHARTERS AT ST MICHAELS ABBEY, ANTWERP.

TING.)

UFFENS.

VIEW OF PADDOCK
SHEWING AD
ARTHUR CAWS

The main illustration is a perspective view of a large, multi-story stone building. On the left, a prominent tower with a conical roof and a small spire is visible. The main body of the building has a steeply pitched roof and a large, ornate chimney. The walls are made of rough-hewn stone. A stone wall runs along the front of the building, with a gate on the left. A path leads from the foreground to the gate. The foreground is a grassy area with some trees and shrubs. In the upper right corner, there is an inset diagram showing the 'Ground Plan' of the building. The plan is a complex of rooms and courtyards. Labeled rooms include: Kitchen, Store Room, Stable Yard, Cook's Room, Hall, Dining Room, Parlor, and several smaller rooms. A central courtyard is labeled 'Cour. Yard'. The plan is titled 'Ground Plan' and includes a scale bar at the bottom.

ILLUSTRATIONS.

FLEMISH MERCHANTS AT ST. MICHAEL'S ABBEY, ANTWERP.

WALL-PAINTINGS by M. GUFFENS are found in many of the public buildings of Belgium, and one of the principal, *The Entry of Philip the Bold*, has already been illustrated in *The Architect*. The work we copy this week shows the Deans and Merchants of Flanders depositing their charters and privileges in the Archives of St. Michael's Abbey, Antwerp. Just as in other works by M. GUFFENS, strength is gained by the upright lines of columns, furniture, and paneling, as well as by the rigid lines of the drapery. Having so extensive an experience in mural painting, the artist is aware, not only of the differences between decorative works and ordinary easel pictures, but of the qualities which produce the most effective results.

VIEW OF PADDOCKHURST, SUSSEX.

THE principal additions to this house consist of the large *salon* (an interior view of which we hope soon to illustrate), the *porte-cochère*, with the rooms immediately behind same, and the kitchens. In the perspective these form the principal objects, and they entirely alter the appearance of the building from this point of view. But it will be seen from the plan that these are comparatively small additions compared to the whole building.

The mansion was designed and erected about twenty years ago by Mr. ANTHONY SALVIN, F.S.A., and the additions are now being made for Mr. ROBERT WHITEHEAD. The builders are MESSRS. TROLLOPE & SONS, and the architect Mr. ARTHUR CAWSTON, of 9 Spring Gardens, S.W.

SHOPS AND OFFICES, NO. 57 BASINGHALL STREET, E.C.

THESE premises, which are just completed, occupy an area of 1,660 feet, and have a frontage to Basinghall Street of 34 feet. The upper part is fitted up for offices, and the ground-floor and basement for warerooms or shops. The building, which is externally of a Flemish character, has been erected from the designs of Mr. RICHARD M. ROE, A.R.I.B.A., of 140 Leadenhall Street, E.C., at a cost of 4,000*l.* LASCELLES' red concrete has been used for the dressings, the spaces between being rendered with Portland cement in one coat, finished smooth with a view to being eventually painted white. Red concrete has also been extensively introduced internally, the stairs, chimney-pieces, and dados being of this material. Each room in the building is separately ventilated by a tube 8 inches square, connected with the exhaust-ventilator on the roof, fresh air being admitted by an inlet of the same size passing at the back of the stove in each case.

The contractor is Mr. J. GROVER, of New North Road. The carving is the work of MESSRS. DAYMOND & SON.

VILLA AT DORKING.

THE house shown in the illustration was lately erected from the designs of Mr. CHARLES BELL, F.R.I.B.A. Although sufficiently commodious, the cost has been only about 1,050*l.*

THE NEW LAW COURTS.

A COMMITTEE of the Senior and Junior Bar practising in the Chancery Division have been recently considering whether, in the light of the experience gained by a month's actual use, any and what improvements are desirable and practicable in the new Law Courts assigned to that Division. The result is that a memorial was forwarded on Saturday last to the Lord Chancellor, which during the previous three days had been signed by all the Queen's Counsel usually practising in the several Courts of the Chancery Division, and by a very large number of the juniors. The memorial suggests certain alterations in these Courts which the memorialists consider advisable, and which they believe will better adapt them for the transaction of business, and will conduce to the comfort and convenience of all who have to use them. The most important of these alterations are the substitution of narrow tables covered with cloth, and continuous seats similar to those in the old Lincoln's-inn Courts, for the sloping desks and separate seats at present arranged for counsel; the adoption of means for facilitating communication between counsel and those instructing them; the removal of the heavy inner doors, the swinging of which, with the accompanying admission of noise from the resounding corridor, is at present the source of so much annoyance, and the substitution for them of curtains, so as to constitute a small lobby between each Court and the corridor, thereby making it less difficult for Judges and counsel to hear and be heard; and an alteration of the backs of the Courts, in order to allow persons to pass from one side to another without going out into the corridor.

THE POSITION OF ORGANS IN CHURCHES.

Concluded from page 98.)

IT is now customary to place the organ in a chamber at the side of the chancel. I find that this arrangement is almost universally condemned by musicians, and especially by organists. A correspondence upon the subject has recently taken place in the *Musical Standard*, and the veto was strongly against these structures. A very eminent organist lately told me that it was about as bad a position as could possibly be found for an organ, and for his part he would as soon see the organ placed out on the opposite side of the street. I will here relate the objections to organ-chambers which I have heard advanced. (I am not now giving you my own opinion, but that of those who are far more able to judge of the matter.) It is advanced that an organ, like all other musical instruments, requires to be placed in an open and isolated position, and that it should never be enclosed or surrounded, except by its own case. We know that when a good pianist wants his instrument to sound well, he draws it away from the wall, and opens the top, so that there shall be nothing to intervene between the instrument and his audience. And it is even more important that an organ should be unencumbered by surrounding objects than a piano, because the organ consists of at least two parts or subdivisions, the most important of which is called "the great organ," and the less important "the swell organ." Now the characteristics of "the great organ" should be power, grandeur, and distinctness of tone; and the "swell" should be more subdued, sweet, and gentle, with a contrivance for producing variety as to *piano* and *forte*. The contrast between the various portions of an organ form one of its greatest merits as an instrument, and these contrasts are effected by certain mechanical means. The "great organ," for instance, demands a clear space to give forth its majestic tone; the "swell" requires to be enclosed, but to be able, when wanted, to break away from this enclosure, and give forth a fine *crescendo*. This is effected by a contrivance somewhat resembling Venetian blinds. If there is a choir organ it should be clear, delicate, and very sweet in tone. Now, when the whole thing is shut up in a box—and an organ-chamber is really little else—much of this wonderful contrast is gone, because the very conditions demanded by the instrument are unfulfilled. But some people may say, "Oh, I like the subdued tone of the organ, and cannot bear to hear it when it is loud." An unfortunate organist wrote in the *Musical Standard* a few days back, that he was absolutely forbidden by the clergyman to play anything but soft voluntaries on the instrument, and was ordered not to play Bach's fugues, because the same clerical authority considered them "undevoational!" Now, to such people as this what I should say is, "Why on earth go to the expense of a powerful organ, when for 8*l.* you can get a harmonium which will be better suited to your taste, or want of taste!" It is surely folly to pay for grandeur of tone and power, and then shut them up in a box where they cannot be heard. Yet this is very frequently done. I have often heard really good organs crammed into organ-chambers, which have, from their unfortunate position, had little more effect than a harmonium. Sometimes, to make matters worse, the organ-chamber will be enclosed by low arches, and screens of wood or stone—all forming a carefully-constructed sound-trap or gag. The fact is, that when an organ is placed in an organ-chamber the "great organ" is reduced to becoming a "swell organ," without the power of producing *diminuendo* or *crescendo*. As a rule, also, organ-chambers are far too small to hold an efficient instrument, and the various parts have to be crowded together, and this is always bad. Mr. E. Turpin, the eminent organist, writing in the *Musical Standard*, gives 20 feet by 20 feet by 20 feet as the smallest sounding space for a church organ; yet how few organ-chambers are of these dimensions. Another defect in organ-chambers is the fact that they are nearly always damp. Now, damp is sure ruin to an organ. Then, also, an organ is difficult to get at when blocked up in a chamber. It is most important that every part of an organ should be easy of access, otherwise it may be absolutely necessary to take down nearly the whole of an organ to remedy some trivial defect, which an organist himself could easily rectify if he could obtain access to the part of the instrument where the defect lies. The great organ at Bois-le-Duc is admirably arranged in this respect, being furnished with a staircase and galleries inside.

From an artistic point of view much has been lost by the organ-chamber, which is nearly always an ugly adjunct to a church. Directly organs are relegated to the chamber they no longer come under the attention of the architect, and that singularly beautiful article of church furniture, the organ-case, is abandoned. But as long as the organ occupies an important position in the building, the case must be carefully designed; and when one sees how magnificently the Medieval and Renaissance men treated that architectural feature, one cannot help wondering why it so rarely receives any attention at the present time. There are, I am glad to say, some few exceptions, and fine cases have been erected at Worcester, Hoar Cross, and Manchester, and have been designed for St. Margaret's, Westminster, and St. Martin's, Brighton. It is, however, very strange that, as a rule, the only portion of an

organ which it is attempted to decorate are the pipes. This is certainly a work of supererogation, because the pipes of an organ are sufficiently handsome in their natural condition; whereas the deal posts and matchboarding which generally do duty for a case would certainly be none the worse for what our Yankee cousins call "a lick of paint." If people are very rich and anxious to spend money upon an organ, they should have the pipes embossed. One paints iron to prevent rust, but it seems repugnant to one's feelings to paint tin. I do not, however, propose to detain you by remarks upon the artistic treatment of organ-cases, because this subject is dealt with in a very complete manner by Mr. A. G. Hill, who, in his work upon the organ about to be published, has illustrated and described all the most important examples at present existing in Germany, Holland, Belgium, France, England, and some few even in Italy and Spain. Most of these are reproduced from Mr. Hill's own sketches. By rare good luck Mr. Hill has also become possessed of many curious engravings of old organ-cases now destroyed. To the artistic value of the work he has been able to add much practical information gathered from personal experience as a partner in the well-known firm of Hill & Sons, which is, I believe, the oldest firm of organ-builders in England.

I now come to the question, What is the best position for an organ in a church? And in consulting several eminent organists I have nearly always received the following reply to the question:—"Either some central position, as much isolated as possible, or a western gallery." Now the objection to a western gallery is that, although it is admirable for sound, people, and especially the clergy, are opposed to having the choir so far removed from the altar. But I venture to think that the central position might be managed. It certainly suggests a choir-screen of some kind or another; and why should not the choir-screen be constructed in the form of a solid arch or bridge crossing the eastern bay of the nave? This need not occupy any space upon the ground floor of the church, because the nave benches might be continued under it to its eastern extremity, or the choir might be carried on to its western extremity. If the first plan were adopted, the organist would sit in the gallery above the arch; but if the latter were carried out, he would play from the west end of the choir-stalls, under the arch. I have ventured to show how this arrangement might be carried out. It may be objected that this scheme gives very great prominence to the organ. But I would ask, Why should not an organ occupy a very prominent position in a church? It generally costs more than all the rest of the church furniture put together. It is, as I have shown, becoming every day a more and more important adjunct to divine worship. It is capable of the highest artistic treatment and architectural development. Why, then, should it not be brought boldly forward and placed in a situation worthy of the king of instruments? In the Middle Ages the organ was regarded with the most extraordinary reverence, and we find St. Peter Damian, in his exquisite hymn, enumerates the tones of the organ amongst the joys of heaven. Now it so thoroughly describes what an earthly choir ought to be that I venture to quote it:—

Novas semper harmonias,
Vox meloda concepat;
Et in jubilum prolata
Mulcent aures organa.

(Lovely voices make a concert,
Ever new and ever clear;
And in never-ending festal
Organs soothe the ravished ear.)

Mr. F. E. EALES then read the following communication from Mr. H. H. Statham.

Mr. STATHAM wrote: In regard to cathedrals, I think the formerly usual position of the organ, on the screen between the nave and choir, was the best both for architectural effect and for the effect of the instrument, as long as the organ was of moderate size, and as long as the choir was practically the church, or when the choir and nave were not used simultaneously for worship. I do not think that position of the organ was at all detrimental to architectural effect—rather the contrary. There is now, however, a growing feeling in favour of uniting the choir and nave, or having only a light open screen between, which necessitates the removal of the organ from that position; and the greatly-increased size of modern organs would render it impossible to plant the whole of the organ on the choir-screen in any case. Under these circumstances, I think a cathedral organ is best placed with the lighter portion bracketed out from one wall of the choir, and the heavier portion placed in the choir aisles, behind a screen; but the pipes must be concentrated, not scattered about as if they were playing at hide-and-seek in the choir aisles, as they are in one cathedral I could name; that takes away all the unity of effect of the instrument. The organ itself would sound better all built up in one case in the transept, but that is too far from the choir to blend with them or keep them properly in time. The best of all arrangements for a cathedral would be a small organ in the choir to accompany the choristers and a large nave organ, either at one side or at the west end, to lead congregational singing: and with the present means of electric action the two could be brought under the control of the same player. For parish churches, I think there is no

question that the best position for the choir in reference to the congregation, is the usual one, standing sideways and divided for antiphonal singing. The old west-end position of the choir placed them *behind* the congregation whom they were to lead, which was unsuitable, and to place them facing the congregation at the east end, though the best position musically, would be at variance with the idea of the simultaneous worship by choir and congregation, as well as placing them with their backs to the officiating priest. That being taken as settled, there is at present no place for the organ except in the chancel aisle or organ-chamber, which, as generally constructed, is simply fatal to the effect of the organ. The organ *must* be near the singers, however, and the bad effect of the organ-chamber may be lessened by making it much higher than is usually done, and by sinking the floor so as to get the bellows and the lower part of the pedal pipes below the floor, and the wind-chest on a level with the floor. The pipes will then have more space over them, and the sound will develop and get away better. In the usual low organ-chamber we generally hear a great noise close to the organ, a large proportion of which does not get into the church at all. I consider, however, that all the difficulty arises from the faulty plan of our churches, and that reform should begin here. The adoption of the long chancel in which the choir are placed is not only impractical, as being the worst possible for the effect of the choir, but is, even from the point of view of orthodox precedent, without any reason for its existence. The long choir came into use in the latter days of the Mediæval church, when the clerical body and their subordinate functionaries became very numerous, and required the lengthened choir to accommodate them all. They chanted the service, but they were shut off within a choir and behind a screen, *not* as chorister, but as *clergy*. In the present day there is no such large body of clergy connected with any church; the choir, whether paid or amateur, is a lay choir, and is properly part of the congregation, whose service of praise it is supposed to lead. But the choristers, who are no longer clergy, are packed into a long narrow chancel, where they cannot be properly heard, necessitating also a most ineffective position for the organ, merely because such a position was once considered correct at a time when the clergy were themselves the choir. I cannot see that, even on the most orthodox High Church view of the matter, there is any reason for this arrangement. Let church builders return to the basilica plan, which was for centuries the accepted church plan, and which is exactly suited for our modern service—the plan with the short chancel for the clergy and the altar, and the nave for the congregation; let them place the choir in the front portion of the nave (only seated sideways), forming, as they should, part of the congregation, and place the organ in a shallow transept adjoining them, and we should hear no more about the difficulties of placing the organ, &c. The whole difficulty arises from retaining, for a lay choir, on a mistaken idea of precedent, a form of plan intended originally to accommodate a numerous clerical body which no longer exists.

The President, Mr. E. G. HAYES, in opening a discussion, remarked that Mr. Brewer had treated the subject in a most exhaustive manner. The whole question seemed to him to be chiefly one of sentiment and ritual. From an organist's point of view the position for an organ indicated by Mr. Brewer's sketch was probably one of the best, notwithstanding that Mr. Brewer had passed so much praise on the position of the organ in the apse at Ratisbon, where a small instrument was as effective as a large one. In the construction of an organ-chamber the great thing to aim at, he supposed, was height, with walls made of resonant materials, giving as far as possible a curved form to the walls and roof. Mr. Brewer, he thought, objected to the plan of dividing an organ; but this arrangement of the organ at All Saints, Margaret Street, seemed to work well.

Mr. J. A. GOTCH, who proposed a vote of thanks to Mr. Brewer, said that however fascinating the drawing appeared, he should be sorry to see all churches with the organ over the choir screen. It seemed to him that an unbroken vista from east to west was far more awe-inspiring than arrangements which cut it in two. It was, however, perhaps a matter of taste, and the organist would naturally not object to such a position, though it obstructed the vista. The west end certainly seemed to carry with it the sanction of antiquity, and from æsthetic reasons he desired to raise his voice against placing the organ in the centre of the church. The question was one, however, for experts to decide upon. In some remarks on the singing—which not unfrequently was far from first-rate—Mr. Gotch advocated female voices and professional singers, which he preferred to boys' voices unless they were exceedingly well-trained. In congregational singing there was the objection that persons joined in under the impression that they were singing. It was annoying to listen to the person next you doing what he supposed was singing tenor.

Mr. W. A. PITE seconded the vote of thanks, and remarked that he had visited Ratisbon last summer. The music and singing, he said, were simply superb.

Mr. F. FARROW agreed in the desirability of introducing female voices, but thought that boys' voices could not be dispensed with were it only for the sake of contrast, and to give full effect to the choral singing. Mr. Brewer had anticipated greater difficulties in the future by reason of the gradually-increasing size

of organs. Not only would provision have to be made for enormous organs, but the clergy, who showed a great disposition to combine instrumental music with the organ, would insist on provision being made also for this. As to the position of an organ he was inclined to agree with Mr. Statham's proposal to place it in a shallow transept.

Mr. H. W. PRATT thought that as architects they were more concerned with the position of organs in parish churches than in cathedrals. In Nonconformist churches there would not be so much difficulty as in churches of the Establishment. If the chancel were made wider the organ could be placed on one side. It was much to be regretted that they should have to look forward to greater prominence being given to organs, or to an increase in their size, for he considered a great deal more money was already spent on them for the size of the building than was necessary. Moderation should be used in this respect, and, while the organ must be placed somewhere in the church, it should not be made a god of.

The PRESIDENT then put the vote to the meeting, and it was carried unanimously.

Mr. BREWER, in replying, said, with regard to the scheme which had not found favour in their eyes, he had simply worked it out because it had been suggested to him whether an organ could be put in that central position. His notion was to see how the suggestion would work, and how to make it as little an obstruction as possible. He did not know that it would be the best position as regarded church requirements, but from a musical point of view he considered it would be a good position. He agreed with Mr. Statham's views except as to placing the organ in a transept. A large organ often occupied a space of 20 feet by 20 feet and 40 feet high, which would necessitate a large and lofty transept; in addition to which the side walls should never touch the organ, as the organ was then enclosed on three sides, and the only part of the organ that could speak out would be the front; none of the pipes further back could. This was one reason for suggesting the placing of the organ on the screen, so that both back and front of organ would be clear of walls. With regard to the objection made against congregational singing, Mr. Brewer said that from the earliest times there were two kinds of singing—choir and congregational singing. Anyone who referred to the old plain chant would find the hymns and psalms were so simple that they could be picked up at once. The antiphons and anthems were exceedingly difficult, and while the congregation were expected to join in hymns they certainly were not expected to join in the anthems. It had been suggested that the placing of the organ on the chancel screen prevented the congregation in the nave hearing the voices of the clergy. He had, however, on one occasion, when shut in the nave of Westminster Abbey, heard most distinctly every word uttered by the clergyman. With regard to an open vista from east to west, the idea, however fine, had never suggested itself to mediæval architects, who, on the contrary, cut up the churches, so that the observer had to use his eyes a little to see all that was to be seen. The question of female voices was hardly an architectural question. They were good for solos, but the choruses sung by boys were infinitely finer than Italian opera. As to dividing an organ, he considered it was an unwise plan, for it added enormously to the expense of the instrument, and, secondly, the two parts must be connected by trackers passing underneath the floor of the church. It was important that every part of the organ should be accessible, whereas if a cipher took place it was quite possible that the whole of the floor would have to be taken up. The organ when divided would, moreover, be subject to a different set of draughts, and consequently get out of tune quicker, besides which they ciphered a great deal worse than other organs, and the action was extremely heavy except where the pneumatic action was applied. The pneumatic action sounded extremely well, and did well at such places as the Albert Hall, where you had the services of a large staff of men ready to rush about and put things right, but he had no hesitation in saying that every pneumatic organ would cipher in the weather they had that day. With regard to the use of an orchestra with an organ, brass instruments could be imitated perfectly on the organ, and need not be provided for; it would only be necessary to think of stringed instruments, the effect of which could not be produced on an organ.

THE CHURCH OF ST. CRUX, YORK.

AT the last quarterly meeting of the City Council of York, the Town Clerk laid before the committee the following communication, which he had received from the rector of St. Crux, viz.: "61, Monkgate, York, January 5, 1883. Dear Sir,—We, the undersigned, being certain that the fabric of St. Crux (west end) is showing further signs of a collapse, and knowing that a considerable time must elapse before the necessary preliminaries for the proposed restoration can be carried out, therefore beg you to bring the matter at once before the Council, so that some steps may be taken for the safety of the public." (Signed by the rector and churchwardens and eight parishioners of St. Crux.) It was resolved: "That the City Surveyor do inspect and report upon the

condition of that portion of St. Crux Church mentioned in the above communication." The City Surveyor reported that, as requested by the committee, he had inspected St. Crux Church during the past week. He was of opinion that the pillars, arches, and clerestory walls at the sides of the nave were more out of perpendicular than when he inspected the fabric about a year ago, but he could not perceive that any alteration had taken place in the tower since that time. He further observed that whilst in his opinion there was no immediate danger of the falling of the church, yet, considering its present condition as a whole, it was very desirable that the church authorities should take steps to pull down the building, or make such alterations thereto as they might desire, so that a misfortune might be prevented. It was resolved: "That a copy of the above report be forwarded to the rector and churchwardens of the parish of St. Crux, and that they be required forthwith to take all necessary steps to secure the fabric of the church."

MESSRS. DOULTON'S EXHIBITION OF CERAMIC GRATES AND STOVES.

THERE is to be seen at the present time, at No. 9 Conduit Street, Regent Street, such a collection of glazed ware, fire-places, and stoves, the productions of Messrs. Doulton, that it has hitherto been impossible for the eye to examine, for the reason that they are, so to speak, an innovation in fire-place decoration, and represent the first and only set as yet introduced upon so large a scale to public gaze. After the now celebrated Doulton Ware became popular, by which the firm secured probably an imperishable name, other art productions emanated from their *ateliers* in quick succession, and it is but a very few years since that the finely-glazed radiating close stoves made their appearance. The novelty was not in the fire-receptacle itself, for fire-clay has been used for a long period in this direction, but in the ornamental outer casing, which exchanged the black, and often dirty-looking, iron exterior for a cheerful looking coloured surface of pottery-ware, clean and pleasant to the touch. That the "new departure" was one in the right direction has been proved by the large quantities that have been sold. This has spurred the firm to further exertions, the outcome of which was seen at the late Smoke Abatement Exhibition at South Kensington, but it has been reserved for the present Exhibition in Conduit Street to impart to us the feasibility of introducing open grates of glazed ware, possessing the best features of our present style of iron grates, and at prices that may be said to compete with the latter, when brought into competition with any having pretensions to beauty or artistic worth.

Next in order to the close stoves come those of similar character with open fires, and in these the only iron work is the bars, which are loose, that is to say, they take off for cleaning purposes, merely dropping into sockets made to receive them. These in most instances are in self colours, rich browns and malachite greens being the most popular, and a pretty little example is shown of a small stove fitted for burning gas with asbestos clinkers, though it is almost unnecessary to add that any of them can be so utilised if required. The designs of these stoves are all of an artistic character and follow the prevailing fashion, many of them being decidedly æsthetic in character. They are so constructed that with the assistance of air ducts, a constant circulation of heated air is kept up over the exterior of the fire back, which abstracts the heat previously absorbed by the burning fuel.

The greatest interest will, however, be taken in the open grates, for judging from what Messrs. Doulton and Co. have brought together for our notice, it is for the introduction of this class of grate that the gauntlet has been thrown down by the firm, and the manufacturers of our ordinary grates will find they have powerful competitors to deal with. Although composed of seven different pieces they are easily fixed, and when complete differ little in outline from an iron grate; but there the similarity ends, and although tiles enter so extensively at the present day in the *ensemble* of our grates, clay offers such advantages in the elaboration of design that the superiority in the general *contour* will be acknowledged by the majority. The fire is in all placed upon the hearth, with this exception, that a slab of fluted fire clay forms the base, which allows sufficient air to be admitted underneath, as well as through the iron bars in front, to promote combustion, and the position in which the fuel is disposed insures the greatest amount of heat to be diffused over the apartment, and the least quantity to escape up the chimney. From the great thickness of the clay there is little chance of the material chipping when set, and it may be safely asserted that they are as durable as iron ones, besides their other advantages. As a whole the designs of these grates are elaborate in detail. Some are in tracery, others raised or in relief, self colours predominating, though a combination of rich brown and malachite green are here and there observable. It is, however, at the option of the purchaser to have the design in parti-colours if preferred.

The introduction of the ceramic grates necessitates that of the accessories *en suite*; accordingly we have hearths of tiles in unison, and kerbs to match. So far as chimney-pieces are concerned, wood appears to be the most in character, though some

charming examples are exhibited in which a combination of that and Doulton ware appears to advantage. There are others, again, in which the chimney-pieces are composed entirely of terra-cotta, accompanied by a pier-glass in terra-cotta frame; but although we may admire the artistic work expended upon them we are not bound to give our adhesion to the idea, which, in our opinion, has a cold and somewhat cheerless look.

To complete the *ensemble*, Messrs. Doulton have supplemented their Exhibition with a variety of plaques and panels of high artistic worth in wall decorations, while *garniture de cheminée* of Doulton ware adds materially to the general effect. If we are to venture an opinion on the new fire-places we must admit there is much to recommend them. The warm cheerful appearance is one of their best attributes, the absence of all harshness and stiffness in the designs is equally meritorious, the novelty of the introduction will commend itself to those in search of changes; and the fact that they can be adapted to all the features of ventilation and smoke-consumption as easily as an iron grate, appears to leave nothing to place them in a disadvantageous position. The Exhibition will, we understand, remain open until the end of the month.

THE MANCHESTER SCHOOL OF ART.

THE annual meeting of the Manchester School of Art was held on Monday evening. Mr. F. W. Grafton, M.P., presided. The report stated that the number of students on the books in 1878-79 was 420, in 1879-80 was 377, in 1880-81 was 346, and in 1881-82 was 421. The years 1878-81 were a transition period, the students being in a somewhat disorganised state, partly in anticipation of removing into the new premises, and partly in the course of actual removal. The attendance of former years is now, however, fully re-established, and at the present time a greater number of students may be found actually at work in the school than at any time in its previous history. There is, however, ample accommodation for greater numbers, and probably no other school of art has buildings so complete in all respects and so well adapted for study.

There is now an accumulation of deficiency of income amounting to about 750*l.*, which it would be a great gain to the school to see extinguished. On the Building Fund there is still a balance of about 2,400*l.* owing, and on both these sums interest has had to be paid to the bank. The amount of grant earned by the school was in 1878, 138*l.*; 1879, 250*l.*; 1880, 241*l.*; 1881, 252*l.*; 1882, 275*l.* This grant, moreover, can only be earned by students who have been under the tuition of a master holding certain Government certificates. Many excellent works produced in the school were inadmissible to the national competition by reason of a rule of the Department, that the whole of such work must be executed in the school in the presence of a master. The Council are of opinion that so long as the actual design is arranged and its main features put on paper in the school the mere repetition of parts, filling up with colour or shading of the rest of the production, is a mechanical operation which might well be done elsewhere, and the time now spent in the school in such mechanical work might be more profitably employed. It is with regret that the Council have to announce the resignation of Mr. Muckley, who, after holding the position of head-master for twenty-one years, proposes to retire at the close of the present term. The Council desire to recognise the long and valuable services rendered by Mr. Muckley to the school, and they cordially wish that he may, in the wider sphere on which he is entering, meet with all the success to which his skill and talent entitle him. The Council have already taken steps to secure the appointment of a successor to Mr. Muckley, but the requirement of the Department that the teachers of any art school claiming the usual "payments on results" of the students' works must hold certain certificates of the Science and Art Department (otherwise the grant is not allowed), very much confines the circle of applicants for the head-mastership. However competent a man may be as an art teacher, if he is not qualified as a certificated art master, the Council are precluded from appointing him unless they are prepared to forego the important part of income derived from "results."

A report from Mr. Muckley was read in which he said:—The fact of this neighbourhood always having been so very utilitarian in its character, there appears to me to have been but little chance for the cultivation of an art instinct among the population, and without this faculty at the root mere teaching cannot produce great results. With the masses art is neither understood nor cared for, and the chief work of a teacher for a long time to come, I am convinced, should be mostly confined to an endeavour to create an art fibre, so to speak, in those with whom he may come in contact as pupils; the sowing of art seeds carefully and well, so that the next generation may get the benefit of the work; and should he be fortunate enough to see, now and then, a solitary plant spring up in health from his sowing, he must be satisfied, for he will get no more. It has been assumed that designers for ornamental art might be produced in Manchester as in other places. This is assuredly a mistake, as there are no materials by which they may be educated, no sources from which they may derive ideas; in short, no food on which they could feed. Nor, indeed,

has there ever been anything of the kind, with the exception of such objects as have been seen in a passing exhibition, and these exhibitions have not been frequent enough nor of sufficient duration to produce lasting effects. Of nothing, nothing comes, and without museums of objects of decorative art permanently placed, and easy of access, you will have no good ornamental designers.

The Chairman said the school had entered upon a new epoch of its history, and it was important that they should start free from the debt which arose chiefly from the inadequate accommodation of the old school.

Mr. T. Worthington, in moving a vote of thanks to Mr. Muckley, and the assistant masters and teachers, said it was impossible for them not to feel extreme regret at the retirement of the head master after so long a connection with the school. At the time of Mr. Muckley's appointment the school was in a most unsatisfactory state, almost in a state of demoralisation. He need not say that the school had very greatly changed since that time. He was quite sure that there was not a single member of the Committee who did not wish Mr. Muckley the greatest success in the work he was about to enter upon.

A vase, as a testimonial, was afterwards presented to Mr. Muckley on behalf of the students by Mr. R. F. Ridley, who spoke of the ability displayed by Mr. Muckley in conducting the school, and the regret which the students felt in losing his valuable services. Mr. Muckley thanked the students for their regard, and wished them continued and increasing success in the pursuit of their studies.

The Mayor moved the re-election of the officers and council, with thanks for their past services.

The Bishop of Salford, in seconding the motion, said that not only for the sake of commerce but for the sake of all classes of the community was it important that art should be cultivated. Literature, science, and the various professions which engaged the time and thoughts of men had no doubt a very important effect upon their character, but it was also perfectly certain that the effect of art upon the population was very much to refine and purify their tastes, and therefore to give them higher and nobler aspirations. They had heard from Mr. Muckley an extremely able and interesting address, in which the lights and shades had been extremely marked. It was somewhat discouraging when he heard him speak of how small had been the response on certain occasions to the vigorous efforts which he himself had made. It was a little discouraging to hear that Manchester, with its enormous population of mechanics and others engaged in the utilitarian occupations of life, did not respond more than they had done to the appeals to engage in the pursuit of art studies. It seemed to him that a school like that, placed in the very centre of the population, ought to do something more than receive within its walls those who might be able to attend the classes. He should like to see, if it were possible, the School of Art exercising a wider influence, stretching forth its wings, and, if it could not gather in the mechanics, bring in at least the boys and girls growing up in the higher schools, the grammar schools and colleges in and around Manchester and the various parts of Lancashire. It seemed to him that a school like that should be able to influence the schools and colleges of the whole county.

The resolution was adopted.

The Chairman, before distributing the prizes, addressed the students. He strongly advocated their having in future more definiteness of purpose in the direction of their studies. Hitherto there had been little encouragement in the formation of special classes, but the council of that institution intended to give every facility for the development of whatever special talent might exist in their midst. One very important consideration in reference to these matters was who was to provide the needful funds, and he confessed that his experience of the funds having to be obtained by voluntary action was very unsatisfactory. If they could not be supplied by voluntary means, he supposed they must come out of the rates, on the same principle that free libraries were supported from the rates.

THE ASHBURNHAM MANUSCRIPTS.

A CORRESPONDENT of the *Times* says that the splendid collection of manuscripts brought together by the late Earl of Ashburnham has been offered to the nation, and the trustees of the British Museum are in treaty for its purchase. Lord Ashburnham is unwilling that the collections which his father formed, and with which his father's name will always be associated, should be broken up. But the printed books and the manuscripts of the library may be fairly separated, and accordingly the latter are now offered *en bloc* to the national library.

The Ashburnham manuscripts consist of four divisions, or we may even say of four separate libraries. The first is the great collection formed by Professor Libri, which Lord Ashburnham purchased in 1848, a collection rich in codices of most ancient date, in illuminated manuscripts, mediæval literature, particularly that of Italy, and in most extensive correspondence of scientific and literary men. Next come the manuscripts brought together by the French collector Barrois, the strength of which lies in their invaluable early texts of French poetry and romances. The third

portion is the Stowe Library, which passed from the Duke of Buckingham to Lord Ashburnham in 1849. Here we have a rich store of material for English history, ancient charters, monastic registers, State papers, heralds' visitation books, and antiquarian collections. Irish history and literature are also well represented, for this portion of the Ashburnham Library includes the numerous and valuable codices which belonged to the Celtic scholar, Dr. Charles O'Connor. To the three great divisions which have been named is to be added the portion called the Appendix, a modest title which ill describes the numerous and well-chosen manuscripts which the late Earl acquired from time to time at various sales and from many persons and places. The exquisitely illuminated books, the rich bindings, and the long row of Chaucers, Wycliffes, Occleves, and other early English manuscripts, the historical papers, charters, and registers of this part of the library prove what patience, good judgment, a ready purse, and the reputation of a great connoisseur can achieve. Altogether the Ashburnham collection amounts to something under 4,000 volumes; and considering the almost priceless nature of certain individual volumes, and the varied and high literary value of the different classes, it is no exaggeration to say that, as a private library of manuscripts, it stands unrivalled.

Among the most ancient manuscripts of the library, the one which is probably best known by repute is the Pentateuch of the Libri collection. Of at least as early a date as the seventh century, this codex is one of that small number of volumes which have descended to us to show what the artist's brush could do in those early ages. Executed probably in Italy, it contains nearly a score of large coloured illustrations, of the greatest value to students of the history of painting and of costume. Of even greater interest, however, to the palæographer, are the still more ancient Latin manuscripts, of which there are not a few. One of these, a portion of a Psalter, may be assigned to as remote a period as the fourth century, and would probably stand comparison with the oldest codices which even the Vatican Library could produce.

In the literal *embarras de richesses* in which an examination of the catalogues of this wonderful collection involves us, it is difficult to select volumes for special notice without feeling that we are doing a wrong to others of equal value which our space compels us to pass over in silence. To take things almost at random, we may turn to the catalogue of the Stowe Collection, a thoroughly English one, and jot down a few of its chief treasures. First stands a volume which is justly called matchless, containing upwards of forty Anglo-Saxon charters, dating from the close of the seventh century to the period of the Conquest. The stimulus which the study of our early history and language has received of late years renders the preservation of these ancient relics of national importance. Of kindred interest and value is the ancient register of Hyde Abbey, Winchester, written in the eleventh century, and adorned with drawings by an Anglo-Saxon artist.

The illuminated manuscripts are of immense value. The schools of England, France, Italy, Flanders, and Germany are represented, the first three by numerous examples, and all by one or more manuscripts of the very first order of excellence. Of English manuscripts the first to attract attention is a Psalter of the fourteenth century, ornamented with miniatures and borders drawn with extreme delicacy and coloured with the most exact harmony. But this is eclipsed by a Book of Hours—a perfect marvel of the finest workmanship of the beginning of the fifteenth century, which probably stands alone among the productions of our native artists of the period. Nothing can surpass the richness of the designs of the borders or the minute working of the details of the miniatures. There is no manuscript in our national collection which can compare with this beautiful volume, and the few well-known illuminated manuscripts of the same time which are in private hands are of inferior merit. No doubt it was executed for some member of the Royal Family, and it afterwards came into possession of Elizabeth of York, and from her descended to Mary Queen of Scots.

The French school is well represented by a delicately illuminated Psalter of the middle of the fourteenth century, ornamented in the style which is conspicuous in the manuscript executed for that great collector Charles V.; by a Boethius, of the fifteenth century, illustrated with miniatures of the finest execution; by several volumes of the same period filled with miniatures in colours or camaieu-gris; and by a Livre d'Heures of the time of Francis I., in which is a series of paintings of the most perfect finish.

Of the Flemish school of Van Eyck, of the latter half of the fifteenth century, is a Book of Hours, enriched with miniatures delicately drawn in outline, and shaded with Indian ink. For the excellent disposition of the draperies and for softness and variety of expression these drawings take a high rank as works of art, and can scarcely be sufficiently praised. Of quite a different style and interest is a little volume which may be noticed in this place. It contains a series of illustrations, in Indian ink, of the Passion of Our Lord, drawn in the year 1598 by Rubens, then a young man of two-and-twenty. This little book will probably attract a good deal of attention in the future, on account of its connection with a great name as much as for its artistic value. A remarkable manuscript is a Psalter of the beginning of the fourteenth century,

executed in South Germany and filled with large miniatures and profuse ornamentation. The influence which Italian art exercised over the German miniaturists who worked on this volume is most conspicuous, and the fact that there are so few extant specimens of the German school of illumination of this period gives a singular importance to this handsome manuscript.

Of the Italian school there are several beautiful volumes; but we must be content with noticing two only of exceptional interest. First, a Book of Hours, written in the beautiful handwriting of the famous scribe Sinibaldo of Florence, in 1485, probably for Lorenzo de' Medici. The miniatures of this volume are remarkable for the small scale on which they are drawn and for the finish of the painting; while the borders are some of the richest examples of the fine star patterns which give so much grace to Italian manuscripts of this period. The second manuscript is one of those rare volumes which render famous any collection to which they may happen to belong. Known as the Albani Missal, after its former owners, it was purchased in Rome in 1838 by the late Mr. James Dennistoun. It is a manuscript of offices, and was executed apparently for Alemanno Salviati, gonfaloniere of Florence and brother-in-law of Lorenzo de' Medici, and given by him to one of his relatives of the house of Baroncelli. The calendar at the beginning is ornamented with most exquisite medallions in the best Florentine style, and the borders and initials throughout the volume are in no way inferior. But the glory of the book consists in five full-page miniatures, each the work of a master. The first is by the hand of Amico Aspertini, of Bologna, the pupil of Francia, and is signed by him. The next is attributed, with apparently good reason, to Lorenzo da Credi; and the third and fourth, though unassigned, are of the highest excellence. The fifth crowns the book with a St. Sebastian, a composition full of tenderness and grace, which at once proclaims itself to the delighted gaze as the work of Perugino, and renders needless the inscription, "Petrus Prusinus pinxit," which is to be read at the foot of the painting. The sum demanded for the collection of manuscripts *en bloc* is 160,000*l.*, and for the library 150,000*l.*

THE PAISLEY MUNICIPAL BUILDINGS SCHEME.

A MEETING of the Paisley Town Council was held on Tuesday, when it was reported that Messrs. Barclay, architects, Glasgow, had prepared plans for the proposed new municipal buildings, and placed them in the hands of Mr. Robert Scott, secretary of the Institute of Measurers in Glasgow. Mr. Scott has estimated that the total cost of the buildings, with spire, would be 19,850*l.*, to which should be added the price proposed to be paid for the site, extending to 840 square yards, 7,000*l.*, making, with 3,150*l.* for furniture and contingencies, in all 30,000*l.* The sum at present at credit of surplus revenue was 13,653*l.*; surplus for current year, 3,420*l.*; price of steeple site and interest to last balance, 1,827*l.*; or, with 100*l.* of interest thereon for this and next year, a total sum of 19,000*l.*—leaving 11,000*l.* to be borrowed. From a careful estimate of the rents to be obtained from shops and offices to be provided in the proposed buildings, they were satisfied that after deducting rates and repairs there would be available for payment of interest not less than 550*l.* per annum, which would be more than sufficient for that purpose. It was also anticipated that after the application of the accumulation of surplus revenue the annual surplus would not be less than 1,000*l.*, which with the other moneys should wipe off the borrowed money in less than ten years. It was agreed to withdraw the burgh's offer of 10,000*l.* to the Commissioners of County and Municipal Buildings, Paisley, for the two-thirds of the County Buildings of which the burgh was at present the tenant of one-third. It was also remitted to the Town Council in committee to consider the matter of providing new buildings, and to report.

Christ Church Cathedral, Dublin.

SIR,—In your account of the restoration of the above cathedral in your journal of the 3rd inst., you give an abstract from the book published by Messrs. Sutton Sharpe & Co., in which the late Mr. E. Street, R.A., said: "The risk and difficulty, and consequent anxiety, in undertaking such works were very great, &c., and the work was done *throughout*, thanks to the energy and skill of the clerk of the works (Mr. Doolin) and the builders (Messrs. Cockburn), without a sign of a crack or settlement."

I have no doubt the name of the clerk of the works mentioned will surprise not a few as much as myself, after I have superintended the restoration of the largest and most important part of that cathedral. If needed to verify my statement I could appeal to

the noble patron, Mr. Roe, or Canon Seymour, who knows every day's proceedings from the commencement to the end. Besides, in my capacity as clerk of the works I had the honour of conducting over the cathedral H.R.H. the Duke of Connaught, on different occasions His Grace the Duke of Marlborough, His Grace the Duke of Leinster, and, amongst other most eminent men the Right Hon. W. E. Gladstone, to whom the late Mr. Street himself introduced me as his clerk of the works.

I am, Sir, your obedient servant,
159 Stamford Street, Waterloo Road. WM. CONRAD.
February 12, 1883.

P.S.—I beg of you to give the above as prominent a position as the statement had which requires correction, feeling as I do all the more grieved from the smart I endure by the loss of a most important appointment during the last few weeks from similar misrepresentation about other important work.

The Bradford Chimney Disaster.

SIR,—The verdict of the jury which sat to inquire into the calamity above-named exceeds in vacuousness the average of "lame and impotent conclusions" by which coroners' juries are distinguished. It says, in effect, that "nobody is to blame; it is all an accident; everybody had done his best. So, set the mills to work again, and let us say no more about it!"

Such an occurrence cannot legitimately be called an "accident"—which means an unusual casualty, generally the result of an unexpected conjunction of circumstances. There was no such conjunction in this case. A chimney of this kind, more perhaps than most structures, must have substantial *reasons for standing*, or it will surely fall; that is, unless adequate means are used and proper conditions observed to *make* a chimney stand, of course it must come down. This is too obvious almost to need expression. If these means and conditions were neglected, the fall was no accident, but a *certainty*. The logical conclusion of the Coroner's verdict is, that chimneys of such height and such dimensions cannot be built at all, if due regard be paid to public safety; because, if this is a case where Mr. Nobody was to blame, it can only be because the direful result was inevitable. It is from this point of view, secondly to its humanitarian aspects, that the question interests the building fraternity. The problem whether any given building will stand or fall is not dependent upon chance occurrences; with sufficient materials of good quality scientifically used, all buildings last, if properly cared for, until worn out by time. The chimney now in question, so far from having been worn out by time, was not twenty years old; but it has collapsed—disastrously. This is not an accident, for other chimneys in the neighbourhood (one of them much higher, and some in much more exposed situations) were subject to the same conditions, and sustained no injury. The wind blew as strongly on them as on it; it has blown as strongly both before and since without producing any similar results. The wind, therefore, and "accident" may be dismissed from the inquiry. The Newlands Mills chimney must have fallen because of some *defect* either in its construction, or in its subsequent treatment, of which the fall is the cumulative result. We may deny without qualification the suggestion that such a structure cannot be built with safety: there are a goodly number in existence quite as large, and some much larger, which stand quite intact, and of which no apprehension need arise. There must be reasons, therefore, for what has occurred; it was the duty of the jury to have found them out, and to give expression to their logic, instead of using so many vague and meaningless phrases.

The evidence shows first, that the site was unsuitable, owing to the fact that the coal had been got out beneath it; but in certain districts, if there are to be any buildings at all, they must occasionally stand over depleted coal pits, and Bradford is one of these. But the evidence further shows that proper means were not taken to remedy the well-known weakness of the foundation: it is merely "packed" from below. As it was originally intended to carry, on a contracted area, a weight which would have exceeded 5,000 tons, it was almost impossible to form an adequate foundation under this chimney after the coal had been "won" without building it up from the pit's floor (or lower) either with walling or cement concrete, because there were no means to insure solidity throughout the packing; and, indeed, the process of such solidification in a space only a few feet high, and many yards below the ground surface would be exceedingly difficult. On examination the packing has been declared to be satisfactory; but the signs of failure cannot reasonably be looked for, after so great a lapse of time; and it is by no means certain that the examination was complete.

Thirdly, the structure appears from the evidence of Mr. William Moulson (head of the firm of John Moulson & Son, the contractors for the work) to have been devised in the oddest way. The late Sir Henry Ripley, Bart., the proprietor (then Mr. Ripley), sent for the contractor and asked him his price for a chimney 300 feet high, and so much in diameter, &c., &c. In reply the contractor makes his calculations then and there: one may imagine the stumpy bit of pencil, the scrap of waste paper, the uncouth figures, and probably the proprietor standing by and bantering,

every now and then, to restrain the aspirations of the contractor. The price stated on the spot was then and there accepted. It was less than 1,000*l.* for a chimney a hundred yards high—a totally inadequate price. No drawings were made until afterwards, and it seems doubtful whether a specification was ever written! After the contract was decided upon, an architect was appointed, who appears to have gone through the formality of making drawings of some sort, in agreement with the terms of the contract, and not in accordance with his own views—a curious inversion of practice. Also, a clerk of works was appointed. But these officials, with mysterious complacency, took their instructions from their wealthy client; but both of them raised sundry objections (they are all *dead* now, master, architect, and clerk) but were fatuously informed that it would have to be as the Great Mogul ordered it. Indeed, the Mogul was so great and so opinionated that, had he ordered the chimney to be placed bottom uppermost, it must be done; and, twenty years ago, no authority in the town dared to interfere with him.

Well, to hasten on, for your space is precious. We find, in the fourth place, that the wallstones used on the outside were only of an ordinary width on bed, 6 or 7 inches—namely, a width quite insufficient to bond in the width of the backing. This can only be accounted for by the absence of a specification, and the fact that the work was let, as we have already seen, on terms to gratify the parsimony of an egotistic millionaire. The character of the backing has been attacked by some witnesses; but, beyond the fact that it was of rubble instead of brick (a fact which was beyond the contractor's control), it has not conclusively been proved to be defective. A grave question, and probably the gist of the matter, is included in the relative static conditions of the casing, the backing, and the brick lining. It is not certain that some part of the burden of the superstructure did not impinge on the firebrick lining, either structurally or by subsequent displacement, and the expansion and contraction of that lining from alternate accesses of heat and cooling must have had a wrecking effect on the chimney as a substantial structure. Firebricks exposed to the fierce heat of *thirteen* boiler flues cannot last long; but I cannot recall to mind that part of the evidence, if any, which described its condition. But it is painfully clear that all structural questions were settled by "rule-of-thumb," according to the bidding of the great purse-bearer, without reference to any scientific method or authority.

In the fifth place, when it was many yards high the chimney heeled over; and another unscientific individual, called a "steeple-jack," took charge of the whole affair, and (unlike the scientific advisers) was allowed to do just as he liked with it. This gentleman (also since dead) had cut and strengthened many brick chimneys, and, for all he knew, a stone one was just the same thing! In doing the work he had undertaken, he broke (all?) the bondstones, and left the chimney a mass of stone and brickwork, without internal coherence, standing on a defective foundation*—a terror to contemplate, when one comes to understand it.

The chimney, shorn of a great portion of its intended height, but "decorated" with panels and sinkings designed by its owner, and executed against the judgment of his professional and practical advisers, was finished, and stood without much apparent change some eighteen years or so. It is in evidence that alterations were made to the inlets of the flues, to *increase* their size—a most reckless proceeding. But it is said that people of an indescribable character "rush in where angels fear to tread!" The outer casing lately began to bulge in places; stones, &c., fell out. Horses were removed from adjacent stables, and apprehensions were freely and frequently expressed—but the factory hands went in and out much as usual. The chimney fell and killed fifty-five persons, besides injuring others. The witnesses who *saw* the chimney fall relate that it appeared to subside rather than to go over—a curious instance of optical delusion—because the distance to which the top of the fallen structure reached shows that it went clean over, and that the centre of motion or pivot was not far above the ground. Besides this, we know that the subsidence described was absolutely impossible, because it could not sink into the earth, for any distance appreciable to the unaided eye, unless the earth opened to receive it, which it did not. No doubt the foreshortening in the perspective at certain points of view, and the excitement of witnessing such a spectacle, caused the misapprehension. It is reasonable to assume that some subsidence had taken place, in which water in the coal-pits may have played an insidious part. But this is a problem which requires more evidence than has yet been given to the public.

But one question requires to be asked and answered at once: it is, whether such erections should be permitted under such circumstances? Ought a self-complacent mill-owner to be allowed to risk the lives of his servants by building instruments capable of destroying them wholesale, just according to his own whim, or according to the blind instincts of his sordid longings for "economy?" The man is dead; let us not forget the Latin maxim; but let not such a thing be possible in the future. The town authorities, of course, disclaim responsibility; surely there are enough of these public authorities, and surely they are costly enough. Have they not

* It is worth while to inquire whether the operations of Sir G. G. Scott at St. Albans Abbey had the same effect, as regards the bondstones.

sufficient powers? Over pigsties, and privies they are supreme, and in respect to ashpits are said to be very irritating; but a building capable of destroying hundreds in a few minutes (for providentially the fall "happened" during breakfast-time, when the majority of the hands were away!) is allowed to be put up without check or guidance. It is not so, I am told, in France or in Germany. But England is a "free country" (for the rich), and (the poor) pay the penalty of her freedom!

The evidence, voluminous enough in some regards, has not been without reticences: the reason for it is only too plain. Such an inquiry ought not to have been held in such a place as Bradford, or before a Bradford jury. The local interests of the parties chiefly concerned are there paramount, and their power and influence almost unlimited. There could be no other result than the verbose vacuities of the verdict already given. Who could say anything to blame such nice rich people? Obviously, it would not do. Accordingly, we find that the foreman of the jury was brother and late partner of one of the witnesses who examined the chimney only a few days before it fell; and the only *volunteer* witness complains of the treatment accorded to him at the inquiry. The proceedings (decorated with good dinners, probably?) wind up with a nauseating *feu de joie* of personal compliments between the coroner, the lawyers, and the government official, who hopes to have the pleasure some day again to meet all the other good fellows "on more agreeable business." Is the public to be satisfied with such proceedings as these? Meanwhile, fifty-five unfortunates, many of them very young, have died a cruel, a premature death. Let us not forget this!—not, indeed, to resent or avenge their death, for that also would be cruel, but to be enabled to say, if possible, that such a thing cannot happen again.

I am, dear Sir, yours obediently
February 10, 1883. A COUNTRY ARCHITECT.

ARCHÆOLOGY.

Archæological Discoveries in Mexico.—Important archæological discoveries have recently been made at Mitla, a village in Mexico, which is situate between twenty and thirty miles from Oajaca, in the table-land of Mixtecan. Extensive remains of ancient palaces and tombs have been revealed, and it is stated that they are exceptionally remarkable from the columns supporting the roof, a style of architecture peculiar to the district of Mexico in which they have been found. These ruins have been explored and photographed by Herr Emil Herbruger, although he was not permitted to excavate the sites. In a description of the ruins, Herr Herbruger states that the great hall contains six columns, and is 37 mètres long by 7 broad. Each column is $3\frac{1}{2}$ mètres in height, and is of solid stone. The hall, which is entered by three doorways, was used as an ante-chamber for the Royal Guards. The tombs are all of equal size and T-shaped. The walls are embellished with stone mosaics. The vault floor is one metre below the surface, and at the entrance stands a monolith column. The tombs extend in order from the column, each being five mètres long by one and a-half broad; there are also several columns, each two mètres high and one and a-half in diameter. For some time Herr Herbruger and his Indian attendants used the tombs as sleeping apartments, but subsequently the Indians refused to sleep in the tombs, on the ground that they were haunted. The explorer intends to publish a work descriptive of these discoveries, with photographic illustrations.

Primeval Celtic Map Stones.—In many parts of Switzerland are often found smooth, flat stones, evidently hand-polished, and covered with dots, lines, circles, and half-circles. The origin and use of these stones, known among country people as *Schalensteine*, has long been a moot point among the learned. Some have thought they were charms, others that they were meant to commemorate the dead, or that the signs on them were undecipherable hieroglyphics; but it has been reserved for Herr Rödiger, of Bellach, in Solothurn, to throw a new light on these mysterious relics of the past and suggest a theory concerning them which seems to meet all the necessities of the case. The *Schalensteine*, he says, are neither more nor less than topographical charts, as a comparison of them with any modern map of the districts in which they are found will show. The engraved dots correspond with existing towns and villages, the lines with roads. Even the fords and mountain passes are indicated. Herr Rödiger has examined many of these stones from various parts of the country, and he possesses a collection, picked up in Solothurn, which form together a map of the entire canton. Another significant circumstance is that the *Schalensteine* are mostly found at intervals of about two hours (say, six miles) from each other, and at spots where several roads meet. The former Herr Rödiger calls "headstones" (*Hauptsteine*), the latter he denominates "by-stones" (*Nebensteine*). If he be right in his hypothesis, the places where these stones are met with possessed considerable populations long before the dawn of history; even the villages shown on the *Schalensteine* must be far older than the Christian era. Herr Rödiger considers the Swiss map stones to be of the same origin as the similar stones which are found in Germany, Scandinavia, India, and further Asia, and

sees in them another proof of the high antiquity and common origin of the Indo-Germanic races, and the existence among the latter, in an indefinitely remote age, of civilised habits, organised trade, and more culture than is generally supposed.

LEGAL.

Liverpool Assizes.—February 10.

(Before Mr. Justice KAY and a Special Jury.)

HESKETH v. ROLLWAGEN.

ARCHITECT'S FEES.

In this case the plaintiff, Mr. William Hesketh, architect, Liverpool, sought to recover from the defendant, a waiter at the Alexandra Hotel, Dale Street, money due as commission for professional work done. The defence was that the work had not been carried out according to the instructions given. The action was brought to recover between 200*l.* and 300*l.* for work done by the plaintiff in the capacity of an architect. The defendant became interested with a man named Copestake about July last, in some land at Heswell, which is midway between West Kirby and Parkgate, and upon this property they contemplated the erection of an hotel. The plaintiff was applied to by Copestake, who took him to the defendant, and it was explained that, as there was no hotel in the neighbourhood of Heswell, it might be a good speculation to build one. It was necessary to first procure a license, the magistrates by a recent Act having power to grant a conditional license on plans being submitted to them. It appeared, however, that there was a rival aspirant for hotel keeping in the village, a man named Bainbridge having purchased some house property, which he proposed to alter so as to adapt it to the business of an hotel. The defendant, being of opinion that this would not satisfy the magistrates, instructed the plaintiff to prepare his plans, the commission agreed on being $2\frac{1}{2}$ per cent. on the cost of the building if the plans were not carried out, and 5 per cent. if they were. The application for a provisional license came before the magistrates on August 31, but as the plans did not show stabling accommodation the consideration of the subject was postponed till the following licensing sessions. The plaintiff was thereupon instructed to provide the plans, and did so. He also prepared an estimate of the cost of the building, putting it down at from 8,000*l.* to 10,000*l.*, the stabling being for about sixty horses. The plans were again submitted on September 28, and the provisional license was granted, and confirmed on October 7. The defendant then instructed the plaintiff to have the plans, tracings, and specifications completed by November 16, but between that date and the end of the month the defendant seemed to have changed his mind, and affected to be surprised at the plaintiff's estimate of the cost of a new hotel, and refused to pay a penny for all his labours. The plaintiff stated that no limit was given as to the cost of the hotel, the defendant on the other hand saying that a few thousands were not material, he having friends to help him; and Mr. Bainbridge deposed to the defendant paying him 150*l.* to buy off his opposition to the erection of the hotel as designed by the plaintiff, in respect to certain restrictions on land required for the scheme.—The defence was that the plans exceeded in cost the instructions given, and that the plaintiff was expressly informed of the extent to which the defendant would go, namely, about 3,000*l.*—The jury awarded the plaintiff 200*l.*

CHURCH BUILDING AND RESTORATION.

Temple Normanton.—A new church has been opened. The building has been designed in semi-Norman style of the time when the Knights Templars held the manor of Normanton. Messrs. Rollinson & Sons, of Chesterfield, are the architects. The contractors for the work were Mr. James Hoole and Mr. David Brown, both of Hasland.

Laindon.—The parish church has been reopened after restoration, which has been carried out from the plans of Mr. F. Chancellor, architect, of Chelmsford, by Mr. Letch, of Braintree.

Lymington.—Works of improvement have been carried out in the chancel of Milford Church, from the designs of Messrs. John Colson & Son, architects, of Winchester.

Gateshead.—A Wesleyan Chapel has been opened at Low Fell. The building will seat 500 persons, and has been erected at a cost of 2,800*l.* from the designs of Mr. J. J. Lish, architect, of Newcastle-on-Tyne. The contractors were Messrs. Greason & Stockdale, of Gateshead.

Wesleyan Chapels.—According to the report of the Wesleyan Chapel Committee, 369 cases have been sanctioned during the past year, representing 250,431*l.* The estimated cost of the chapels was 150,616*l.*; ministers' houses, 12,941*l.*; school-rooms, 15,834*l.*; in addition to alterations, organs, &c. Of the proposed new chapels, 62, to accommodate 13,595 hearers, are to be erected in places where previously there were no Wesleyan Methodist

chapels; and 60, estimated to provide accommodation for 21,666 hearers, are to supersede former erections reported as having provided 11,771 sittings. The total additional accommodation provided in proposed new chapels is 23,490 sittings, being 4,923 more than the number provided by the new erections sanctioned last year. The chapel enlargements will provide for 2,072 additional hearers. The temporary debt sanctioned on the new chapels is 28,076*l.*, being rather more than 18 per cent. on the outlay.

SCHOOL BUILDINGS.

Glasgow.—Two public schools just completed by the Glasgow School Board were opened on Saturday last, at John Street, Bridgeton, and Dennistoun. The site of John Street School extends to 3,989 square yards, the whole of which is available for building. Mr. William Landless, architect, by the plans prepared, has utilised the ground as follows, viz.: School buildings, 1,012 square yards; playground and offices, 2,977 square yards—total, 3,989 square yards. The total accommodation provided is for 1,149 scholars, allowing 8 square feet for infants, and 10 square feet for the older scholars. This school and the one at Dennistoun are the first schools that have been built in the city according to the most recent requirements of the Scotch Education Department. Offers for the principal artificers' work were accepted on June 17, 1881, to the amount of 9,561*l.* 3*s.* 5½*d.* Mr. Landless, architect, has added to this amount, for furniture, architect's fees, &c., the sum of 1,200*l.* The cost of the buildings will be equal to 9*l.* 7*s.* 3¾*d.* per scholar. The site for the school cost, including legal expenses, the sum of 7,047*l.* 9*s.* 11*d.* The total cost of the site and buildings is 17,808*l.* 13*s.* 4½*d.*, which is equal to 15*s.* 9*s.* 11¾*d.* per scholar.

Glasgow.—The site for Dennistoun School extends to 4,529 square yards, of which 3,300 yards are building ground. Messrs. James Salmon & Son, architects, by the plans prepared, have utilised the building ground as follows, viz.:—School buildings, 1,000 square yards; playground and offices, 2,300 square yards—total, 3,300 square yards. The total accommodation provided is for 1,050 scholars—allowing 8 square feet for infants and 10 square feet for the older scholars. Offers for the principal artificers' work were accepted on September 26, 1881, to the amount of 8,391*l.* 8*s.* 0¾*d.* Messrs. James Salmon & Son have added to this amount, for furniture, architects' fees, &c., the sum of 1,901*l.* 6*s.* The cost of buildings will be equal to 9*l.* 16*s.* 0¾*d.* per scholar. The site for the school cost, including legal expenses, the sum of 3,888*l.* 14*s.* 3*d.* The total cost of the site and buildings is 14,181*l.* 8*s.* 3¾*d.*, which is equal to 13*l.* 10*s.* 1¼*d.* per scholar.

NEW BUILDINGS.

Building in Birmingham.—The following is the Building Surveyor's return of new buildings erected in Birmingham during the year 1882:—Churches 2, chapels 0, schools 6, warehouses 64, miscellaneous 62, alterations 163, dwelling-houses 601, shops 65; total 963. There is a remarkable decrease in the number of last year's buildings, as compared with 1,594 buildings erected or plans approved in 1881, 1,659 in 1880, 1,625 in 1879, 1,660 in 1878, and 3,053 in 1877. The schools are as follows:—Foundry Road Board Schools, Loxton Street Board Schools, Stratford Road Baptist Church Schools, Infant Schools, Shadwell Street, Dudley Road Schools, Free Grammar School, Camp Hill. Among the "miscellaneous" are:—Coffee-house, corner of Corporation Street and Cherry Street; the restaurant, Corporation Street; new Stork Hotel, Corporation Street; new Parish Offices, corner of Edmund Street and Newhall Street; new Eye Hospital, corner of Edmund Street and Church Street; Lincoln's Inn, Corporation Street; Branch Dispensary, Monument Road; artisans' dwellings, corner of Miller Street and Aston Brook Street; Arcade, Dale End.

GENERAL.

Sir F. Leighton, P.R.A., has allowed his painting, *Phryne at Eleusis*, to be exhibited at the Royal Scottish Academy exhibition, which opens to-day.

Mr. W. D. McKay was on Saturday last elected an Academician of the Royal Scottish Academy.

The Bray Lantern, invented by Messrs. George Bray & Co., of Leeds, has been adopted by the Trustees for the lighting of Glasgow harbour.

Messrs. McKissock & Rowan, of Glasgow, have prepared plans for a new parish church at Girvan. Attached will be a hall for meetings, with sittings for 300 people.

Mr. J. Forbes Robertson has received a commission from Mr. Henry Irving to paint the cathedral scene in "Much Ado about Nothing," with portraits of the performers at the Lyceum.

Messrs. Smith & Stokoe, of the Eaglescliffe Foundry, Stockton, have secured a contract for the supply of castings to Messrs. Gray & Co.'s new marine engineering works at West Hartlepool.

A Collection of Brass Rubbings, containing nearly one hundred and fifty examples, has been bequeathed by the late Rev. G. Rowe, of York, to the British Museum.

A Conference was held in Dublin on Monday at which it was unanimously recommended to the Government to construct the new National Library on the north side of the courtyard of Leinster House, and for that purpose to acquire the property extending to the College of Physicians, and to erect the proposed new Museum of Science and Art on the opposite side of the courtyard extending to and beyond Kildare Place.

Mr. Herbert Phillips has just given a fine landscape by Tennant, *Evening Light Over Wanstead Heath*, to the Manchester Art Museum. Mr. G. Falkner Armitage has given three beautiful examples of old Persian embroidery, and Mr. T. R. Wilkinson a water-colour copy of the drawing of Dover made by Turner for "The Ports of England."

An Altar-piece, painted by Mr. Burne Jones, has been placed in St. Peter's, Vere Street, to the memory of the late Rev. Frederick Denison Maurice, M.A.

A Wesleyan Chapel is to be erected at Harrogate at the sole cost of Mr. Samuel Meggitt. Accommodation is provided for about 300 persons, from plans prepared by Mr. James Wilson architect, 12 East Parade, Leeds.

The Italian Art Exhibition, in the Corporation Galleries, Glasgow, will, during the remaining time, be opened free on Mondays, Fridays, and Saturdays.

Competitive Designs are to be obtained for the proposed town hall in Grangemouth.

The Wolverhampton Town Council have determined to engage the services of an engineer to advise on the whole question of the disposal of the sewage of the town.

Messrs. Howorth and Rowley, jun., of Manchester, are raising a fund for the purchase of casts from the Græco-Roman and Roman busts in the British Museum and other galleries. A series will be offered to the Manchester Art Gallery, and a similar set, with the addition of casts of historic busts, will be given to Owens College.

The Leeds Municipal Buildings are now nearly complete. An arrangement has been entered into with Mr. Corson, the architect, whereby, in consideration of a payment to him of 400*l.*, he is to carry out and have the entire superintendence of the internal fitting-up and completion of the building. The estimated cost of the internal fittings and furniture of the public offices and the Free Public Library (lighting by electricity excepted) is 9,000*l.*

Raphael's Birthday, which is supposed to fall on March 26, is to be commemorated at Urbino. At Rome the members of the Academy of St. Luke have sought the co-operation of the Academy of St. Cecilia, to enable them to give a *fête* on the Capitol in honour of the day, which will be the fourth centenary.

The Corinth Canal is in progress of execution, and it is reported from Athens that 250,000 cubic metres of material have been excavated and deposited in the sea at the entrance of the isthmus, where breakwaters and other works are to be constructed. No less than forty large buildings have been erected along the route, and a railway for the transport of the excavated material has been constructed.

Wood-Carving.—Free studentships are at present vacant in both the day and evening classes of the School of Art Wood-carving, Royal Albert Hall, Kensington, in connection with the Technical Institute of the City and Guilds of London. Candidates should have passed the examination of the Science and Art Department in second grade freehand drawing, and should be persons who are intending to earn their livelihood by wood-carving. Forms of application and copies of the prospectus of the school may be obtained on application to the manager, School of Art Wood-carving, Royal Albert Hall, Kensington, S.W.

The Forth Bridge.—The report of the Forth Bridge Railway Company, which was read at the general meeting on Tuesday, mentioned that the contract for the erection of the Forth Bridge had been made with Sir Thomas S. Tancred, Arrol & Co., and that the contractors undertook to finish it within five years from December 21 last, the contract price being 1,590,000*l.* The other works, comprising the connecting lines, would be proceeded with only as the bridge approached completion. The works are to be inspected quarterly until completed by Major-General Hutchinson, R.E., and Major Marinden, R.E., on behalf of the Board of Trade.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, FEBRUARY 17, 1883.

APPOINTMENT VACANT.

BIRMINGHAM.—Feb. 21.—The Corporation require the Services of a Surveyor as Manager of Properties in the Improvement Area. Salary, 300*l* per annum. Mr. E. O. Smith, Town Clerk, Birmingham.

in. —Particulars, on personal application, to Mr. BRACKETT,
Estate Agent, 27 High Street, Tunbridge Wells

BUILDING LAND.—Warnford Court, Throg-
morton Street. The whole of this Court to be let on
Building Lease for 50 years. Forms of tender and particulars to
be obtained on personal application at the Clerk's Office, Grocers'
Hall, Poultry.

PADDINGTON WORKS—13, 14, & 15 SOUTH WHARF, PADDINGTON, W.

LINDSAY'S

IMPROVED PATENT

REVERSIBLE TREADS AND LANDINGS

FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK,
Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13, 14 & 15 SOUTH WHARF, W.

The Architect.

THE OWNERSHIP OF ARCHITECTS' DRAWINGS.

THE question is evidently still an unsettled one with architects how far their drawings belong, or ought to belong, to themselves. It is constantly cropping up as a grievance that the Courts of law have theoretically awarded the ownership to their clients, and the decision is declared to be so unjust in practice that every available means ought to be taken to counteract its operation. As matter of fact, there is not one case in a hundred, perhaps in a thousand, in which the architect is deprived of a single scrap of his paper, either double-elephant or foolscap. On the contrary, we could quote instances in which the client has expressly refused to take the plans when offered to be delivered up to him; and we are disposed to regard these as being representative of the true public feeling. Not only so, but we are inclined to think the Courts of law have never really given the decision they are supposed to have given; so that a few words of explanation may suffice to relieve the architectural mind from many misgivings.

The quarrel, it will be remembered, by which the judgment of the Courts was chiefly brought out, was one which had arisen between the late Mr. EDWARD BARRY and the Office of Public Works and Buildings, regarding the Houses of Parliament. The circumstances are worthy of being recalled in a little detail, as it will turn out that the peculiarities of the case made it altogether exceptional. The architect of the great edifice in question was, as everybody knows, Sir CHARLES BARRY. Now there is in the English system of public administration a certain unwritten principle whereby the creator of any sufficiently important national enterprise is permitted, so long as he lives, to be its director. Witness Sir HENRY COLE at South Kensington, who was retained in office, in spite of a whole world in arms, as the *chef de bureau* of the department he had originated, until his voluntary retirement in old age with a pension and a title. At any rate, Sir CHARLES BARRY was no doubt regarded by the Government as the permanent surveyor of his Palace of Westminster; and, had he survived till to-day, it is scarcely possible that his command of the building operations would have been interfered with. Sir CHRISTOPHER WREN, by the bye, was ousted from the control of St. Paul's Cathedral; but it was probably because of a refusal to recognise the failure of his powers at an exceedingly advanced age; and, after all, the dismissal was loudly denounced as a shabby act. Sir CHARLES BARRY, however, died at a little over sixty; and it was found that, in order to provide for his son, he had bequeathed to him in a mass the drawings of the Houses of Parliament, the possession of which would, he supposed, entitle him to the surveyorship of the building. Accordingly, young Mr. BARRY entered upon the duties which his father had been accustomed to perform, and his title was in effect fully recognised by the Government. But the time came when disagreements arose, through incompatibilities of temperament if nothing more, and the Treasury was officially moved to question this title. Eventually Mr. BARRY was informed that the Department of Public Works would take his duties for the future, and he was requested, therefore, to send the drawings of the building to the departmental offices for that purpose. He refused; an architect's drawings, he said, were the architect's property, and the building alone was his client's. Now if the building in question had been of an ordinary size and character, the chances are that the officials would have taken no further trouble in the matter; but the area covered by the Houses of Parliament was so large, and the intricacies of the scientific arrangements so perplexing, that the surveyors could not find their way, and consequently the Government had to apply to the ingenuity of the lawyers for assistance. The lawyers soon discovered the ground that it was necessary to take up. If the architect, they said, were permitted to keep the plans of a building in these circumstances, how could his employer get at the drains? To keep the plans from him

could only be intended to embarrass him intentionally in this and other similar respects; and these documents, in fact, were obviously to be regarded as the mere records or books of certain transactions of business, which an agent had in charge for his employer and must deliver up when called upon. To this argument, which any one who understands building affairs must see was a false issue—for it turned entirely upon the supposition that every drawing produced by an architect must be the record of some secret of construction—the professional leaders unfortunately made an equally fallacious rejoinder. The plans, they said, were the architect's "implements of trade," and nothing more; overlooking the fact that implements of trade are used in one piece of work after another, whereas plans are only used in one. However, the illustration of the drains bore down all opposition; parliamentary debaters and political leading-article writers denounced the selfish trickery of an order of men who laid-in people's drains, and then traded upon the concealment of them; advanced thinkers discovered that more important things than even the drains of the public were in danger, namely, their chimney-flues; and at last shrewd old judges chuckled with laughter at the joke, as they declared it to be almost plainer than the nose on a man's face that the plans of his house were as much his property as the boots on his feet or the nails on his fingers. When lawyers laugh at their own wit it is a pretty sure sign that their logic is loose; but it can scarcely be denied that in the particular case in hand the enforced surrender of Mr. BARRY's plans was an act of substantial justice. The vital peculiarity of the case of the Houses of Parliament, however, was that the plans could not be dispensed with by the officials who were to take charge of a building of such magnitude and intricacy.

But the point of law which was really decided was manifestly no more than this—that an agent must deliver up the indispensable records of his agency; whereas the fact is that the ordinary plans of an architect are not in any way such indispensable records. As regards, for example, the drains, the fallacy is so palpably absurd that it could scarcely be equalled except by quoting the chimney-flues. In most cases, perhaps, the plan of drains originally laid down has been materially modified in execution, and in no case whatever can it be said that the chimney-sweep has the slightest need for the directions of an architect's drawings. When an architect would retain plans in his hands, and refuse to allow them to be copied, for the obvious purpose of preventing another architect, who has been called in as his successor, from understanding the construction of the building, we may say at once that such an artifice is unjustifiable; but, on the other hand, to pretend that there is any practical necessity, as a general rule, for depriving a designer of the custody of those drawings of his design which have ceased to be of any value except to himself sentimentally, is equally wrong.

So far as we can judge from the precise form in which the continued protests of architects against the supposed decision of the Courts are expressed, we seem to be justified in concluding that the true grievance rests upon the idea that plans which are given up to a client may be used, or abused, by some one else. This is a weak fancy at the best, but the influence of it may be easily understood. Indeed, it may be stated as a point of professional etiquette that a man's drawings are to be held sacred by all other men, even if only as a concession to the author's self-esteem. So far we have no doubt the Courts of law would be found to support the case of the architects to the full against clients who could be proved to be animated by ungenerous motives, or even by too great a disregard of considerate and friendly feeling. But further than this it would be dangerous to go. At the same time, we submit that in ninety-nine cases out of a hundred the client cannot possibly have any reason for demanding more than a correct record of the construction of his building for practical reference; and this, it is well known, is not identical with the surrender of the drawings. A plan of the drainage, for instance, ought unquestionably to be supplied in every case of any importance. So also plans and sections of the building generally may be fairly called for, to be "put away with the papers." We ought rather to say it is *corrected copies* that ought to be supplied. But what architect would refuse these? The only question worth asking is whether the trouble of making them ought or ought not to be specially paid for? Again, the whole of the drawings ought to be held subject to a right of examination at any time by any person justly entitled

to refer to them ; but what architect would refuse this ? On the whole, the rights and wrongs of the case are pretty well indicated by the common sense custom, which may be called invariable, exceptions only proving the rule—namely, that the architect is the custodian of his plans, and that the employer is entitled to all copies and all information he may require. And if this is common sense, it is common law.

ESPOSIZIONE DI BELLE ARTI ROME.

[BY A CORRESPONDENT.]

THE much-talked of and long-delayed International Exhibition of Rome has at length been opened. It scarcely justifies the title claimed for it as an International Exhibition. There are few foreign works in it, and those few, for the most part, not at all important. Indeed, Italy itself can hardly be said to be represented in its entirety, certainly not as far as its industrial arts are concerned.

The building is situated on the south-east side of the Quirinal Hill, and faces the Via Nazionale, the new street, the site of which within an easy memory was covered with vineyards and gardens. It has an imposing façade, and is entered by a lofty colonnaded archway surmounted by a group symbolising Art, supported by companion figures of Study and Peace. The vestibule gives into a central hall covered with a dome, from which radiate galleries or chambers in which the sculpture is exhibited. This constitutes the permanent portion of the building, but other and more extensive chambers and galleries have been erected of wood, in which the pictures are hung, and in which the useful arts are represented.

The haste with which the building has been raised, and the want of system in its arrangement and completion, are the source of many inconveniences. Cold and damp, health is endangered by any long stay within its walls. There are also some circumstances of mismanagement which are irritating both to exhibitors and visitors, as, for example, that since the Exhibition has been opened the position of pictures has been changed, from which confusion and dissatisfaction have arisen ; but as this is the first Exhibition of the kind ever held in Rome, it may be hoped that in the promised exhibitions of the future such disorders may be avoided.

Although claiming a more general scope in the character of works for exhibition, by far the largest proportion consists of pictures and sculptures. I shall, therefore, commence a notice of them with the oil pictures, selecting those which more particularly challenge attention.

Before examining the works individually, a few words may not be thrown away in giving some account of the modern Italian school of painting. It is comparatively of recent development in its present form. Twenty years ago a few old-fashioned painters, native and foreign, maintained the old traditions, which, it must be confessed, had long since grown threadbare. Conventional and commonplace transcriptions of peasants in costume, set in country scenes of the Campagna and its environs, formed the main staple of the artist's materials, with which he played as with cards, shuffling them into a feeble and spiritless variety. Not quite so long ago as the period above mentioned, the young Spanish painter FORTUNY became known to artistic circles as offering a new, vigorous, and highly characteristic interpretation of the aspects of humanity and the forms and colours of nature. Gradually he obtained a wider notice. His works were sought for, commented upon, admired, and, finally, gave rise to a host of imitators, many of whom could mimic his style without the fundamental force and delicacy which gave it its peculiar character. The impression was deepened upon the minds of young Italian students by the presence of FORTUNY at the most popular of the model classes—then almost the only one in Rome—where he worked industriously from the figure with the crisp touch and gem-like sparkle which his followers have found so fascinating. From this moment it appears as if the whole sentiment of artistic direction had changed. Qualities were sought which before were unperceived or undervalued. Sharpness of touch, vivacity of delineation, superseded all other aims and objects. Sobriety, breadth, tone, were forgotten in the desire to excel in high colouring and dexterity of manipulation. Thus a school was formed which has diffused itself throughout Italy, and has hardly limited itself to the boundary of the Alps. With such a tendency as this art is sure to be depreciated in many respects. The soul of the master being absent

often nothing but the material body remains, and frequently one scarcely knows whether to be more repelled by the insincerity and superficiality of the workmanship or attracted by the display of so much technical ability, which is at the same time in a great measure thrown away if judged from a proper point of view. The profounder aspects and significancies of nature are disregarded ; those large pictorial qualities which constitute art a language, as contradistinguished from an inanimate mirror for reflecting the appearances of things, ignored and despised. It is thus one sees forced effects of sunlight, false and melodramatic modes of colouring, nature grasped in its outer husk only, the profounder sentiment remaining unrevealed, unknown, untouched, and yet much of the workmanship, as already hinted, commanding attention for the skill and dexterity with which it is executed.

We may now turn to a consideration of the individual pictures of the Exhibition.

Of those pictures which make claims on the attention from their large size—if that, indeed, constitutes any claim at all—perhaps that of the Neapolitan painter, F. P. MICETTI, *The Vow*, has called forth the largest measure of criticism either of approval or disapproval. It is undoubtedly a very remarkable work. I understand this painter is still professionally very young, and has lived much in the wilder regions of the Abruzzi, impenetrable still to nineteenth-century changes, amongst the scenes and people he depicts, which, as in the case of our own MORLAND, WILKIE, and the French MILLET, may account for the graphic energy with which he wields his pencil, and the stern and uncompromising verisimilitude of his representations. The picture is very large, measuring about twenty feet in width by eight or nine in height. The figures are about life-size in scale. It represents the interior of a church lined with spectators and worshippers, on the floor of which crawl devotees, men and women, with their tongues drawn along the pavement—a form of penance not infrequently prescribed in Italy—to be continued from the entrance of the church to the altar or shrine at which the devotions are to be made. The terrible consequences of this ordeal are a fearful laceration of the tongue and mouth, frequent traces of blood being seen on the floor, as here represented. The foremost of the figures in this procession kisses the effigy of a silver head surrounded with a nimbus, which, it may be supposed, contains some saintly relic. It is placed beneath burning candles at the foot of the steps of the tribune. The head exhibits sanguinary traces of the devotions paid to it. On the steps are seated, or lying in the last stage of exhaustion, those who have completed their task. Ghastly, perspiring, bleeding, with glazed eyes, one of these—a gaunt peasant in the foreground—strikes one almost with terror in its unsoftened naturalism. A kneeling priest calmly reads the office. Amongst the spectators are peasants holding lighted candles ; little girls robed in white, veiled, with gilded crowns on their heads. Furthest from the altar a mother holds up her child chuckling with babyish glee, whilst a woman with a basket under her arm weeps bitterly over their heads. Crowds of persons in all attitudes of curiosity and devotion fill up the background.

I have been thus particular in describing this picture, as it is in a great measure expository of the aims and tendencies of the modern Italian school of painting, both in its excellencies and its defects. It is certainly open to very serious criticism ; for, in spite of its robust and nervous force, approaching even to coarseness, there is a want of unity and harmony of treatment by which its effect as a whole is considerably injured. It is called “unfinished”—some of the figures, indeed, are barely indicated—but it is doubtful if additional labour would add to its impressiveness. Indeed, an elaborated manipulation would be more likely to take away from its weird fascination, and might probably weaken its effect. It need hardly be said that it cannot be considered altogether a pleasant picture either in manner or subject, but there is no question as to its artistic claims. Although it may be referred to the Spanish influence in Italy of FORTUNY, it must not be classed as a slavish imitation. It is original both in conception and treatment, highly dramatic, and irresistible in its appeal. The artist exhibits his studies made for this work, which display the same vigorous qualities which characterise the picture.

Another large picture is that of *The Battle of St. Martino*, by M. CAMMARANO. It is scenic and spirited, and shows a right artistic perception in its construction. The group of artillerymen in the foreground are well rendered in form and

solidly painted. The picture justifies its claims as a clever piece of realistic painting. *Siena in the Year 1374*, by P. VANNI, represents the time of the plague in Italy as described so graphically by BOCCACCIO in the introduction to the "Decamerone." Some revellers in the background "make night hideous" with their mistimed merriment. In the foreground one of these revellers is suddenly smitten with the plague. Some nuns and a monk with serious faces come to his assistance. The subject is well and dramatically conceived, and the painting broad in tone and reticent in colour, as the painting of such a subject ought to be. Not so much can be said for the large picture, *Christus Imperat*, by V. LACCETTI, a symbolical representation of the triumph of Christianity, consisting of rather theatrical groupings of iconoclasts, savage converts, and ecclesiastical personages in procession. It is cold, scholastic, and unimpressive. A still larger and much more highly-thought and worked-out picture is the *Homage of Albert, Prince of Prussia, to King Sigismund I. of Poland, on April 1, 1515*, by G. MATEJKO (Polish). This picture, both in choice of subject and manner of painting, reminds one in many respects of the works of Sir JOHN GILBERT, though it is much larger and more ambitious than anything he has ever attempted. It has been most conscientiously studied, and is painted with great care and a high degree of finish for so large a work; but, whilst granting its claims and importance, it must be confessed that its lack of variety in the massing of light and shade detract much from its pictorial value. It is too much in one plane, the whole of it being thrown on the eye at the same moment with more or less equal force and importance. This induces an element of confusion and perplexity in the spectator which destroys the impression of the picture in its totality. A careful study of the large canvases of the Venetian painters, TINTORETTO and PAUL VERONESE, might have taught the artist to correct a defect which, in spite of its thoroughness in other respects, is seriously injurious to a picture of such large dimensions. *The Last Hours of Sieneese Liberty, April, 1555*, by P. ALDI, is worth notice as a serious treatment of an impressive historical incident.

Leaving the larger works, the smaller ones may be taken pretty much in the order in which they occur as to rooms and numbers. As the rooms are small, it will be sufficient to indicate in Roman characters those in which the pictures occur without giving the special number of each picture.

(II.) The works of A. SCIFONI are noticeable for their archæological correctness and historical interest. *Il Cottabo* (The Trial by Wine) shows two lovers standing at some distance from a tazza placed upon a stand. The male lover holds another tazza in his hand filled with wine, which he attempts to throw into the distant one. If the wine of the former should reach the latter it was taken as a good augury; but, should the wine fall to the ground, a bad one. This is carefully painted and well thought-out, but hardly exhibits the highest pictorial qualities by reason of a certain formalism and mannerism, a want of play, and freedom of pencil. Another interesting picture, by the same painter, is a street scene in ancient Pompeii (in Room IX.), in which some mountebanks are exhibiting their performance to a group of shopkeepers and others. A boy standing upon his hands, with his legs in the air and his back to a target, draws a bow and shoots an arrow with his feet, an incident which is figured in one of the wall-paintings discovered at Pompeii. R. FACCIOI, in his picture of *Giacomo Leopardi*, represents the unfortunate poet writing in a chair, supported by pillows and surrounded with books—

dolorosamente
Alla fiocca lucerna poetando.

There is something touching and pathetic in the sad, sick face. It is broadly and unaffectedly painted. D. BELLINI exhibits *A Recollection of Naples*. The foreground is occupied by some amphoræ reared against a wall, with the Bay of Naples in the distance. It is a conscientious piece of realism, though a little prosaic in treatment.

(IV.) *The Return to the Cottage*, of E. SPREAFICO, a girl driving some turkeys down a lane, being harmonious in tone and pure in colour, is, indeed, a pleasant little picture. Two others, the one, *Failing at the Call*, by E. CECCONI, and *A Landscape*, by C. DE SIMONE, may be included in the same category of pleasing cabinet pictures. *Bad for the Receiver*, by L. MONTEVERDE, is noticeable for a clever effect of light conveyed through a trivial subject.

(V.) *A Morning in Verona, Mill on the Adige*, and *The*

Banks of the Adige, by B. BEZZI, all exhibit high qualities of landscape art. They have a quiet reticence and justness of tone, together with a breadth of aspect and careful rendering of effect, which places them amongst the best-studied and most thoughtful works of the kind in the Exhibition. *The Piazza of San Trovaso, Venice, by Moonlight*, by M. DE MARIA, is a very vigorous and truthful study. *Capri*, by S. HAZELTINE (American), shows considerable command of landscape effect. It is airy and luminous, and true to the character of the scene it represents.

(VI.) *Venice*, by G. CIARDI, gives a richly-coloured and effective group of Venetian boats.

(VII.) The Neapolitan painter, E. DALBONO, exhibits several pictures and studies of scenery in the neighbourhood of Naples. The best and most complete of these is *On the Shore at Margellina*, which is very characteristic of the modern Italian school of landscape-painting. It represents a cloudy day, yet filled with the light of a southern sky—so much whiter and more diaphanous than that of northern regions. On a shore of bleached sand groups of fishermen mend their nets, a white range of houses gleaming in the distance with a stretch of sea. It is crisp and sparkling in touch, showing much vivacity and airiness of quality; but at the same time, it must be confessed, it is forced to an almost meretricious degree both in colour and effect of light and shade. It exhibits in compendium the merits and the vices of the Italian mode of treating landscape, giving the sparkle and glitter of the bright sun of the south, but wanting the temperate reticence and seriousness which constitute the chief impressiveness of the landscape to our northern minds. *The Portrait of Signor Costa*, by Sir F. LEIGHTON, is hung so high and so badly that it cannot be seen. As the English school of painting is scarcely represented at all, it is a pity that this picture has not found a better place, even if it were only as a matter of national courtesy. *The Last Touch*, by C. M. ROSS (Norwegian), is a carefully painted and well-studied picture of an artist who cleans his palette and looks with satisfaction at his completed work. The accessories of the background are particularly noticeable for their truth of tone and delineation.

(VIII.) Amongst the best pictures of their kind here must be noticed those of G. FAVRETTO. *A Street in Venice*, and *The Saturday Market in the Campo San Polo*, are very clever and characteristic views of exteriors in Venice, exemplifying much knowledge of effect and an ease of handling which marks a firm grasp of pictorial material and a close familiarity with the scenes represented. *The Piazza of San Marco, Venice*, and *Sta. Maria della Salute* (in Room XVI.), by F. CARCANO, are slight in treatment but effective. The values are justly given and the relationship of the parts well understood. There is no attempt at detail or finish. It may be questioned if such a mode of painting is entirely satisfactory, even from its own point of view, or if its results have the right to be called anything more than sketches of a progressive rather than of an ultimate character.

(IX.) *A Dervish passing over the Bodies of Arab Boys*, by A. AUBLET (French), a painting which appeared in the Paris Salon of 1882, has character in the figures, and the accessories are cleverly given. *On the Alps*, and *In the Valley of Scalve*, by A. FORMIS, are noticeable for a quietness and tranquillity of rendering which is refreshing after the too frequent exaggerations and excesses which constitute so large a proportion of the works here exhibited. *The Pasture*, by D. BOLOGNA, is noteworthy for its Gainsborough-like simplicity and breadth of treatment. There are other pictures by the same painter, which have the like commendable qualities.

(X.) In the picture of A. TOMMASI, *Flowers for the Angelo*, we have two girls carrying flowers fording a stream, with a background of poplar trees, painted with an unaffected simplicity and an absence of pretension of which one would like to see more. The two pictures, *Raffle for a Fowl* and *Chapter First*—the latter a lover presenting a ring to his affianced—are cleverly-given scenes of social life, evidencing considerable power of pencil. *Cold*, by A. COLOSCI, represents some wandering musicians lost in a snowstorm on a hill-side. A girl has sunk down with exhaustion, her pale face turned to the sky in the torpor of death, whilst a boy clings to the distracted father. Traces of footsteps in the snow show their weary wanderings. Their musical instruments occupy the foreground. It is painted with power and mastership. *Daily Bread*, by F. SANTORO, wood carriers on a mountain-side, is remarkable for its rough vigour of execution.

(XI.) G. FATTORI exhibits a *Cattle Fair*, a graphic rendering of a familiar scene in Italy. *The Saltenfyrd*, and *Sommenarch* (in Room XIV.), by the Norwegian painter, A. NORMANN, are scenic and effective representations of northern waters under a rich warm light. *The Refugium Peccatorum*, of L. NONO, is a striking and important work. A forlorn girl is on her knees at the feet of an image of the Madonna, in front of which a lamp burns and a bunch of flowers is suspended. Dead leaves and faded flowers lie on the sodden ground wet with recent rain. The last light of day lingers in the sky and touches the top of the balustrade upon which the image stands with faint orange. The balustrade itself—one of the picturesque features of Chioggia, on the Venetian lagoon—is a masterpiece of technical skill. There is a deep pathos conveyed in the sincerity and truthfulness of this picture, its very simplicity giving force to its impressiveness. It is a large work, and must be numbered amongst the most remarkable and attractive of the Exhibition. *The Lake of Albano*, by F. MOLA, is an effective scenic view of that picturesque basin.

(XII.) *November*, by E. BERTEA, is a meritorious picture representing a girl tending some sheep in an orchard. The effect of a subdued autumn sunlight is well given. In the *Ebb Tide* of E. B. DE MARIA the colour is somewhat forced, but the brilliant sunshine of an unclouded southern sky is well rendered. *Dum Romæ consulitur morbus imperat*, by A. SARTORIO, gives a boy lying stretched upon the ground on a piece of carpet in the Campagna of Rome, slain by malaria, his mother kneeling beside him in an agony of grief. A dreary stretch of the Campagna occupies the background. It is strongly painted.

(XIII.) Of the two pictures by L. DELLEANI, *The Moon Unveiling* is the most pleasing. The light of the moon is just showing itself on a piece of water and its banks with much truth and breadth of effect. The other, representing the interior of a butcher's shop, is a strange contrast in every respect, and is hardly worthy of the same pencil. *A Portrait of Mr. C. C. Coleman*, by G. B. BUTLER (American), is well and delicately modelled in quiet neutral colours.

(XIV.) E. PETERSEN'S (Norwegian) *Michelangiolo, the Earthenware Mender*, is a very strong and vigorous piece of painting of a picturesque-looking mender of earthenware, who carries his implements with him, well known in the streets of Rome. *The Travelling Pedlar* and *Sunday*, by E. FERRONI, are broadly painted and well studied. They appeal very strongly from their unexaggerated truthfulness and frank simplicity of treatment.

(XV.) *Gathering Chestnuts*, by G. BOGGIANI, is a truthful and clever interpretation of nature in its effect rather than in its detail. It represents the interior of a chestnut wood with the solitary figure of a woman with a basket raking the ground. This and the other pictures of the same painter—though this must be considered the best of them—show a profound intimacy with nature in its open-air aspects, felt rather than imitated, or even actually expressed. They are highly praiseworthy in this respect. As the artist is very young he may be expected to take a prominent place amongst intelligent landscape painters. The pictures of A. VERTUNNI, the Roman landscape painter, *In the Wood* and *On the Roman Campagna*, show power and command of material. *The Roman Campagna* is perhaps the soundest and most frankly painted of these. *The Reception of the First Italian Embassy in Morocco beneath the Walls of Fez*, by C. BISEO, is woolly and scantily studied, though the effect of the bright sunlight is effectively given. This picture will be disappointing to those who remember the clever illustrations furnished by this artist (who accompanied the expedition) to DE AMICIS'S book giving an account of the journey.

(XVI.) *The Solitary Statue*, by M. CALDERINI, is a good study of trees against a dull, cold sky, at that season when "leaves be few or none." The other works of the same painter show study and observation of effect. P. JORIS sends *The Flight of Pope Eugenius IV.*, who, dressed as a Benedictine friar in a boat on the Tiber, is threatened by enemies. It is strongly painted and broadly treated, but rather theatrical and strained in the action of the figures.

(XVII.) ALMA TADEMA is represented by three pictures, *A Painter's Studio*, *Studio of a Roman Sculptor*, and *The Vintage Festival*—works too well known to need more than mention here. *Pope Alexander VI. asking the Alliance of the Venetian Republic*, by F. JACOVACCI, is sincerely painted. The bland importunity of the Pope contrasts with the sour reserve of the Venetian envoy. The white-robed girls of S. VANNUTELLI

are wanting in study and refinement. His *Procession in Venice*, consisting of a number of ecclesiastics and others, who pass the Giudecca by a bridge of boats, is suggestive of the fresh air and of light wind; but it is unequal and heavy in parts, especially in the sky, which lacks transparency.

(XVIII.) G. DE SIMONI, in his *Convulsionaries*, exhibits a wild scene of oriental fanaticism, painted with spirit and verisimilitude. The *Darkness and Light* of E. SIEMIRADSKI (Polish) will disappoint those who have seen his *Christian Martyrs in the time of Nero*. It is a large allegorical work for the decoration of a ceiling, and represents the contest between the genii of good and evil. It hardly bears any traces of the power displayed in the picture which first brought the painter's name into general notice.

Before leaving the oil pictures, a word of protest may be made against the curious and bizarre frames which ignore or destroy the effect of so many of them. Some of these frames are made in imitation of bronze, bark, branches of trees, and other inappropriate materials. Some are clamped with imitation metal, twisted with real leaves and branches. These and many other fantastic designs serve to disfigure the pictures they were intended to ornament. One would think that the obvious tendency of such devices to distract attention from the picture, even if they were in themselves good, would be sufficient to suppress them.

Passing in review the water-colours, we have a clever, crisp study of the hill-side Umbrian town Assisi under a diffused light, by B. G. FILOSA. A. GLENNIE (English) gives an interesting study of a Byzantine screen in his *Interior of a Greek Church at Pola*. *Gourds*, by V. MONTEFUSCO, are given in a shadowy softness, with an accent here and there. This and the other drawings by the same artist have a certain dainty prettiness, though somewhat meretricious. *The Portrait of an Old Man*, by F. TEPA, is noticeable for its character, breadth, and tone. *A Driver*, by A. SOMINETTI, represents a deformed dwarf driving turkeys. The same painter gives two interiors. They are free and clean in touch, but rather too slight, and want care and study. F. FASCE, in his *Study from the Life*, gives us heads of an old woman and a child, characteristic and well-modelled. Two marine views, *Naples and Venice*, by E. DALBONO, are bright, sparkling pieces of colour, but are too merely ornamental and unsound to have much value. *Hemp-dressers*, by D. PENNACHINI, has good qualities, though there is a certain incompleteness in the treatment which renders it not quite satisfactory. *The Festa Day*, by L. BORZINI, represents three girls singing along a country road, rendered with ease and spirit. *The Forum of Rome* and *The Temple of Vesta*, by P. H. RIVIERE (English), are light and facile in treatment. The Forum wants force in the foreground. H. COLEMAN (English) has several clever drawings. One represents an omnibus-horse fallen in the street on a wet day; another, *A Funeral* in the Campagna of Rome. The Brothers of the Misericordia carry a coffin, whilst a mercante di Campagna on horseback removes his hat. There is a rough force in the latter which reminds one of the works of DAVID COX. The subject would bear more elaboration and a more serious treatment. He has also an Alpine summit, well and carefully painted. He exhibits evidences of considerable power and ability. *Prayer*, by N. CIPRIANI, is a masterly study of a Mussulman standing at his devotions. A boy, seated on a carved chair, called *A Sketch*, by S. GIOZZONE, is noticeable for a clever management of broad washes. V. CABIENCA sends several works. The best are, *A Street Scene at Rocca di Papa*, the quaint village near the Lake of Albano, serious, gloomy, and effective; *A Caligo in Venice*, a narrow canal with two gondolas, with an atmospheric effect in low-toned, warm greys; *The Dawn of Day*, a canal with arches, under which the day breaks faintly, paling the light which the gondola carries. All these are distinguished by his usual solid treatment, rich colour, and breadth of effect. The works of L. BAZZANI are all worthy of careful examination. *A Fountain of Pompeii restored* is painted in a highly meritorious manner, careful and true. The two figures are a little thin and insubstantial. Miss RHODA HOLMES' (English) *Fondamenta della Tana*, in Venice, has some hint of Turnerian brightness, but is somewhat out of tone. *For Amusement*, by D. BUCCIARELLI, represents a woman tickling the nose of a sleeping cavalier with a straw. It is firm in touch and masterly in handling, although the colour is forced and the composition commonplace. P. JORIS has a good study of *The Temple of Antoninus and Faustina*, by the Forum. The columns and frieze with their weather-stains are well given.

The sky and the figures are a little heavy. *An Egyptian Mendicant*, by U. SAMARAN, has a good effect of light and is well studied. ALMA TADEMA has two small drawings, *A Request* and *The Stairs*. A. MUZIO exhibits some clever pastel studies.

With these notices may be closed the inspection of the pictorial part of the Exhibition.

ACTIONABLE NUISANCES.

[BY A BARRISTER.]

THERE are few questions of such importance and interest to the general public as to which so much misconception exists as the rights and duties respectively of neighbouring owners of property, and the obligations which the law imposes with regard to the manner in which such property should be used.

A case was recently heard before the Court of Appeal, which forcibly illustrates the difficulties of attempting to define a man's duty towards a neighbour whose occupation or calling is absolutely incompatible with neighbourly relations. A student would find it difficult, if not impossible, to devote his mind to study if his next-door neighbour should keep a printing-machine at work at all hours of the day or night. The physician, the surgeon, or the artist would find it equally impossible to pursue their avocations in a locality devoted to noisy trades. But it is evident that the same rule of reasoning could not be made to apply to Whitechapel as to Belgravia. What might be fairly considered the ordinary avocation of a man in Whitechapel could not be regarded as an ordinary incident of life in Belgravia. The same principle could not be applied with logical strictness to the two localities.

Lord Justice THESIGER has in fact insisted that the principle is the same, but its application should be controlled by the time and circumstances of the case. For instance, it would result in the most serious practical inconvenience if a man might go, say into the midst of the tanneries of Bermondsey, or into any other locality devoted to a particular trade or manufacture of a noisy or unsavoury character, and by building a private residence on a vacant piece of land put a stop to such trade or manufacture altogether. The case is also put of a blacksmith's forge, built away from all habitations, but to which in the course of time habitations approach. Lord Justice THESIGER did not think that either of these cases presented any real difficulty. As regards the first, it may be answered that whether anything is a nuisance or not is a question to be determined, not merely by an abstract consideration of the thing itself, but in reference to its circumstances. What would be a nuisance in Belgrave Square would not necessarily be so in Bermondsey, and where a locality is devoted to a particular trade or manufacture, carried on by the traders or manufacturers in a particular and established manner, judges and juries would be justified in finding, and may be trusted to find, that the trade or manufacture so carried on in that locality was not a private or actionable wrong. As regards the blacksmith's forge, it would be, on the one hand, in a very high degree unreasonable and undesirable that there should be a right of action for acts which are not, in the present condition of the adjoining land, and possibly never will be, any annoyance or inconvenience to either its owner or occupier; and it would be, on the other hand, in an equally degree unjust, and from a public point of view inexpedient, that the use and value of the adjoining land should, from all time and under all circumstances, be restricted and diminished by reason of the continuance of acts incapable of physical interruption, and which the law gives no power to prevent. The smith, in the case supposed, might protect himself by taking a sufficient curtilage to insure what he does from being at any time an annoyance to his neighbour; but the neighbour himself would be powerless in the matter. It is admitted that individual cases of hardship might occur in carrying out this principle; but, on the other hand, the negation of the principle would at the same time produce a prejudicial effect upon the development of land for residential purposes. It will be seen therefore that, in the interests of the public as much as in private and individual interests, it is important to consider how and under what circumstances a man may restrain his neighbour from carrying on a trade in such a way as to be a nuisance and injurious to him or his property.

In the case to which we have referred the plaintiff and defendant were neighbours, and held leases under the same landlord. The defendant was a wheelwright, and since the year 1848 had carried on his trade upon the premises adjoining those of the plaintiff. The plaintiff, in the year 1875, entered into occupation of his house, which had previously been used, first, as a furniture maker's workshop, and as to the part immediately adjoining the defendant's premises, as a gasfitter's and smithy. This portion of his premises the plaintiff converted into an artist's studio, and after the lapse of four years complained of the increased noise caused by the defendant in carrying on his business. The defendant made attempts to lessen the noise and abate the nuisance complained of, but apparently without succeeding in satisfying the plaintiff, who eventually brought his action. It was alleged by the plaintiff that the noise caused by the defendant amounted to an actionable nuisance, and there seems to have been no doubt on the evidence that this was so. The Court accordingly granted an injunction restraining the defendant from carrying on his business in such a manner as to cause a nuisance to the plaintiff, and the Court of Appeal suspended the injunction for a month in order to give the defendant time to make alterations, so as to abate the nuisance or find new premises.

The facts of this case present no very unusual features, but they serve, nevertheless, to illustrate the danger which a man incurs who, engaged in any trade or occupation likely to cause annoyance to his neighbours, invests his capital on the assumption that he will be allowed, on the faith of his business having been for many years established, to continue it without interruption. The noise made by the defendant in his business did not amount to a nuisance until the plaintiff converted the old smithy into an artist's studio, and when this portion of his house came to be used for the purpose for which it was intended, the noise made by the defendant in carrying on his business became a nuisance to the plaintiff. It has often been urged under such circumstances that a man may acquire by user a right to create a noise even amounting to an actionable nuisance; but it is well to bear in mind that user of this kind, in order to support such a contention, must neither be forcible user nor user by stealth, but must be open and of right. Now a man cannot, by anything he can do on his own property, prevent his neighbour from making a noise. If he enter on his neighbour's property for the purpose he becomes a trespasser. In the case referred to the plaintiff could not even have taken action, for the reason that the noise did not become an actionable nuisance until the studio was erected. It did not hurt anybody so long as the plaintiff's premises were not required for artists' purposes. The plaintiff therefore could not have prevented the noise from continuing by action; neither could he have physically prevented it, for a man has no more control over the waves of sound than he has over the wind. No easement or right by user had, therefore, been acquired by the defendant in the present case.

As a further illustration of the principle adopted by the Courts in dealing with questions of this kind, it may be well to mention a case decided a few days ago, in which the facts were very similar to the present. A confectioner had for more than twenty years used a pestle and mortar in his back premises, which abutted on the garden of a physician, and the noise and vibration were not felt as a nuisance, and were not complained of. The physician erected a consulting-room at the end of his garden, and then the noise and vibration became a nuisance to him. He accordingly brought an action for an injunction. The defendant pleaded that he and his father had carried on the business, which, by the way, was in Wimpole Street, for more than sixty years, and that he had acquired a prescriptive right by user to continue to do so. It was held, however, that inasmuch as the noise did not become an actionable nuisance until the plaintiff erected his consulting-room, no such right existed, and that the right to make a noise so as to annoy a neighbour could not be supported by user unless during the period of user the noise had amounted to an actionable nuisance.

This decision is founded, as in the former case, upon the principle that user which is neither physically capable of prevention by the owner of the servient tenement, nor actionable, cannot support an easement. We are still, however, as far as ever from arriving at a clear conception of what an actionable nuisance is. We are told that regard must be had not only to the thing done, but to the surrounding circumstances. What might be a nuisance in one locality might

not be so in another. The truth of this latter observation is self-evident; but we are not in any way, while admitting its truth, enlightened as to the nature of the circumstances which will permit a man to cause a nuisance to his neighbour in one locality or the other. One would have thought that an artist who voluntarily selected a house which had been used, first, as a furniture maker's workshop, and, secondly, as a gasfitter's smithy, could not have much to complain of if his neighbour was a wheelwright who found it necessary to make a noise in carrying on his business. On the other hand, the wheelwright might have a good deal to complain of in the artist who selected the old gasfitter's shop, where a trade as noisy as his own had probably been carried on before, and dedicated this uncongenial spot to the Muses. Surely such an erratic selection might be regarded as "a circumstance" worthy of consideration in determining whether the wheelwright's business was a nuisance or not.

It may be urged, and doubtless with some degree of truth, that to allow the continuance of a nuisance would be to discourage, if not altogether to prevent the development and improvement of the property in the neighbourhood. But wheelwrights are as necessary to the community as artists, and we should hardly suppose, from what appears on the evidence to be the character of the property in question, that the wheelwright's business was at all out of place, or that the artist's studio was likely to be any permanent improvement upon the gasfitter's smithy. The rapid increase of building operations in our large towns, and the constant changes, often difficult to account for, in the character and value of house property, and the uses to which it is devoted, render considerations such as those to which we have adverted of the utmost importance in determining the merits of cases of this kind, and it would almost seem that such "local circumstances" were not sufficiently taken into account in determining upon the respective claims of the artist and the wheelwright in the case we have quoted.

PARIS NOTES.

THE official regulations for the Salon of this year have just been published. The opening is fixed for May 1, and the close on June 20, as in former years. The only change in the rules relates to the reception of the works, which will commence a fortnight earlier than in 1882, viz., for the section of painting, drawing, &c., from March 5 to 15; for the section of sculpture and engraving, from March 21 to April 10; and for that of architecture, lithography, &c., from April 2 to 15. The Salon Catalogue Committee met last Saturday to receive tenders for the monopoly of this volume. There were eight competitors, and MM. Bernard & Co., printers, secured the execution of the work, at the price of 31,500 francs, which they will pay over to the Association of French Artists.

The annual Exhibition of Painting and Sculpture held at the Cercle des Arts Libéraux, in the Rue Vivienne, opened last week, and will continue until the 20th of next month.

The Musée des Arts Décoratifs will reopen on March 1. Three Salles are likely to be especially interesting—two devoted to the collection of M. Lepic, who has just returned from a prolonged visit to Upper Egypt, Nubia, and the interior of Africa, bringing with him a number of water-colour sketches of the Upper Nile and a series of oil paintings executed from nature in the same country. In addition to these, M. Lepic will exhibit many other of his works that have not yet appeared before the public, as well as numerous articles—furniture, utensils, stuffs, and arms from Central Africa. Another room will contain the decorative works of M. James Tissot—paintings, mosaic enamels, *eaux-fortes*, &c.

The Government appear to have absolutely decided on the opening of the first Triennial Retrospective Exhibition in the month of September next, and have already published information respecting the conditions and regulations of the Exhibition, the sending in of works, &c.

The second Exhibition of the Union des Femmes Peintres et Sculpteurs was opened last week at the Palais de l'Industrie. The jury of admission have perhaps shown undue tolerancé, but, on the whole, the Exhibition is good, and a decided advance upon that of last year. The most interesting of the works on view are *Fruits*, by Madame Murator; *Les Deux Marines*, by Madame La Villette; *Les Landes du Morbihan*, by Madame Espinet; *La Bas*,

by Madame F. Schneider; and two landscapes from the brush of Madame Aunalz. Among the sculpture may be mentioned a bronze by Madame Léon Bertaux; *Spring*, by Madame Edouard Lepelletier; and a group entitled *An Offering to the Conqueror*.

At last Saturday's meeting of the Académie des Beaux-Arts, M. Bonnat read a paper on the life and works of his predecessor, M. Leon Cogniet. MM. Fackin (of Brussels), Bégas (of Berlin), and Civiletti (of Palermo), all sculptors, were proposed by the Sculpture Section as candidates for the place of corresponding member of the Académie, vacant by the death of M. Guillaume Geefs, the Belgian sculptor; while M. Henriquel, on behalf of the Engraving Section, proposed the following candidates for the succession of the similar post held by the late M. Franck, of Brussels:—MM. Paul Girardet, copper-plate engraver, of Moudon, near Lausanne, Tautenhayn, medallion engraver, of Vienna, Biot, copper-plate engraver, of Antwerp, and Starke, medallion engraver, of Vienna. The elections take place to-day, the 24th inst. It will be remarked that there is not one English candidate among the seven nominated.

The Municipal Council of Lille invite architects to send in plans for the erection of a Fine Arts Palace in that city, the funds for which have been raised by means of a lottery. All architects residing in France may compete.

The Minister of Public Instruction and Fine Arts has just presented to the Institute the busts of those of its members who died during the past two years:—In the Académie Française, MM. Duvergier de Hauranne, Littré, Dufaure, Barbier, Charles Blanc; in the Académie des Inscriptions et Belles Lettres, MM. Mariette, Paulin Paris, Dulaurier; in the Académie des Sciences, MM. Chasles, Delesse, Henri St. Claire-Deville, Bouilland, Liouville; in the Académie des Beaux-Arts, MM. Cogniet, Lefuel, Gatteaux, Reber, Lehmann; in the Académie des Sciences Morales et Politiques, MM. Peisse, Giraud, Massé, H. Passy, Joseph Garnier, Drouyn de Lhuys. According to immemorial usage, the Secretary of the Institute, immediately after the death of an Immortal, has to order a bust of the deceased, which is placed in one of the niches of the Salle des Séances of the body. As, however, these niches are of very limited number, every time a new bust is added one of its predecessors has to be removed and relegated to the *greniers*, or lumber-rooms of the building, which by this time must be getting filled up with these "counterfeit presentments" of the illustrious dead.

The Municipal Commission, recently appointed to study the problem of improved dwellings for the working population, held its first meeting last Saturday, under the presidency of M. Bouteiller, municipal councillor. The business transacted consisted in fixing the plan to be followed in the investigations of the body, and it was decided, (1) to find out and classify those unoccupied sites belonging to the Communes in the poorer quarters of the city, the most suited for the construction of cheap tenements; (2) to establish the conditions, plans, &c., of the proposed buildings; and (3) to arrange for the carrying out of the work.

It is proposed to construct a new bridge across the Seine, about half-way between the existing Pont-de-Grenelle and that at the Pointe-du-Jour, to form a direct means of communication between Auteuil, on the right bank, and the important manufacturing quarters of Javel and Vaugirard on the left. The bridge is to be named after Mirabeau, the great orator of the first National Assembly, and will make the seventeenth constructed or entirely rebuilt within the last thirty years; the other sixteen, taking them in order down the river, being the Ponts National, de Tolbiac, de Bercy, de l'Archevêché, au Double, de la Cité, Saint-Michel, Louis-Philippe, Notre Dame, au Change, de Solférino, des Invalides, de l'Alma, de Passy, de Grenelle, and de la Pointe-du-Jour.

A numerous body of men have been at work during the past fortnight on the new gallery—upwards of 110 feet long—in the Musée de Cluny, which it is intended to throw open to visitors in the course of April next. Among the art treasures and curiosities it is destined to hold may be particularly mentioned the magnificent tapestries of the Hôpital d'Auxerre, and also those of the Château de Boussac, in the Department of the Creuse, alluded to by George Sand in one of her novels. These tapestries, which depict the armed revels, tournaments, and other scenes of mediæval chivalry, are generally considered by connoisseurs to be the finest in the country. Some of the pieces, owing to long-continued neglect, had fallen into a very bad state, and have been restored by means of a new method, which, though long in execution, has

so admirably succeeded that they have regained almost their pristine freshness and brilliancy. In the same gallery will be arranged the wonderful collection of shoes and foot-gear of all nations got together by the late M. Léon Jacquemart, and bequeathed by him to the museum.

A portrait of Jean de Bourbon, Comte d'Enghien (1528-1557), believed to be by Fr. Clouet, and in a good state of preservation, has just been purchased at the Hôtel Drouot for the Musée du Louvre. The price paid was 6,000fr.

DECAY OF BUILDING STONES.

A PAPER by Professor A. A. Julien, of Columbia College, was lately read before the New York Academy of Sciences, in which he stated that in that city 11·6 per cent. of the houses have stone fronts, mostly of sandstone. The relative proportions of stones used in buildings are as follows: Brown stone, 78·5 per cent.; Nova Scotia sandstone, 9 per cent.; marble, 8 per cent.; granite, 2 per cent.; Ohio sandstone, 1·5 per cent.; gneiss, 1 per cent. The number of brick buildings forms 63 per cent. of the total; frame houses, 24 per cent.; stone, 11·6; iron, 0·9.

The effects of weathering upon building stones has received less attention in modern times than it deserves, and very few modern buildings will last a thousand years, while many of them will be gone before their own architects are dead. In cities the weather produces a different effect on stones from what it does in the country. Marble suffers from three causes: it dissolves on the outside and is washed away, it undergoes internal disintegration, it also bends and cracks, as was found by Professor Geikie, who has studied the effect of weather upon tombstones in Scotch graveyards. Some architects have said that brown stone is no better than gingerbread to put on a house; it adds nothing to its strength, and in sixty or eighty years all the sharp corners will be rounded off. Some houses less than ten years old show signs of decay, especially where Lockport limestone was used. Lenox Library began to decay before it was finished. The time that granite will last depends on the climate. An obelisk that stood for forty centuries in Egypt, after removal to Paris was full of cracks in forty years, and probably will not last four hundred years. How long will the one last that has been imported and set up in a most exposed location in the Central Park, New York? Nova Scotia and Ohio sandstones soon become stained and streaked, and marble sometimes crumbles on the surface so that it can be scraped off, as that in the Cathedral on Fiftieth Street.

The enemies of building stones are of three kinds—chemical, mechanical, and organic. Of the chemical agents there are the acids which dissolve carbonates, such as sulphurous and sulphuric, from combustion and from the decay of organic matter; there is carbonic acid from the air, nitric acid in summer showers, hydrochloric acid is always present near the sea, and, besides these, carbolic and hippuric acids are in rain-water. We do not know what there is in the air of New York City; it has never been analysed. There must be some effect produced by the oxygen, ozone, ammonia, and sodic chloride in the air. Among mechanical agents we have frost. In the climate there is a variation of 120 degs. in the temperature within the year, and sometimes 70 degs. in a day. The action of wind alone, or carrying sand and street dust, causes friction. Crystallisation by efflorescence and pressure are other causes of decay, but too much stress has been put on the crushing test. Fire is another destructive agent. Among organic agents we have vegetation on land and the marine animals in the water. John C. Draper maintains that certain lichens grow on houses in streets running east and west; but the speaker had never seen any lichens, although *confervæ* are quite common in the city. The influence of lichens is a point still in dispute; some say they preserve the stone, others that they injure it. A load of Italian marble sunk in our bay was destroyed by boring animals, and the piers of the Brooklyn Bridge may suffer from the same cause.

Among the internal elements of durability or the reverse is the chemical composition, such as solubility, also the influence of liquids in cavities, and as water of hydration; changes in the degree of hydration are continually going on. Also physical structure of the stone. Mica is an element of weakness. Porosity enables the frost to penetrate deeply, as often seen in the lintels and doorsteps of brown stone houses. In light coloured stones, streaks form, white fluorescences, or black stains from soot, &c. Manganese also forms black stains, *confervæ* green ones. Hardness and crystalline structure are elements of permanence, also homogeneity. Much often depends upon the character of the surface. Smooth polished granite decays more than that which has not been polished. The position with reference to prevailing winds and rain is also an important factor.

Most of the tests are antique and unworthy of notice. Some idea can be obtained from an inspection of the "out-crop" at the quarry itself. Also, by examining old masonry and tombstones. Dr. Julien examined the gravestones in Trinity Churchyard, and found that the red sandstone, like that of which the church is built

(from Little Falls, N. Y.), stood the best, and is superior to any sandstone now used in the city. The old test by dipping the stones in sodic sulphate and letting it crystallize, and repeating this twenty or thirty times, is fallacious, as it cannot be compared to frost. If dipped in water and frozen, and this repeated fifty times, the result is almost imperceptible. Other tests were mentioned, such as heating to 600° and putting in water, acid vapours, &c.

The following means of protection and preservation were suggested:—

1. Selection. In no quarry is the stone so good that all of it ought to be used; but it is used indiscriminately.
2. Seasoning. When allowed the stones he used to lie three years on the sea beach.
3. Position in regard to its lamination. It should lie on its natural bed.
4. Shape of the projections.
5. Artificial protection, such as paints and oils. The best protection for limestones is water glass. For sandstones, it must be mixed with baric or calcic chlorides. It has been tried in some other countries, but not here. If oil is first applied, it prevents the use of water glass for ever after. The objections made to the use of the stone, the speaker thinks not well founded, and here, where it is so abundant and accessible, it should be used much more than it is. The lecture was illustrated with lantern views.

THE GERMAN TIMBER TRADE.

THE proposal to levy higher duties on foreign timber imported into Germany, now under discussion in the Reichstag, naturally excites much attention in the Thuringian States, as the forest returns form a very considerable part of the revenues of the States and their rulers. The gradual and serious falling-off in the annual income derived from the State and Domain forest has for some time been a cause of anxiety in the Duchy of Gotha.

The budget of the ducal domains in Gotha shows a revenue of 87,883 $\frac{1}{2}$ and an expenditure of 62,447 $\frac{1}{2}$. The surplus is consequently 25,436 $\frac{1}{2}$.

This surplus, which is divided in equal shares between the State and the reigning Duke, shows, when compared with the previous budget, an estimated decrease of revenue to the extent of 11,280 $\frac{1}{2}$, entirely due to a falling-off in the returns from the forests. The immediate cause of this decrease is the present price of timber and fuel in the German markets. The average price of wood in the Gotha market is 11·48 marks per cubic metre, as compared with 12·79 marks in 1879, and this last figure showed a considerable falling-off from the prices realised in preceding years.

At a meeting of German foresters held at Coburg in August last, it was resolved by a large majority of votes to represent to the Imperial Chancellor the necessity of taking steps to enable the native forests of Germany to compete favourably in German markets with the produce of the Russian, Austrian, and Swedish forests. It has also been stated that Austrian timber can be sold cheaper at Gotha than timber felled in the Thuringian forest. It is universally believed that the present state of things can only be remedied by protective measures. Wood prices were as low, or even lower, than at present thirty years ago, and the subsequent rise was not in any way due to restrictions on the introduction of foreign timber, but more probably to the increased, and, as it has turned out, temporary demand for timber for large building or other undertakings. Unfortunately, most of the large forest proprietors considered that an unusually long series of good years warranted them in regarding the increased value of their forests as a permanent one, and arranged their budget of expenditure accordingly. The advocates of protection argue that the annual value of the forests is not one that can safely be left to adjust itself by the sole standard of free competition. They assert that foreign competitors are only enabled to swamp the German timber market with their produce in consequence of the reckless and destructive system, or rather want of system, of silviculture practised in many parts of the chief timber-producing countries of the Continent. Free competition under these circumstances, they state, would inevitably lead to a gradual deforestation of a very large part of Germany, and possibly conduce to bring about the same disastrous results which have been lately witnessed in the Tyrol, where the recent calamitous inundations are ascribed in a great measure to the wholesale destruction of forests that has been going on in that country for some time past. They insist that, under the sound system of forest cultivation at present followed in Germany, it is absolutely necessary that the annual returns of the forests must be maintained at a level which will enable the proprietor not only to cover his annual outlay on working and renewing his forests, but also yield him a profitable return, otherwise the land would have either to be utilised for some more profitable crop, or its forests supported at the cost of the State for their sanitary and protective uses.

Messrs. Robert Boyle & Son are at present applying their system of ventilation to the new Grand Theatre, which is in course of erection in Upper Street, Islington.

NOTES AND COMMENTS.

SIR T. G. FROST has presented the Town Council of Chester with eight portraits of Earls of CHESTER, which were formerly in the possession of Sir THOMAS S. M. STANLEY, Bart., of Hooton. The portraits are supposed to be at least three centuries old; but, whatever may be their interest to Chester, they are not more trustworthy than the portraits of the Scottish monarchs in the palace of Holyrood, as the earls represented lived in the eleventh, twelfth, and thirteenth centuries.

THE Parliamentary Paper respecting the death of Mr. C. OGLE, architect, five years ago in Greece, is a memorial of him of which his friends may well be proud. Mr. OGLE suffered through his kindness of heart and sympathy with the weak. During the insurrection in the neighbourhood of Macriniza Mr. OGLE was an unarmed spectator of the warfare on Mount Pelion, and was intent only on fulfilling his duty as a newspaper correspondent and in saving the lives of the defenceless. He went about the mountains violently blaming whichever side committed cruelties in the wild warfare, Greeks as well as Albanians. After two or three days the Albanians and Turks retreated, and on their way occupied some strong positions, from which they kept up firing against the unarmed inhabitants, who were flying in all directions. Mr. OGLE, seeing the slaughter, resolved to appeal to the Pashas, and while on his way, alone and unarmed, he was killed by some Turkish soldiers. It was characteristic of him that, a little time before his death, he wrote a note in pencil directing that provision should be made at his cost for the women and children he had just rescued.

THE publication of "Tom Brown's Schooldays," and the "Scouring of the Valley of the White Horse," has made many people aware of the existence of the "White Horse" that is to be seen on Ashdown Hill. But there is danger that this work, which if not of a high class is at least of a great age, will become invisible. The local antiquarian societies have resolved to address a memorial to the Earl of CRAVEN, the owner of the hill, calling his lordship's attention to the importance of a re-scouring of the "White Horse" in order to preserve it. The expense cannot be great, and should his lordship decline, Mr. THOMAS HUGHES, if he exercised his influence, would have no difficulty in obtaining subscriptions for the operation.

At a time when people who live near the Thames and the Medway are suffering through the floods, and when so many remedies are proposed, it is worth while to listen to what an archæologist has to say on the subject. Mr. C. ROACH SMITH says that much of the damage is due to the tides, which have not been provided against by embankments. "With our own eyes," he says, "we have seen and pointed out for a long time this increased tidal action, affecting the property and health of the people of Rochester and Strood; of the latter place especially, for by the culpable, and we may say, criminal neglect of the Corporation and the Dean and Chapter, the inhabitants of Strood have to breathe the poisonous atmosphere engendered by the percolation of the Medway's brackish water flowing periodically through privies and cesspools, and stagnating in cellars for the summer's heat to render it still more pestilential. Archæology, had it been listened to, might here have saved hundreds of lives and thousands of pounds in property." There is something to be said in support of Mr. SMITH's theory, and it is possible that one of the causes of the floods in the Thames Valley is the impediment that is offered to the passage of the water by the volume of tidal water in the river, which somehow appears to increase.

THE District Railway Company stole a march on the Metropolitan Board of Works and the Corporation of London when the sanction of Parliament was given to a proposal to erect colossal ventilators in the Embankment Gardens and in Queen Victoria Street. The counsel, parliamentary agents, engineers, surveyors, and solicitors representing those bodies, must have been all asleep when the clause was considered, which permitted the erection of ventilators, 90 feet long, 20 feet wide, and 20 feet high, in the gardens of the Embankment, and in the middle of the roadway. Captain DOUGLAS GALTON, who was the referee in the matter, could only interpret the Act in the way that was originally intended by the railway company when the Bill was deposited. It is now proposed to introduce a Bill into Parliament in order to obtain some modification of

the arrangement, but unless the Metropolitan Board are unusually fortunate, it will be difficult to have the former Act set aside.

THE Scottish judges have not yet decided whether a railway company is within its rights in purchasing in Glasgow only the substratum in streets, and is without obligation to take the buildings on the surface. According to the company, it is practicable to bore beneath houses without risk to them, but this is denied by the owners, and the case has yet to be tried. Lord FRAZER, who declines to decide without a special inquiry, proposed to hear the case on March 3, but on application the date has been left open, with a view to the settlement of the question. The Glasgow company may be over-sanguine in anticipating that the line can be constructed without injury to the houses. In London the greatest care has been taken to avoid the least interference with the valuable property in the neighbourhood of the extension of the Underground Railway, which is now in progress. But as it is easy to set up claims for damages through settlement, the contractors have taken the precaution to obtain photographs of all the property along the line. In Glasgow the railway is to be constructed in a difficult soil beneath houses, and yet it is supposed the operation can be conducted without detriment to the properties.

THE tunnel under the Mersey is advancing towards completion. The headings now reach a total length of 717 yards, of which about 182 yards are under the Mersey, and they are being lined as they proceed. The excavations for the main tunnels have proceeded to a total length of 1,054 lineal yards, and have been lined with brickwork for a length of 939 yards. The sandstone rock continues of the same satisfactory character. In order to expedite the work, arrangements have been entered into for excavating the heading on the Birkenhead side by means of a machine designed by Colonel BEAUMONT, driven by compressed air. A preliminary trial has been made in the sandstone rock on the surface, which gave good results, and from which Colonel BEAUMONT estimates that a speed of 30 lineal yards per week can be attained. The contractor, Mr. WADDELL, expects to have the work completed within the specified time. It is proposed to construct lines from the tunnel to the railway stations in Liverpool and at Birkenhead to the docks.

WHEN the Chambers of Commerce are found to be taking up technical education there is little doubt that the country is no longer indifferent to the subject. At the meeting which was held in London on Tuesday of the Associated Chambers, a resolution was adopted which was as follows: "That it be an instruction to the Executive Council to collect and circulate amongst the Chambers information respecting the aid given by Continental Chambers and other trade associations in promoting technical instruction, and in regard to the effect on the manufacturing and commercial interests of the several countries." Mr. SWIRE SMITH, one of the Royal Commissioners, was present, and his description of the efforts made in Continental cities to secure the trade which at one time belonged to England, had something to do with the success of the resolution.

THE courage with which foreigners are invading English fields of manufacture is suggested by what Mr. WOODALL, M.P., another of the Royal Commissioners, said at the Longton Art School. In Hütten Steinach, in Germany, he saw, as he had previously seen at Bonn, the familiar china mugs painted with wreaths of flowers and embellished with gold scrolls and lines, lettered in English, "A present for a good girl," and sold at 2½d. each. There were also teapot stands, with English inscriptions, such as "A present from Brighton," decorated in like manner, to be had for 6d. At Sonneberg Mr. WOODALL visited Herr CHRISTIAN SELTNER, a modeller. His studio was full of small portrait models and moulds of all modern notables. When public opinion was attracted in the Old or New World to some man of distinction—when Lord BEACONSFIELD went to Berlin, or Mr. GLADSTONE to Midlothian, or when Dr. DARWIN died—Herr SELTNER was commissioned to model their portraits. These busts, after being sent four miles into the country to be fired, were delivered to the merchant in Sonneberg at 7d., and retailed in England as one-and-sixpenny articles. The practice is now common with the buyers for American houses to reserve their English orders until they have traversed the German pottery districts.

THE FAIRIES' GOD-DAUGHTER.

IN this country we have long been familiar with fairy mythology, and the traditions have often afforded subjects for artists. But no English painter has had the courage to produce a scene from fairyland like the one by M. MAZEROLLE, which, by the kind permission of the artist, and with the aid of a photograph by MM. GOUPIL & CIE., we illustrate this week. It is a veritable land of dreams, and could only have been depicted by a painter whose imagination was equal to the loftiest flights in art.

CONGREGATIONAL CHURCH, RICHMOND, YORKSHIRE.

THE new church shown in the illustration is to be built in Dundas Street, Richmond, on a site given by the Right Hon. the Earl of ZETLAND, who is the principal landowner in the neighbourhood. Accommodation is provided for 360 persons and a school for 120 children. The external walls will be faced with pitch-faced blockers in narrow courses, with stone dressings. The roofs will be covered with Westmoreland green slates. The architects are Messrs. CLARK & MOSCROP, Feethams, Darlington.

NO. 42 AND 43 FORE STREET.

THESE buildings, now in course of erection on the Blackden Estate, for Mr. EDWARD S. MARRIOTT, occupy the site of two shops of similar character to those on each side of the new building. The old houses, which were erected about the end of last century, were quite unsuited to modern requirements, and entirely devoid of architectural interest either on the exterior or interior.

The site appears to have been formerly the ditch immediately outside the City wall, but was built on about the beginning of the seventeenth century. According to the plan made by Sir CHRISTOPHER WREN immediately after the Great Fire, Fore Street was then completely built on each side, and escaped destruction by the intervention of the City wall, which was then nearly entire on this side of London. During the excavation for the basement the site was found to consist of made ground for a depth of about 12 feet below the present pavement level, but at 16 feet below pavement a solid bed of gravel was met with which afforded a good foundation. Nothing of interest was found whilst excavating, except a considerable quantity of bones.

These buildings, which occupy a site of about 1,360 feet superficial, will consist of a basement and five floors over, planned so as to be let off in separate floors for warehouse purposes, with a lift and goods entrance to be used by the tenants in common.

The front is being executed in gauged deep red brickwork, with red Corsehill stone bands, dressings, and cornices, the bases of the piers being red Aberdeen granite. LASCELLES' red cement concrete will be used for the enriched panels over first floor windows.

The red rubbers were supplied by Mr. LAWRENCE, of Bracknell; the whole of the ironwork by Messrs. M. SHAW & Co.; the lift and speaking-tubes by Messrs. R. WAYGOOD & Co. The asphalt floor covering to vaults and damp course are executed by CLARIDGE'S Asphalt Company, and the pavement lights by Messrs. HAYWARD.

Messrs. LARKE & SON, of Fore Street, are the general contractors, with Mr. ALLEN as foreman of works.

The whole is being carried out from the designs and under the superintendence of the joint architects, Mr. G. A. DUNNAGE and Messrs. HARVEY & PROTHEROE.

RING-O'-BELLS TAVERN, WEST KIRBY, CHESHIRE.

THE village of West Kirby is distant about eight miles from Birkenhead, and situate on the banks of the river Dee. Our illustration shows a group of buildings belonging to the Birkenhead Brewery Company, which stand at the entrance to the village from the hillside, and have recently been completed. Originally the wing on the left of the picture was simply a whitewashed cottage containing about six rooms, with a very narrow roadway leading past the door. A portion of the adjoining fields has now been thrown into the road to form an open space for driving up to the house. Advantage

has been taken of the quick slope in the site to gain an approach for a cart to the beer-cellars from Dungeon Lane at the basement level, whilst at the same level stabling for six horses is obtained under the club-room. An entrance to the hotel is also obtained from Dungeon Lane, thus entirely separating that portion of the premises from the bar and club-room. The house now contains three dining-rooms or sitting-rooms, smoke-room, bar, bar-parlour, club-room (30 feet by 18 feet), nine bedrooms, bath-room, water-closets, kitchens, scullery, larder and washhouse, with beer and wine cellars, and store-rooms.

The material used has been scutched-faced local red stone, lined inside with brick; slated roofs with red terra-cotta ridges. The floor of club-room over the stable is of Portland cement concrete on rolled iron joists. A difficulty presented itself in combining the old with the new work; but this has been accomplished by planting timber framing on the face of the old walls, and limewashing the stone faces both new and old. The exterior, therefore, presents the appearance of an entire structure in half-timbered work—"black and white"—and is well suited to the rural nature of the surroundings.

The total cost of the works, including asphaltting the roadway and stable-yard, was 1,300*l.*; the contract was carried out by Messrs. LEGGE & Co., of Birkenhead, from the designs and under the personal superintendence of Mr. ALEX. BLEAKLEY, A.R.I.B.A., of Birkenhead and London.

NEW PREMISES, DURHAM.

THESE premises have been erected at 3 Sadler Street, Durham, for Mr. JOHN SHIELDS, J.P. They have been designed with a view to occupation as a draper's and silk mercer's establishment. On the ground-floor is a shop 80 feet long by an average width of 20 feet; underneath this shop is a large furnishing-room, 48 feet by 17 feet, with access by staircase from shop above; and over the shop, approached by another staircase from same, is a large show-room, 37 feet by 20 feet, with large window (over shop window) the full width of frontage; behind show-room are two fitting-on rooms for the dressmaking and mantlemaking departments respectively, and a private office. The two floors above are both occupied by dressmakers' and mantlemakers' rooms and ware-rooms. The chief rooms are heated by means of hot-water pipes, the apparatus for same being placed in the front cellar. Sadler Street, though one of the main streets in the city, is only 21 feet in width. Schemes for the improvement of the town, by widening its narrowest and most frequented streets, have long been talked of; but, rather than give any compensation for setting these premises back, the Corporation have missed another opportunity for improving the city. The owner has, however, of his own accord, set the new building back about 1½ feet, thus giving this space to the town. Even so slight a departure from the old street line is at once seen to be a decided improvement. The total cost of these premises, including the taking down of the old buildings, amounts to about 2,400*l.* Mr. H. T. GRADON, of Durham, is the architect, from whose designs, and under whose supervision, the premises have been erected.

THE EXCAVATIONS AT HISSARLIK.

A LECTURE was delivered to the members of the Glasgow branch of the Educational Institute of Scotland on Saturday last, by Professor Jebb, the subject being "A Visit to the Troad." He said that his visit in last autumn was in company with Professor Goodwin, of Harvard University, director of the American School of Classical Studies at Athens, the principal object of their trip being to see Dr. Schliemann's excavations on the spot which that gentleman identified with the site of Homer's Troy. He spoke at some length of the scenery in the neighbourhood of the excavations, comparing it with Homer's references, and afterwards described minutely the remains found as the result of Dr. Schliemann's explorations. Was the pre-historic town discovered there, he asked, Homer's Troy? The town might be Troy. They could not possibly affirm it; neither could they deny it. No remains presumably so old had been found on the plain of Troad. But was the town discovered the very town Homer described? Could they expect to identify among ruins the places and the sites mentioned in the Iliad? Assuredly not. Homer's Troy was a city of wide streets and great marble palaces. The character of the remains found was altogether different. The town might have been the historical prototype of Troy, but it could not have been the immediate original itself.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE seventh ordinary meeting of the Royal Institute of Architects was held on Monday evening, Mr. David Brandon, Vice-President, in the chair.

Mr. R. HERBERT CARPENTER read a paper, of which the following is an abstract, under the title of

A Comparison between the Mosque-Cathedral of Cordova and some other Contemporary Arabic Buildings.

Mr. CARPENTER said that, having been honoured by a request from the Council, he proposed in his paper, which was illustrated by architectural plans and sketches, to which constant reference was made, to lay before the Institute some information as to the great Mosque-Cathedral of Cordova, and also some remarks upon Seville Cathedral, both buildings having been left undescribed by Mr. Street in his admirable work on Spain. The communication was the result of a recent visit by Mr. Carpenter to the south of Spain and a part of the north coast of Africa. The author complained of the unreliability of the guide-books, even good ones, such as O'Shea's and Murray's, on the subjects in which he had interested himself, conveying as they did altogether dubious impressions. He would therefore refer to the Mosques at Mecca, Jerusalem, Damascus, and Cairo, with which these authorities compared that at Cordova, and then to the more primitive type, from which, in his own opinion, its plan was really derived, namely that of Kairwân in the newly-annexed French province of Tunis. He accordingly began with that of Mecca, most graphically recapitulating the current Moslem traditions, relative to that mother Mosque of the Mahomedan world.

According to their mythology, no building in the world was more ancient than that of Mecca. Tradition said there was a Kaaba in heaven, and that Adam, the first believer, erected the first Kaaba on earth, to guard which 10,000 angels were appointed, and who, at the time of the Deluge, raised it in the air and preserved it. The famous black angle-stone was given by the archangel Gabriel; it was white then, but had become black through the sins of men. The Kaaba was, but a small square building in the middle of Mecca, with cloisters built round about it. Passing thence to Damascus, history taught us that it was the first great city conquered by the Arab invaders, into whose hands it fell about A.D. 634, followed by Jerusalem a very few years later, and by the North African conquests in A.D. 711. The Mosque at Damascus was a curious combination of Romano-Christian and Arabic work, and it had never yet been described in such detail as it merited, partly through the peculiar intolerance of its inhabitants. Mr. Hayter Lewis, however, had carefully examined and noted some of its features, and these were briefly alluded to. Originally a great Roman temple stood on the site. In what way this was converted into the Basilica of St. John the Baptist had not yet been clearly made out; but the massive sub-structure of the western minaret went back to that date, possibly the beginning of the fifth century, or even earlier, and this portion of the Mosque might have formed the campanile of the church. At first, after the Arab conquest, the Christian building was divided between Christians and Moslems; but eventually the Caliph Walid required the whole, and rebuilt it, using the older columns and capitals and other materials of both ancient buildings. The new erection was then described. The Al Aksa Mosque at Jerusalem was next spoken of, which stood on the site of the church built by Justinian in honour of the Virgin, as the author thought, although he candidly owned that Mr. Fergusson places Justinian's church on another site. A description was given, illustrated by a plan enlarged from the survey of Major Warren. On one occasion, when rebuilt, the length of the building had been diminished and the breadth increased, and it had again been wholly remodelled by Saladin after it had been used by the Crusaders. The general style of the building was pointed; the arches were tied together at the springing with beams of wood cased over.

The author next considered the great Mosque at Kairwân, which up to the late annexation of Tunis by France was quite as sacred from profanation by the infidels as Mecca itself still is; so much so, indeed, that when Mr. Rae visited it he was quite unable to do more than glance through the doorways into its interior, and when taking some few notes of the exterior was glad to place himself under the protection of a guard of soldiers granted by the Kaid. Notwithstanding all these difficulties he got at the main features of the Mosque with wonderful correctness, as was proved by Mr. Broadley's "Tunis Past and Present," whose plan, through the kindness of that gentleman's father, Canon Broadley, Mr. Carpenter was allowed to reproduce on the same scale as was adopted in his own plans of the Cordova Mosque, and of those of Al Aksa and Damascus. The growth of the Kairwân Mosque was then described from its small beginnings, when it was founded by the Emir Okhbah in A.D. 667. The author's account of the prototype prefaced his description of the grand Mosque-Cathedral of Cordova, famous both for its very considerable architectural and artistic merits, and also as being the only survival in Europe of the primitive style of the Moslem places of worship. As already mentioned, the great Moorish invasion of Spain took

place in A.D. 711, supplanting the old Gothic kingdom, after its having lasted two centuries and a half. In that year Tarik, the Moorish conqueror, captured Cordova, and converted into a Mosque a large part of the church of San Vicente, which stood upon the site of a former temple of Janus, leaving the rest, with their usual generosity, to the Christians, who, however, were afterwards bought out at a cost of 44,000*l.*, an enormous sum in those days, by the Caliph Abd-el-Rahman in A.D. 786, who was said to have saved the money afterwards by making the Castilian slaves work for him. Abd-el-Rahman did not live to see the finish of the work, which was carried to completion by his son, exceeding in grandeur any Mosque at Damascus, Jerusalem, or Mecca. In the course of the next two centuries the vast increase of population necessitated enlargement, more space for worship being required. Arches were pierced through the southern wall, and the eleven aisles of the building were carried on two bays further south. Later on it was further enlarged by cutting arches through the whole length of the western wall, the sharp fall of ground towards the river preventing any extension in that direction. Eight aisles, thirty-six bays in length, were added, and the east court was continued eastward. This court contained the marble ablution cistern, supplied with water direct from the mountains. Important changes took place in the building subsequently to the period when the Moors became vassals of Spain. The practice of using old marble pillars from the locality, and the use of the round arch, was followed. Some of the columns came from Seville, Tarragona, Carthage, and even from Constantinople, many of them of the choicest marble, but all of varying diameters. With regard to colour a purely haphazard arrangement prevailed, but owing to the beauty of the material the effect was very gorgeous. In the course of his elaborate description of the building, Mr. Carpenter referred to the uncertainty as to the number of doorways, though it was evident there were many opening on the east and west sides. They had arches over them of brick and stone, and marble spandrels richly carved. At the south-east end was a door reached originally by a covered way from the Caliph's palace. This and other doors were covered with Andalusian brass, and at the entrance to the court one of these doors still existed. There was a pulpit constructed of ivory, wood, and precious stones, said to have cost a fabulous sum of money. The recess in which the sacred Koran was kept was alluded to as richly ornamented with Byzantine mosaics, other parts of the building being also ornamented with this beautiful mosaic. Mr. Carpenter remarked that those who had barbarously white-washed the interior had much to answer for, and he spoke in terms of praise of the care shown for the building by the late Bishop of Cordova, whose example was followed by the present bishop; from it he anticipated good results. The architectural details of this building formed the staple of the paper.

Mr. Carpenter then proceeded to compare, one with another, the various buildings reviewed, and said it was clear that the Mosque at Mecca formed no guide for any of the rest either in form or style. The conditions under which it was built were quite peculiar. It was the centre of worship for the Moslem world. The Kaaba and its surroundings marked the place for the Faithful, who were at first simply walled in, and were afterwards shut in by covered cloisters, the dimensions of which were again and again enlarged. But at all other cities of the Moslems the Kibleh, or direction of the Kaaba, was the all-important condition to be observed in building a new Mosque or in altering an old one. The Kibleh once fixed, what was left was the provision of proper shelter from the sun for the worshippers. When the Arabs established themselves on a new site, the simplest plan they could follow, after fixing the Kibleh, was to build sheds or aisles side by side, surrounded by walls, adding an open walled court for purposes of ablution. At other places some existing building could be made available. But since a church or basilica ran east and west, whilst the Kibleh of a mosque required, when it was north of Mecca, to be south, and in the southern parts of Europe must necessarily be east or south-east, it was only in some places that the basilicas could be altered or adapted to Moslem wants. In other places the basilicas had to be swept away, since the difference in angle between east and south-east made it impossible to make use of them. An exception was made at Constantinople, where the glorious Church of St. Sophia was spared, and the now existing compromise arranged. At Jerusalem and Damascus the south aisle wall of the respective basilicas very conveniently became the Kibleh wall of the Mosque, with more or less adaptation of the building in other respects. At Kairwân there was no already existing building to adapt, and Okhbah fixed the Kibleh by supernatural help, and built his aisles side by side. The men of Kairwân, having become the conquerors of Spain, found a church already existing at Cordova, but they had to clear it away, as its south wall did not tally with their south-east Kibleh. They accordingly followed their own indigenous type, and kept to it throughout all their rebuilding. And when people, originally from the same Kairwân, under their General Gouher took Fostat, or Old Cairo, in A.D. 973, and founded El Kahîrah, the Cairo of the present day, the Mosque of Azhar was founded and completed by that soldier in A.D. 981, on the same general type of the great Mosque of Kairwân. In after centuries it was rebuilt, but the proportion of its original plan was preserved. Thus the Arab his-

torian Makrizi, who wrote in the latter half of the fourteenth century, related that a great earthquake happened in A.D. 1303, which laid the whole in ruins, so that it had to be entirely rebuilt. Of other Cairene Mosques the older one at Touloun, founded A.D. 679, was more like that of Damascus, and its aisles ran across it instead of in the Kibleh direction. The Mosque of Hakem resembled that of the Touloun, but the Mosque of Amrou, when rebuilt (as it is now), followed the Kairwân type. Hence the author thought the Mosque of Kairwân most valuable historically, as being the model of buildings in countries so widely apart as Egypt and Spain. The remainder of the paper was devoted to an account of Seville Cathedral, and its relation to the Moorish epoch of Spanish history.

Seville Cathedral, contrary to that of Cordova, contained little of Moorish but much of Christian art. The original and primitive Mosque, burnt down in 1184, was rebuilt. Some small portions of it still remained, as well as the court on the northern side of the cathedral. In 1248 Seville was captured by King Ferdinand, and the Mosque, was then converted into a Christian church, the Moors, however, being allowed to retain a small part; afterwards it became ruinous and was pulled down. The Chapter having met, passed a resolution to build a church so large and so beautiful that coming generations might think they were mad for attempting so large a building. In the author's opinion it was one of the grandest buildings ever erected. On reference to the plan, he said it would be seen that the site of the Mosque adapted itself beautifully for the cathedral, orientation not being considered necessary. The original Moorish ablution fountain was still preserved. Passing through the gateway, a grove of orange-trees was entered, over which rose the beautiful tower. This great tower was built of brick, and was used as a minaret for calling the Faithful to prayer. The present top storey of the belfry replaced an older one, and was most successfully adapted to the old work. The apex of the tower was formed of a female figure representing Faith, and turned as a weather-cock; hence the name Giralda. The original east end was square, a form found also at Salamanca. Internally the central aisle was 56 feet wide, and the side aisles 40 feet wide; the height of nave 134 feet, and the dome 148 feet over the crossing. The vaulting of the four aisles was all on the same level; that of the nave rose higher, sufficiently high to contain a small clerestory. Among the striking characteristics of the cathedral were its proportions, purity of detail, suitability to the climate, and the perfect mastership it showed of Gothic art. Its external arrangements called for no special remark, the effect being spoiled by later additions.

Mr. PERCIVAL said he had lately visited Kairwân, and he believed Mr. Broadley was the only other Englishman who had been there before. It must be remembered that up to the time of the French occupation of Tunis, Kairwân was entirely isolated from the outer world. The Jewish traders had to stop two miles outside the city, and even the few Christians who entered, with permission of the Bey, had to walk through the streets with an escort, and, as he imagined, saw little or nothing. As regarded the interest attaching to the Kairwân from its antiquity, there was no doubt Mr. Carpenter had proved his case. It was a typical Mosque, and one of the oldest, if not the very oldest. That the Mosque at Cordova was based on the same design as that at Kairwân, Mr. Carpenter had likewise proved. There was another point of interest attaching to the building: that it was originally intended for a Mosque, and had not been converted, like St. Sophia at Constantinople, from an ancient basilica. He once had the privilege of being present at a grand service at St. Sophia at the fast of Ramadhan. He was in one of the upper galleries: the whole building was brilliantly illuminated; all the domes were filled with light—one blaze of glory. But the whole effect was spoiled when one looked down. The worshippers stood in lines along the building with about a yard between them; but the lines were all crooked, and, instead of looking towards the old altar, they looked towards Mecca, and the effect was spoiled. In the same way the nave was all covered with splendid carpets, and these were crooked also. But at Kairwân the building was originally intended for a Mosque, and the whole of the building was in keeping with the original plan. As to the interior and the beauty of its columns, it was impossible to speak. The magnificent series of columns were of every kind of marble, granite, and porphyry. At first, on entering, the effect was disappointing; coming out of the brilliant sunshine one appeared to be in a large gloomy chamber. But they maintained a due gravity, and gradually persuaded their conductor to throw open one after another the seventeen doors of the Mosque, when a flood of sunshine came in, and the effect was magnificent. Whence came these wonderful columns? Some from foreign parts, no doubt; but anyone who knew Tunis must know there could be no difficulty for want of marble there. On the site of Thesbis they themselves had picked up fifteen kinds of marble. There was also there the third largest theatre in the world, and which seemed to be little known. He mentioned it that anyone who went to Algeria might be tempted to go on to Tunis also. Kairwân and the great amphitheatre would quite repay making the expedition into the interior.

Mr. WYATT PAPWORTH proposed a vote of thanks to Mr. Carpenter for his paper. Having asked how the points of the

compass—as a guide to orientation, or in the case of Moslem buildings, the Kibleh—were to be interpreted on the plans shown by Mr. Carpenter, Mr. Papworth expressed a hope that the Council would see their way to publishing all the plans in the Transactions.

Mr. R. PHENE SPIERS seconded the vote of thanks, and said that his observations of the Mosques at Cairo, Damascus, &c., pointed to Mr. Carpenter being right in the conclusion he had drawn, that the Mosque at Kairwân had served as a type for that at Cordova and the generality of Mosques.

The CHAIRMAN said he had not had the advantage of seeing the Mosques described, and so could not say anything on them without further consideration. They would all agree, however, that Mr. Carpenter had taken great pains, and had read the paper with great interest. It was a paper which required to be read and considered more particularly and privately than could be done in the present circumstances. It was a good idea, and one he had thought of suggesting, that some of the plans and a few of the views which they saw hanging around them should be published with the Transactions. The Chairman then put the vote to the meeting, which, having been passed,

Mr. CARPENTER briefly replied, and the proceedings terminated.

THE CHANNEL TUNNEL.

A LECTURE was delivered on Saturday by Sir F. J. Bramwell, F.R.S., M.I.C.E., to the members of the Leeds Philosophical and Literary Society on the Channel Tunnel. He began by pointing out that our Continental neighbours, having borrowed the gauge of our railways, if a line of railway were laid between Dover and Calais a train might travel from the north of Scotland through France, Italy, and Germany without any break of gauge or transhipment of passengers. The first division of his subject was the making of the Channel Tunnel. There were two principal kinds of soil through which a tunnel could be made. One was so loose that it would not stand for a minute without being timbered, though it was easily excavated. The other kind was so hard that it required blasting. There was a notorious exception—the Thames (Brunel's) tunnel—which was made practically through a liquid material. If engineers could choose their own soil for tunnelling, it would not be the loose soil which required so much timbering, nor the clay, nor the rock, but one easily cut, and which when cut would stand alone. If such soil when cut proved impenetrable by water it would be perfection. On the whole of the English Channel the Straits of Dover was clearly the best point at which to make a tunnel, not only because it was the narrowest point, but because it was that where crossing hitherto had been general, and where the roads and railways on both sides converged. Then came the question, Was it at this narrow point that the desirable stratification was to be found? Fortunately they found the very formation of all others which was desired. The chalk cliffs on both sides of the Channel were identical, and the highest authorities, the geologists, said that, looking at what was found on the two sides and in the bed of the Channel, there was reason to believe that the chalk existed all the way across the Channel. In the construction of this tunnel every circumstance pointed to the use of machinery. This must, however, be worked at a distance from the original source of power. There were many means of doing that. Several of these he described. He would advise them, however, to use the system of compressed air, by the use of which they would drive the engines, as though they were employing steam, at any pressure from 1,000 lbs. to a square inch downwards. These compressed air engines did not vitiate the atmosphere as did other motors, but on the contrary, they carried into the face of the working a supply of pure air. The chalk appeared to be capable of standing for any length of time, and would allow of the lining being put in with great deliberation, though, indeed, the chalk upheld itself so well that it was doubtful whether there need be any lining at all. The lecturer then described the means by which it is proposed to remove the loose material. He also pointed out the means by which engineers could surmount possible, though improbable, difficulties arising from fissures in the chalk. If these fissures could not be filled up by a ship-load of Portland cement—thus creating an artificial rock through which they might bore—they might construct a wrought-iron tube wide enough to bridge the fissure, and watertight. Coming to the working of the tunnel, he said the question of ventilation here again demanded their attention. It might not be of much importance if engineers only entered the tunnel, but the ordinary passenger wrote to the *Times*. He complained—he must have fresh air. Under these circumstances he thought it probable that the ordinary locomotive would not be retained, although the temptation was very great. Including the ordinary locomotive there were seven modes by which the trains might be propelled. Enumerating these, the lecturer remarked of electricity that he would be a bold man who could deny that in two or three years this power would be of immense importance as a propelling agent for trains. The pneumatic system was an exceedingly efficient one where there were many trains travelling at short intervals, but he did not think it would be an economical system for a tunnel twenty-five

miles long. He therefore once more proposed to use the compressed air locomotive, which had everything in its favour. Coming to the objections which were urged against the construction of the tunnel, he argued that if it was worth while to spend a million and a half or two millions sterling in order to connect the intelligent but scanty population of the north of Scotland with England, it was scarcely reasonable to underrate a project which would establish a railway connection between England and the whole continent of Europe. Passing away from the points of the need and of the paying or non-paying of a dividend to shareholders—about which he believed there was very little conflict of opinion—he would come to the question of the safety of the country as affected by the tunnel. One must agree that some military and naval men of the highest position—the Duke of Cambridge, Lord Wolseley, and Admiral Sir A. Cooper Key—had strongly disapproved of the project; but there was no particular reason to regard them as infallible. Lieut.-General Sir John Adye and Sir Andrew Clarke took a totally different view. It was as a rule not wise to intrust the decision of any question involving complex considerations to specialists. Last autumn he had to put up with a good deal of good-humoured chaff while travelling in the United States on the subject of the Channel Tunnel scare, and was frequently asked whether the men of England had really grown timid lest, through the making of a couple of ratholes, they would be murdered in their beds. He proceeded to show how, from the engineer's point of view, it would be possible to render the tunnel useless to an invading enemy.

PICTURE DEALING.

THE late Mr. Nieuwenhuys, who died at his residence, Wimbledon, on the last day of January, at the advanced age of eighty-four, was, says the *Times*, well known to all the principal amateurs and collectors of pictures by the Old Masters. During his long and active life he had brought many important examples of the Dutch and Flemish painters to this country, which have enriched some of the best collections, among them being several for the Peel collection, since added to the National Gallery. He was entrusted with the formation of the gallery of the King of Holland, of which he wrote the valuable *catalogue raisonnée* published in 1843. Before this he had distinguished himself as an art critic, as early as 1834, by his review of the lives and works of some of the most eminent painters, with remarks on the opinions and statements of former writers—a work written in English, of which language he had made himself master, and thus qualified himself for the profession of an expert and dealer in London with that success which led him to make it his home, and gained for him the reputation of being a profound practical judge of pictures and an honourable man of business. Though Mr. Nieuwenhuys came after those famous days of picture sales at the end of the last century, when the Orleans collection was finally dispersed in London under the hammer, and when M. Desenfans and M. de Calonne sent their treasures into the market, yet he was contemporary with Mr. Buchanan, the author of the interesting memoirs of painting, and with Mr. Bryan, who acted for the Duke of Bridgewater and the Marquis of Stafford in their great purchase of the Orleans pictures, as well as with M. Delessert and M. de la Hante, the most eminent French dealers of their day. It was indeed to De la Hante that he sold the beautiful little *Vierge de la Maison d'Orleans*, which he (Nieuwenhuys) had bought at the auction of Mr. Hibbert's pictures at Christie's, in 1829, for 200 guineas, and after selling it to the Hon. G. Vernon, again became the purchaser of it in that gentleman's sale, in 1831, for 290 guineas. These were very low prices for a Raphael, and eventually the Duc d'Aumale had to pay at auction 150,000 fr. in 1869 to recover the long-lost gem of his family collection, which had twice passed through the hands of Mr. Nieuwenhuys. The vicissitudes of this little panel, only 18½ inches by 11½ inches, which will be remembered in the exhibition at Burlington House in the winter of 1872, are remarkable. It belonged to the famous Crozat in 1763, then to the Abbé de Camps, of whom the Duc Philippe d'Orleans bought it, only, however, to sell, with all his Italian and French pictures, to a Brussels banker, M. Walkuers, for 750,000 livres, in 1790. Then it passed to Mr. G. Hibbert for 500 guineas, and came up at Christie's, as we have seen. Soon after it was seen by Rossini, the great composer, who took such a fancy to it that he bought it, and had it for some years, parting with it at length to M. Aguado, and in the end it came up for sale in M. Delessert's collection at the Hôtel Drouot, to be recovered by the Duc d'Aumale. But perhaps one of the most notable of these curious chances and changes, which attend old pictures was in Mr. Nieuwenhuys obtaining from the Chapter of the Church of St. Bavon, at Ghent, the four lower wings of the celebrated altar-piece by Van Eyck, which are now among the rarest pieces of the Berlin Museum, their places being supplied by the copies which were made by Michail Coxie for Philip II. of Spain, who specially admired the work. These copies, by a most singular good chance, afterwards came into possession of Mr. Nieuwenhuys about the year 1850, and were naturally offered to the authorities of St. Bavon, at Ghent, and, of course, accepted, to be placed where they have been seen for the last thirty years, in

some sort of satisfaction for the loss of the originals, parted with in an evil hour, and it is said when the Bishop was absent. Mr. Nieuwenhuys had to stand an action at law for the recovery of the pictures thus sold to him, but the purchase was confirmed by law, while, fortunately, some compensation was eventually made in the discovery of the fine copies procured, strangely enough, by Mr. Nieuwenhuys himself, who was, no doubt, glad to have the opportunity of making the *amende* for his too favourable bargain. The price he paid is said to have been only 6,000 fr. They were afterwards sold, it is stated, by Messrs. Crowe & Cavalcaselle to Mr. Solly for 4,000l.; and by him for something more, it may be presumed, to the then King of Prussia, who, however, is known to have purchased the chief part of the Solly collection for 500,000l. M. Passavant states that Mr. Nieuwenhuys sold the wings, with some other pictures, for 100,000 fr. to Mr. Solly; so that this serious discrepancy exists, and probably there is an error in making 400l. into 4,000l., which could be cleared up by reference to Mr. Nieuwenhuys's papers. What has become of the other parts of the copy made by Coxie is not apparently yet known; so that, if any reference to them should be found among the papers of Mr. Nieuwenhuys, it would be of very great interest. Another copy (on canvas) was once in the Hôtel de Ville, Ghent, which was sold by the French, and was afterwards, in 1819, in the collection of Mr. Aders, and is said to be still in England. Possibly Mr. Nieuwenhuys may have left some traces of the source whence he obtained the four wing pieces, which might lead to the discovery of the remaining parts of the copy of the great altar-piece of the Adoration of the Lamb. No such pictures are to be found now in the Madrid collection, if they ever reached their destination.

THE ARCHITECTURAL ASSOCIATION.

THE seventh ordinary meeting of the Association was held on Friday evening, Mr. E. G. Hayes, President, in the chair. The following gentlemen were elected members:—Messrs. W. L. Buxton, A. H. Osmond, J. Upton, A. H. Heron, A. Miles, C. W. Piper, F. S. Ogilvie, E. Greenop, H. D. Walton, J. Lord, jun., H. Evans, A. E. Mullins, and F. Swinburne. Mr. E. J. Tarver, past President, and Mr. Crossland, member of the Institute of Architects, were elected members of the Association by acclamation.

A vote of thanks was passed to Mr. Gribble in connection with the late visit.

Mr. W. H. ATKIN BERRY, Hon. Secretary, said that the visit for February 24 (to-day) was not then settled, but he hoped it would be fixed in time to give notice in the professional journals.

Mr. A. J. GALE then read a paper entitled

Some Notes on Professional Practice.

Mr. GALE said he did not propose to go deeply into details of the various departments of modern practice, but to review some of the influences that bore on modern practice, and the relations of the architect to his work and to his employer. The profession had its recruits from all grades in life, and all degrees of education, who required in many cases a considerable training. Having referred to educational matters and numerous means of training of a more special kind open to a student nowadays, he remarked that no one could hope to claim the highest position in his profession as a practising architect, who was not, at the same time that he was a true artist, a thoroughly practical man, and he believed that the standing of architects had been much damaged in the eyes of the public because, for matters constructive, many relied almost entirely on the practical knowledge of the quantity surveyor, whose special department this was often supposed to be. It hardly came, Mr. Gale said, within the scope of his paper to suggest improvements upon the average curriculum of studies he had outlined, but he might add that a special course of study in advanced drawing from the antique, &c., a few months spent in the workshops of a high-class building firm, or, better still, a year in the position of clerk of works would be most useful. But supposing the student to be the possessor of a store of knowledge, to have completed his articles, and perhaps to have served a year or two as a junior in a good office, practice being, say, out of the question—for the public were slow to trust young men—the young architect looked about him; and after perhaps some difficulty, less or greater, as he was more or less experienced, obtained an appointment as managing assistant to an architect in good general practice. Here his real troubles began, and his thoroughness or carelessness in the past would be felt. He was brought face to face with difficulties of all kinds—questions constructive, to be settled in the preparation of working drawings; arranging matters so as to carry on the work of the office smoothly; interviews with builders and clients; superintendence of work; settlement of accounts; instruction of the pupils and the various other duties of his position. All this was training of the best kind, and the person who successfully managed another man's office was most likely to do the same with his own when he had one. Mr. Gale then passed on to the time when work offered itself to the aspirant who was in a position to start for himself, having passed the new examinations and joined the Institute of Architects. He perhaps had not sufficient work to keep the whole of his time profitably

employed. In this case it was a very usual proceeding, and one which both principal and assistant found convenient, to arrange half one's time for private work, and half for work at the principal's office. After referring to the competition question, Mr. Gale described in detail how the young architect would deal with his first building of any magnitude, and in the course of his description, said it seemed a pity that the specification should be left entirely to the quantity surveyor, as it often was, for the architect himself must best know what he meant the work to appear and to be, in each particular case. He did not consider it any answer to the question to say that the quantity surveyor was the more practical man of the two. As far as his experience went, he found no reason to believe it improper or inadvisable that the quantities should be taken out by the architect for his own works, or at least under his eye in his own office. It insured careful and reiterated attention to the details; difficulties were met by a full, first hand knowledge of all the circumstances of the case, and he did not think there was much advantage, as had been maintained, in the submission of the plans to a second critical judgment. The quantities must, if taken out by the architect, certainly be paid for directly by the client, and the whole be done with his knowledge and consent. Mr. Gale described the various proceedings from the time of the commission for the work being received to the finish, planning, obtaining tenders, selection of builders, &c., being in turn treated of. The selection of a clerk of works, he remarked, was a matter of some difficulty, as he might turn out unreliable in many ways. He might drink, or connive at builders' dishonesty; or, if honest and sober, he might be incompetent to perform his duties. An energetic architect's assistant—junior, pupil even, or otherwise—might make a good clerk of works, especially if he had tact and business capacity. The clerk of works should be constantly on the works and not be kept too much in his office making drawings, or sent away on errands of various kinds, if it could be helped. There were quite enough things for him to do, if he properly attended to his duties, without having the care of matters which were better done in the architect's office. Some details there were which the clerk of works alone could fully appreciate the need of, and these he would best make on the spot, but they were more in the nature of explanatory diagrams than detail. Again, by careful periodical supervision, without however undue interference, the success of a good average clerk of works was often largely affected. It should be ascertained by the architect that his records of extra work and variations were kept duly posted up, and that he had them ready in such a form that they might be really useful in settling up accounts. His method of dealing with the builders' representatives should be noticed, and any points in which he could beneficially alter his manner should be mentioned to him. Too much zeal was as bad as too little, and it frequently happened that a foreman and his employers were driven to the verge of desperation by perpetual and often well-intentioned interference. A mistake, or scamping of work, should be checked at once, and not allowed to cost the builder unnecessary labour after discovery. When it was considered how many and how complicated arrangements were required to carry out a building, it must be admitted that an honest builder should be treated with all the consideration that could fairly be shown to him. In the majority of cases an architectural student approached the position of clerk of works admittedly very unprepared, and in the nature of things it must be so. His knowledge had been till then largely gained from office work. Still, he had no cause to fear. He had, it was true, new responsibility, but he would soon find his footing.

Mr. Gale then alluded to architects in regard to their appearances in public as witnesses in legal cases, and as architects to public bodies, &c., in all which cases he should be able to prove his aptitude for speaking and thinking quickly and well, under the critical notice of his fellow-men. Besides, it often fell to an architect's lot to address public meetings at laying foundation-stones, opening ceremonies, &c., and it often happened that a man who was successful at technicalities failed when required to deliver an address of an impromptu nature to a general audience. Sanitation and drainage matters, heating and ventilation, were then dealt with, in the course of which the speaker called attention to the remarks of Mr. Ewan Christian, delivered at a former meeting of the Association. The speaker next entered on the question of dilapidations, damages by fire in connection with insurance companies, the development of building estates, and Government work as regarded acting professionally for Government. The problem as to the ownership of drawings was also noticed, and this was followed by a consideration of architects' charges. Specialism and valuations next claimed attention, after which some special remarks were devoted to designing, in which allusion was made to the use of books in designing. Sheer copying, Mr. Gale said, was to be condemned; but the knowledge of where to go for hints on detail and construction was most valuable. Indeed, it had been said that, in these days of many books and many subjects, knowledge was in many cases the faculty of knowing where to lay your hand on the information you required. This was true as a rule, more particularly as to questions of plan and construction. Mr. Gale then concluded with observations on the relations between architects and lawyers, questions of light and air, easements, arbitrations, &c.

The PRESIDENT said they were under a twofold obligation to Mr. Gale. In the first place, he had come forward to fill an unexpected vacancy that evening, and, in the second place, they were indebted to him for a very comprehensive paper, and one which had touched on all the subjects they were likely to meet with in the course of their professional career. Competency in many of the matters treated of could only be acquired in actual practice of that career. Still, to be forewarned was to be forearmed, and thus they would be the better able to grapple with the subjects when brought face to face with them. With regard to the employment of pupils as clerks of works, he thought it should be deferred till they were out of their time. The position was one of responsibility, and required an accurate knowledge which the pupil could hardly be expected to have attained. In concluding, the President asked Professor Kerr to favour them with some remarks.

Professor KERR testified to the pleasure he felt in attending meetings of the Association and contributing what he could to its welfare. He had listened with very great satisfaction indeed to the paper which had been read. The range of subjects touched on was very large, and though it was impossible to treat them all with minuteness, yet Mr. Gale had most successfully suggested to students and beginners in the Association the main questions which required attention and somewhat anxious consideration in ordinary life. The point the Chairman had mentioned in regard to the employment of pupils as clerks of works was an important one, and one well worthy of consideration on both sides. In these days, when the architectural profession was extending itself in point of numbers so largely, and the amount of work to be done was not extending itself in like proportion, he held it was the duty of all who wished well to the profession to encourage pupils to direct their attention to all kinds of architectural details. He was happy to see in many ways that architects were pushing their way, or being pushed, into fields of exertion which were formerly closed against them. As regarded undertaking the duties of clerks of works, nothing could be more valuable, educationally, to young men than the exercise of these duties. At the same time he must be competent to exercise them, or it would be wrong to place him in such a position. The clerk of works had to interpret the drawings of the architect, which builders and builders' foremen could not as a rule so well do. He had to watch the client's interest in several matters which were not easily determined, such as the quality of materials, performance of work, the avoidance of pretended extras; and young men were not able to tackle all that. But a young man who had passed through his apprenticeship could not do better than pass some time as a clerk of works. Architects were not sufficiently alive to sending out their pupils to inspect their works. It was not from selfishness, but because masters were too much occupied to think of these particular questions; but a young man who was learning architecture as a business ought to be sent out to see how buildings were executed, and ought to be permitted to pick up what he could out of the office as well as in the office. But it was quite true that young men did not always take advantage of such opportunities when offered; they liked to pass their time in the more amusing occupation of making drawings in the office; but he would put the matter in this way, that young men should have more opportunities of seeing out-of-door work. Speaking of the relation of architects towards lawyers, Professor Kerr said it unfortunately happened in this country at the present moment that lawyers were increasing in numbers in a most marvellous way, and, inasmuch as they would live or starve, it followed that disputes were increasing, and no dispute could nowadays arise without being converted into a bitter quarrel. Speaking with all respect of lawyers, he must say the system of litigation under which they groaned was very grievous. There was something in bricks and mortar that lawyers could not understand. A solicitor might occasionally have the means of arriving at some knowledge of what it was all about; but as for the barrister, and he often told them so, he had not the faintest glimmer of knowledge in the matter. They dealt with abstractions; but there were no abstractions in building matters. All building disputes ought, he thought, to be settled by architects, and by architects alone. He had never known a question of building settled in a court of law, except upon a false issue. The object of the lawyers was to mystify the judge, and the business of the judge was to find his way out of the mystification. Of course he did not do it. They never believed what the profession said, and so they could not and did not understand the case. One counsel persistently raised one falsehood, and the other raised persistently another falsehood; the judge raised a third, and on that settled the case in dispute. With architects the process would be somewhat irksome and tedious and somewhat expensive, but expenses would not be run up were it not for lawyers. An arbitrator always did his best to get rid of the lawyers in the first place, and then he heard patiently each side in order to save time, and he gave his decision on practical grounds. Professor Kerr then showed by a little agreement on the part of litigants they might arrive at a result fair to each. Truth, he remarked, always lay between two extremes, and it did not take much to see that it lay very nearly in the middle. The question of how to settle building disputes without litigation ought to be taken up by the Institute upstairs; but if the Association would take up the ques-

tion in a primitive way they would be doing a service, and it would eventually be brought before the higher tribunal upstairs.

Mr. J. SMITH proposed a vote of thanks to Mr. Gale for his paper. In the course of his remarks he said he was afraid to think of the consequences, if pupils were placed in the position of clerks of works, an arrangement which independently would hardly satisfy the client. It was bad enough when, for the first time, undertaken by a person considered duly qualified for the position. Pupils should certainly be sent out on to works in progress, a system which was not carried out in London as it might be. It seemed to him that an architect ought to take the pupils under him on to his works. He thought too much was made out of the question of sanitary matters, as if there were some serious difficulty in such matters; clients of course inferred from this that architects knew nothing about sanitary arrangements, and perhaps with justice. The fact was that sanitarians knew something about them, but he would be very sorry to hand over to these specialists the sanitary arrangements of any building, except under the guidance and with the help of an architect. It was difficult to understand how it was so much nonsense was talked about sanitation. The matter was simple enough in itself, the chief point being to carry it out with the utmost simplicity possible. The basis of the whole thing was to have exact and correct principles carried out properly.

Mr. S. F. CLARKSON seconded the vote of thanks, and spoke in complimentary terms of the paper which had been read.

Mr. F. FARROW said that a sore subject had been alluded to, and it was the question of the ownership of drawings. In law, no doubt, the ownership rested with the client, but in equity it rested with the author, and if they used a little strategy they might carry out equity instead of law. If they put it before a client that they were willing to carry out the work on the usual conditions of 5 per cent., and retain the drawings, but if he retained them they would want another 5 per cent., the client would be quite willing to accede to the proposition. And to avoid any unpleasantness they might give the client a plan of the house, showing the water and gas service and the drainage system. Few clients would then be so hard on them as to exercise their strict legal rights; in this way the difficulty might be got over.

The PRESIDENT then put the vote to the meeting.

Mr. GALE in replying pointed out that in speaking of the employment of pupils as clerks of works, he implied that due discretion must be used in the matter. Many pupils were decidedly able to assist an architect in the carrying out of works to a considerable extent, and if they did make some mistakes, clerks of works were not always what they should be, nor as reliable and efficient as they should be, and he thought there were occasionally cases where pupils could, with great service, be employed as clerks of works. In the present day they could hardly feel that the word architect covered the whole of the work they as architects felt themselves qualified to undertake. He believed that the term architectural surveyor was the true term to describe their status, and he was certain that they were fully qualified to carry out both branches of the profession if necessary—that was to say, if there were two branches. As to the suggested plan for retaining the ownership of drawings, it was just possible that it would not be practicable, as the client might go elsewhere, and in these days of competition of all sorts, one could perhaps hardly afford to lose a client.

WESTMINSTER ABBEY.

THE following memorial has been forwarded by the Duke of Westminster to the Home Secretary on the subject of the injury done to public buildings in Westminster by the excessive emission of smoke, especially to Westminster Abbey and the Houses of Parliament, urging a stricter enforcement of the provisions of the existing law, which are believed to be adequate for the suppression of much of the existing nuisance from the potteries. The memorial was adopted at a meeting of the Council of the Smoke Abatement Institute on the motion of Mr. Ernest Hart, seconded by Lord Algernon Percy, M.P.:—"Memorial to the Right Hon. the Secretary of State for the Home Department.—Sir,—The undersigned memorialists, members of the Council of the Smoke Abatement Institution, and others, are desirous of respectfully calling your attention to the evils attending the excessive emission of smoke and other noxious vapours from furnaces connected with factories and workshops in the metropolis, and especially those connected with various potteries in the district of Lambeth. Notwithstanding the serious injury to the Houses of Parliament, Westminster Abbey, and other buildings which must arise from this cause, and of which recent evidence has been adduced, your memorialists have seen with regret that not even the powers of the existing Acts of Parliament passed to restrain this nuisance are fully exercised. By the Smoke Nuisance (Metropolis) Act, 1853, and the amended Act of 1858, expressly including potteries, it is enacted that 'the best practicable means for preventing or counteracting smoke shall be adopted, and that any person in charge of a furnace who shall so negligently use such furnace as to cause a nuisance, shall, upon summary

conviction for such an offence, forfeit and pay a sum not more than 5*l.* nor less than 40*s.*, and upon a second conviction for such offence the sum of 10*l.*, and for each subsequent conviction the sum of double the amount of the penalty imposed for the preceding conviction.' Nevertheless, in several cases recently tried before the magistrate sitting at the Lambeth Police-court, the prosecutions having been instituted in pursuance of the provisions of the Act, and the offences proved and convictions obtained, merely nominal fines varying from half-a-crown to 10*s.* have been inflicted. In some of these instances former convictions had been obtained. In some other parts of the metropolis similar leniency has been shown to offenders against these Acts, and the objects of the Legislature have been defeated. Your memorialists believe that investigation will satisfy you that these industries may be and are elsewhere being carried on without excessive production of smoke. Your memorialists pray that you will cause investigation to be made of the circumstances here alleged, and that you will take such steps as may seem best to you to cause the Smoke Nuisance (Metropolis) Acts to be effectually carried out throughout London. (Signed), WESTMINSTER, President of Council; ERNEST HART, Chairman of Committee of Council."

WAGES IN THE PARIS BUILDING TRADES.

A STATEMENT has been prepared by Mr. J. A. Crowe (the joint author of the well-known books on Italian art, but who is now Commercial Attaché to the British Embassy in Paris) on wages of some of the trades in Paris. It has been derived from statistics contained in two official publications, the "Annuaire Statistique de la France" and the "Série des Prix de Paris." The average earnings of an unfed workman in Paris were 4 fr. 63 c. in 1876, 4 fr. 78 c. in 1877, and 4 fr. 81 c. in 1879. The following comparisons have been taken from the "Série des Prix de Paris," and they show an increase in the rate of wages in the building trades of Paris varying from 40 to 50 and even 60 per cent. :—

	1875-76		1882	
	Fr. c.	Fr. c.	Fr. c.	Fr. c.
Navvies or daily labourers at earthwork . . . per hour	0 40	—	0 60	—
Stone-cutters, skilled "	0 75	—	1 20	—
ordinary "	0 55	—	0 85	—
Masons "	0 35 to 0 62	—	0 50 to 0 90	—
Paviors, foremen "	0 55	—	0 80	—
journeymen "	0 35	—	0 55	—
Building carpenters per day	0 60	—	0 90	—
Tilers and slaters, foremen "	6 25	—	8 00	—
journeymen "	4 25	—	5 00	—
Plumbers "	4 00	6 00	5 00	7 50
Carpenters "	5 00	6 00	8 00	9 00
	7 00	—	8 75	—
	4 50	—	6 25	—
	6 00	—	8 00	—
Smiths and locksmiths "	4 00	—	6 00	—
	5 25	—	7 50	—
	4 50	—	6 00	—
	4 00	—	6 00	—
Chimney-makers "	5 75	—	7 00	8 00
journeymen "	3 25	—	4 50	—
Marble-cutters "	5 75	7 00	7 50	8 50
Painters (decorators) "	0 60	—	1 20	—
ordinary "	0 60	—	0 80	—
Gilders per hour	0 70	—	1 00	—

According to a table furnished in December by the Chamber of Commerce of Rheims, the salaries of unfed workmen there in 1882 were :—

	Per Diem			Per Diem	
	Fr. c.	Fr. c.		Fr. c.	Fr. c.
Brick and tile trade and coachmakers	4 00 to 5 00		Painters	5 00 to 6 60	
Carpenters	5 00 6 00		Plumbers	4 00 7 00	
Joiners	4 00 6 00		Sculptors (decorative)	7 00 10 00	
Smiths	4 00 5 50		Locksmiths	4 00 6 00	
Masons	4 00 6 00		Stonecutters	4 80 6 60	
			Labourers	4 00 5 00	

EGYPTIAN EXPLORATION.

THE office of president of the Egyptian Exploration Fund has been accepted by Sir Erasmus Wilson, and he has headed the subscription list with a donation of 500*l.* With this aid the society has begun excavations at Tel-el-Maskhuta, in the Wady Tûmilat. The mound is the supposed site of Raamses, one of the two cities specified in the first chapter of Exodus as built by the forced labour of the Hebrews. M. Edward Naville, the Swiss Egyptologist, has, in co-operation with Professor Maspero, undertaken the direction of the excavations on this important site, where he is now at work, aided by an experienced engineer and a gang of eighty labourers. The results to be anticipated from discoveries at Tel-el-Maskhuta are inscriptions which shall enable Egyptologists to identify the Pharaoh of Moses, to assign a dynastic date to the period of the oppression, and to settle the much-disputed question regarding the route of the Exodus. More funds are needed for the prosecution of the work already begun.

THE PRIVATE BILLS OF 1883.

THE report by the Board of Trade upon the various railway and other Bills of the Session that has just commenced states that the number of applications for authority to construct new works of all kinds and for electric lighting powers furnish a less total than that for the Session of 1882. Taking railways and canals separately, however, there is an increase both in the mileage proposed to be constructed and the capital asked for. The Bills of existing companies amount to 96, against 104 last year; the proposed mileage is 623, against 591; but the capital is 31,537,632*l.*, against 36,863,798*l.* The Bills of new companies, including the Manchester Ship Canal and the Lancashire Plateway, which latter is 137 miles long, are 55 in number against 60. The lines to which they refer are mostly long ones, for the mileage proposed is no less than 1,164, against 789, and the capital asked for is 56,828,567*l.*, against 45,798,509*l.* There are 106 applications for Provisional Orders relating to electric lighting, the capital proposed being 2,752,778*l.*

GLASGOW ARCHITECTURAL ASSOCIATION.

THE fourth of a series of lectures was delivered in the room, 101 St. Vincent Street, on Tuesday evening, by Mr. W. P. Buchan, his subject being "Sanitary Appliances and their Practical Application." There was a good attendance, the president, Mr. H. Lawrie, being in the chair.

The lecturer in his remarks, which were illustrated by means of coloured diagrams, experiments, and actual specimens of several sanitary appliances, impressed upon the members the importance of their giving great attention to the principles of sanitation. He then reviewed the various kinds of sewer traps, from the earliest unventilated syphons to the latest modern type, warning against those which have their cleansing opening so placed as to give no access to the portion next house, which consequently becomes fouled without means of remedy. The trapping of lavatories, bath, and sinks was then noticed; then ventilation and flushing, with cautions against explosions, being very fully described. The necessity for ventilators in all soil-pipes was insisted upon, and this was proved by experiments with a model. The different patent w.-c.'s were then compared and commented on.

The discussion which followed was opened by Prof. Simpson, who acknowledged the great services rendered to practical sanitation by Mr. Buchan, and fully endorsed his views, giving several examples from his professional experience of the evils resulting from their neglect. He strongly condemned the Glasgow practice of ventilating the public sewers by means of gullies placed at the edge of the pavement, and advocated the trapping of such, the ventilation of the sewers to be effected by gratings placed in the middle of the street.

After several members had expressed their opinion, on the motion of Prof. Simpson, seconded by the vice-president, Mr. P. M. Chalmers, a cordial vote of thanks was accorded to the lecturer.

NORTHERN ARCHITECTURAL ASSOCIATION.

THE quarterly meeting of the Northern Architectural Association was held on Tuesday, February 20, in the Old Castle, the president, Mr. John Tillman, of Sunderland, in the chair. There was a good attendance. Mr. Oliver moved, "That the general rules of the Royal Institute of British Architects for the regulation of architectural competitions be adopted by the Northern Architectural Association, and that printed copies of the same be distributed by the secretary." He said it was pretty well known that the Corporation were about to erect several extensive blocks of buildings in various parts of the city, and that they had volunteered the information that the designing of these should be submitted to public competition. He (Mr. Oliver) being a member of the Corporation could not, of course, become a competitor, but he hoped to be of service in conjunction with both bodies—viz., the Corporation and the Architectural Association. He believed Mr. Laws, the City Engineer, entered heartily into the recommendations of the Council, and so far as he had been able to learn every member of the several committees wished to carry out the resolution of October 1881. The Royal Institute of British Architects, he continued, had given years of attention to the question of competition, and as it was one of the great art institutions of the country, he thought they could not do better than adopt their general rules, which fairly met the mere architectural adventurer and gave the balance of influence to the honourable practitioner, at the same time securing the interests of the public. Mr. Oliver concluded by saying that he believed the Council wished to do justice to the architectural profession, and that the legitimate members of that profession were most anxious to do justice to the works entrusted to them, and expressed a hope that the working out of the new régime would result in improved art culture, both in the profession and in the public. This was seconded and carried.

Mr. Newcombe proposed that a copy of the general rules be

forwarded to each member of the Newcastle and Sunderland Corporations, with a request that they would give them their best consideration, and adopt them in any architectural competitions they may decide to invite.

After an animated discussion the resolution was carried, and the meeting terminated.

THE ABERDEEN ART GALLERY.

THE acting committee appointed by the subscribers to the Art Gallery and Museum met on Monday afternoon in the Town Hall, for the purpose of receiving the report by Mr. George Reid, R.S.A., and Mr. Rowand Anderson, R.S.A., architect, Edinburgh, as to the set of the competing plans for the proposed new building in Schoolhill. Lord Provost Esslemont presided, and there was a large attendance of the members of committee. The adjudicators reported in favour of the plans submitted under the *nom de plume* of "Industry and Art." The committee, having again gone over the twenty-six sets of competing plans, agreed to accept the adjudication, and resolved accordingly. The *Aberdeen Herald* says that Messrs. Matthews & Mackenzie, architects, Aberdeen, are the successful competitors. The cost of the new building will be 5,000*l.* A committee was appointed to examine the working plans and specifications of the building. The following five gentlemen form the committee:—Baillie Donald, Baillie Hunter, Mr. John Fyfe (Kemnay Quarries), Mr. A. O. Gill (manufacturer), and Mr. Hay (Messrs. Hay & Lyall).

The Decoration of St. Paul's.

SIR,—Once more beneath the dome of St. Paul's, my mind reverting to the decoration scheme is at once oppressed and irritated. I feel that swearing "at large" would hardly be an appropriate mode of gaining relief, so I fall back upon the usual resource of the free-born Briton, and grumble through the press. To me it seems hardly credible that any man, still less credible that any committee of sane men, should waste the energy which has been wasted, or dream of incurring the additional expenditure of thought, money, and artistic labour required in decorating St. Paul's in the way which has been most generally approved. To-day (17th) was bright; the sunbeams streaming through the south windows illuminated the grand vault to an unusual extent, yet still left it in mysterious gloom. In vain I tried to imagine any propriety in fixing away up there Sir Frederick Leighton's magnificent work (of which you recently gave us such an admirable illustration), or any other work worthy of his brush. It would be absolutely thrown away—sheer and ridiculous wastery; while probably a better effect would be produced without the use of a single line on the dome. I shall not occupy your space by attempting to argue the point; it hardly admits of argument, but seems to appeal directly to the most ordinary kind of common sense. To my unsophisticated eye, what St. Paul's wants is a little bright colour in the windows, and its decoration would be complete—not of course hideous painted glass, but delicate translucent mosaic. There is no light to spare, and a very slight diminution of it would show how little mural painting was wanted.

One grumble more. It is possible, I hope, to admire the cartoon to which I have referred—*The Sea giving up its Dead*—as a work of art, and yet to regard it with extreme repulsion as a church decoration. Surely we have got beyond such gross materialistic views of resurrection life; the ghastly process of recovering dead bones with veritable flesh might have been left to the imagination of those able to imagine it without a portrayal which is only too revolting to be ludicrous.

Your obedient servant,
A COUNTRY ARCHITECT.

NEW BUILDINGS.

The New Alhambra Theatre.—It is authoritatively stated that although the Alhambra Company have not yet quite settled their differences with the companies in whose offices the destroyed Alhambra was insured, the directors, of whom Mr. H. Sutton is the chairman, have made financial arrangements which will admit of building being begun at once. The new theatre is to be completed, according to plans prepared by Messrs. Perry & Reed, John Street, Adelphi, before next Christmas, at a cost of 27,000*l.* It will contain all modern improvements in theatre architecture, especial care being taken to provide capacious and convenient entrances, corridors, and exits. The lease of the site upon which it will replace the old edifice has yet twenty-eight years to run.

LEGAL.

Crewe County Court, Feb. 16.

(Before Mr. THOMAS HUGHES, Q.C., Judge.)

SACKFIELD v. ATKINSON AND POTTS.

LIABILITY OF ARCHITECTS.

This case, which was four days before the Court, was concluded at a late hour on Friday week. The plaintiff was James Sackfield, timekeeper in Crewe Works, who claimed from Mr. J. A. Atkinson, architect and civil engineer, and Mr. J. B. Potts, builder, 50% for alleged breach of contract in the erection of two houses for him in Delamere Street. The case involved a curious point of law—whether or not, in the absence of a specific charge of fraud or collusion against the defendants, any cause of action lay against the architect.—Mr. Lamb, barrister, who appeared for Mr. Atkinson, contended that if fraud was not imputed at the outset of the action, even if it were proved subsequently, it could not be taken as evidence against his client.—The Judge, however, overruled the objection, and the case was tried on its merits.—In the early part of last year Mr. Atkinson prepared plans and specifications for the plaintiff for two houses. He (the architect) invited tenders, and out of three accepted Potts's as being the lowest (46%). The buildings were completed in about four months, but when the last instalment of money under the contract became due the plaintiff wished to retain 30% in order to see whether any defects became apparent. The builder objected to this, and on receiving an assurance from the architect that 12% retained under the "maintenance clause" would be sufficient to meet any contingencies of this kind, plaintiff paid the whole of the money. He soon found, however, that there were serious defects in the houses. One of the chimneys smoked badly; the walls were not plumb; the tiles were not properly laid, and many in the passage were broken. The plans had been departed from, and the specifications not adhered to. The suggestion of the plaintiff and his witnesses was that the mortar was in large measure mere mud, that the bricks were inferior, that the doors were so thin as to be almost useless for the purpose, and that the woodwork generally was bad. The Judge and the learned gentlemen on either side visited the houses and examined the work.—On returning to court his Honour said he thought when the gas pendant was pulled that the ceiling was coming down. He observed light admitted into the gable from three defects in the walls.—The defence was that the materials used were the best that could be got in the district, but the admission was made that one or two little items set forth in the specifications had not been done.—In giving his decision, the Judge commented strongly on the conduct of the defendants. The architect, he said, visiting the buildings every day as he did, should not have passed over the materials that had been used. It was his duty to protect the plaintiff, and a comparatively inexperienced man might easily have detected that the materials that were being used were not according to the specifications. The position of the architect ought to have been that of a quasi-arbitrator between the parties, but Mr. Atkinson lost that position and passed over work that had been "scamped." He should give a verdict for the plaintiff for 50%, with costs on the higher scale. A set-off of 12% for the "extras" was allowed.—His Honour said he hoped it would be a warning to both the architect and his co-defendant.

GENERAL.

Sir Coutts Lindsay, Bart., has accepted the presidency of the Sunday Society. The permission to the members to visit the present exhibition of the Grosvenor Gallery will, however, be withheld, owing to the risk of damage to the paintings from overcrowding.

Mr. R. H. Edmundson has presented to the Manchester Art Gallery a small collection of ancient textile fabrics, the property of the late Mr. D. G. Rossetti, which it is hoped may not be unworthy to stand by the side of the fine collection of Dr. Bock, just acquired by the Art Gallery Committee. Mr. Rossetti's collection is that of an artist rather than of a collector of curiosities; many of the pieces are of large size, and some are duplicates.

Mr. Irving, clerk of works at Lichfield Cathedral, was on Tuesday elected an honorary member of the Derbyshire Archaeological Society.

Mr. J. L. Pearson, R.A., after his survey of the parts yet unrestored of the parish church at Yarmouth, has recommended works of restoration for the south transept and west end of the nave, the estimated cost for the former being 1,249%, and for the latter, 1,025%.

C. Pfoundes gave a lecture at the Wimbledon Art College on Saturday upon "The Art of Old Japan." On Wednesday next Mr. Pfoundes will read a paper before the Royal Society of Literature on "Art and Literature: their Connection, illustrated

by the Harmonious Alliance of the Literature and Art of Old Japan."

Windsor Castle.—On Saturday the employes of the Office of Works at Windsor Castle erected a hoarding in Thames Street, at the base of the Curfew Tower, the ancient walls of which are in a weatherworn and dilapidated condition, pieces of stone flaking off occasionally during rough weather and falling on to the pavement below.

A Theatre is proposed to be erected in Durham, and a company for carrying out the project has been formed.

At the Leeds Architectural Society, on Monday evening, Mr. Geo. Bertram Bulmer read to the members a paper on "The Wakefield Town Hall." After giving a full and interesting description of the various parts of the building, Mr. Bulmer pointed out that the designer of the building had availed himself of modern materials and modes of construction, as well as drawn many an inspiration from the knowledge of the works of those who had gone before.

Darlington Hospital.—The committee of this institution met on the 16th inst. to appoint an architect for the proposed new building. There was a very large attendance. Mr. W. C. Parker moved, and the Rev. T. E. Hodgson, Vicar of Darlington, seconded, that local architects be invited to submit plans in competition. The motion, however, was lost, and Mr. G. G. Hoskins, F.R.I.B.A., of Darlington, was appointed to carry out the new building with only one dissentient vote.

Birmingham Architectural Association.—An ordinary meeting of this association was held at Queen's College last week, under the presidency of Mr. W. H. Kendrick, the attendance being large. Mr. G. Kenwick was elected an honorary member. A lecture was delivered by Mr. J. M. Gething, of Kidderminster, on "Some Errors in Construction," the subject being illustrated by a series of drawings. A discussion followed, and a hearty vote of thanks was proposed by Mr. R. B. Morgan, A.R.I.B.A., seconded by Mr. F. E. F. Bailey, A.R.I.B.A., and supported by Messrs. T. Jones, W. G. Mantle, H. Cleve, V. Scruton, and Franklin Cross (hon. secretary).

Plans for New Harbour Offices, Aberdeen, prepared by Messrs. Matthews & Mackenzie, have been adopted, omitting for the present the central clock tower. The cost, inclusive of tower, was estimated at about 7,000%.

Mr. C. Barry's plan for roofing the area of the Royal Exchange has been adopted. The expense, 12,000%, is to be divided between the Corporation and the Mercers' Company.

A Reredos, designed by Mr. Crowther, architect, Manchester, is proposed to be erected in Eccles parish church.

The Manchester Academy Exhibition of Fine Arts opened to the public on Wednesday.

Mrs. Gibbs, of Tyntesfield, Bristol, has offered to present a chaplain's residence to the British Seamen's Orphan Home at Brixham, provided a sum of 1,000% is raised as an endowment fund for repairs.

Mr. T. Woolner, R.A., has been entrusted with the commission for the recumbent statue of the late Lord Frederick Cavendish, which is to be placed in the Priory Church, Cartmel, Lancashire. A memorial window by Mr. Holiday is also to be placed in St. Margaret's Church, Westminster.

Mr. Henry Hughes, of the firm of Ward & Hughes, Soho Square, London, artists in stained glass, died suddenly at the Golden Cross Hotel, Bromsgrove, on Saturday last. Mr. Hughes arrived at Bromsgrove to superintend the erection of a stained glass window in the parish church. He was sixty years of age.

A Scheme for the erection of public baths in Carlisle has been decided on. The cost, which is estimated at 6,000%, is to be defrayed out of the profits of the gas-works.

New Buildings for the police head-quarters are to be erected at Lewes, from the plans of Mr. Henry Card, county surveyor. Messrs. Rowland & Son, of Horsham, are the contractors for the work.

Messrs. G. M. Hammer & Co. have supplied the whole of the school furniture for the Finsbury Technical College.

The De Vos Collection of Old Masters' Drawings is to be sold by auction this spring at Amsterdam. In this collection are drawings of Rembrandt, which are not only finer and more numerous than those of any collection in private hands, but which actually rival those of the Albertina, at Vienna, in importance.

A Meeting of the shareholders of Perry & Co., Limited, was held in Birmingham on Tuesday last. Since the formation of the company the directors have placed annually a large sum to the reserve fund, for the purpose of providing a fund for depreciation on machinery, leases, buildings, and goodwill, but although they have written off the sum of 15,015% for the depreciation, it was not necessary for them to trench on the reserve fund. A dividend equal to nine per cent. was declared on the ordinary shares. The profit on trading during last year was 20,905%, and the value of the company's assets is 359,367%.

SUPPLEMENT

TO THE

ARCHITECT

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, FEBRUARY 24, 1883.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*** Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—
"Contract Supplement to THE ARCHITECT."*

The Architect.

YOUNG ARCHITECTS AS CLERKS OF WORKS.

HE Clerk of Works is a functionary of considerable importance in the scheme of building operations when conducted on any considerable scale, and the idea which is now and then suggested that it might be as well to employ in that capacity the architectural student who stands between pupilage and practice is one, whether right or wrong, which is well worthy of consideration for

the sake of both the office and the candidate.

It need not terrify the reader, or even embarrass the writer, to remember that WILLIAM OF WYKEHAM was "Clerk of the Works" at Windsor in the reign of HENRY III., and that CHAUCER bore the same title a century later. The modern official of the name is neither ecclesiastic nor poet, nor indeed anything better generally in the way of genius than a promoted foreman of carpenters; his condition of promotion, indeed, being often questioned as a point of dignity by the representative of the contractor who serves under him, and who is a foreman unpromoted, he will say, simply because he is neither old nor indolent, nor, it may, perhaps be, given to drinking.

The clerk of works, as a matter of fact, is in too many cases little else, even in the intention of the architect, than a police officer, set to watch the proceedings of the builder and his foreman, as one who knows the tricks of the trade from having practised them himself. This account of him may be pronounced disrespectful, if not scurrilous, especially as there now exists something like an "Institution" or National Guild of Clerks of Works, with the object in view of asserting the dignity of the office, and indeed of magnifying it and making it honourable, by constituting the certificate of membership a diploma of professional merit; but we are obliged, for the sake of our present argument, to begin upon the very naked truth, and this must be our excuse for such plain speaking.

When the clerk of works at his ordinary best is encountered upon a building of moderately high pretensions, he is found to be a builder's foreman precisely; a man, that is to say, who a few years or months ago was actually the job-manager on the spot of one contract after another, in the standing employment of the contractor, and who, moreover, if he should fail to obtain another appointment two or three months hence in his present capacity, will cheerfully enough go back to his occupation of foreman again. He is only now in the employment of an architect instead of a builder. He holds testimonials from architects who have formerly employed him, and from builders too; and if he tries to keep in the architectural connection rather than the other, it is chiefly because of the lighter work, not even the greater pay. This lighter work, he will tell you frankly enough, is to represent the architect—he has been called "the eye of the architect"—in seeing the contract properly carried out according to the plans and specification. He scrutinises the materials as they are brought on the ground; he examines the stone, and looks with a critical eye at the bricks, the lime, the cement, the sand, the slates; he turns over the timber and deals; he cuts out square feet of the lead and feet run of the piping, and weighs them; he watches the bricklayers in a vain endeavour to compel them to make solid work; he particularly watches the laying of the drains, and this, unfortunately, to less purpose than might be, if we are to believe Dr. CORFIELD and his sanitary engineers; and thus, from first to last, to cut a long story short, he fusses about the job (as the enemy puts the case) trying to find fault if he can, and to find something to do if he can't. It is to be feared, therefore, that the typical clerk of works is not always able to get rid of a slight sense of shame, especially when he has to do with a contractor of high class; and it is also very likely that the feeling which he inspires in the minds of the artisans whom he is supervising is not wholly devoid of disdain.

Now this unsatisfactory condition of things, as regards the individual, is in a great measure due to the pretty obvious fact that he is the representative of a principle of nominal promotion that is not real promotion. That is to say, the builder's

foreman who becomes the architect's clerk of works is not, as he ought to be, even a picked man who is elevated from the rank of corporal to that of sergeant. Compare together on a typical work the foreman and the clerk of works, and it is a mere accident which is the better man, whether in education, in skill, in character, or in pocket. Consequently, if we apply to the case the law of average, we may regard the two as equal agents, incidentally opposed to each other for the moment; a thing that cannot be said regarding the principals they represent, of whom, at any rate, the one is a man of the counting-house and the other a man of the studio—the architect, that is to say, if he be worthy of the name, being the intellectual director of the builder. Why, then, should not the clerk of works be the intellectual director of the foreman—indeed, of the builder as well?

It is a question of this kind that brings before us in proper form the point in view. Ought not the representative of the trained architect to be a trained architect also? At first sight it seems impossible to reply otherwise than directly and finally in the affirmative; and those who advocate the principle will probably be permitted to go so far as to say that the only ground upon which objection can be offered is the fact, if it be a fact, that trained architects cannot be found to accept the position, or rather that those who would accept it would not be qualified to do the duty. This is matter, therefore, for inquiry.

A young architect, acting as clerk of works, ought of course to be what is called a good practical man. Those services which one who is only a builder's foreman cannot perform, namely, the interpretation of the design in an artistic way and the direction of the workmen in an artistic spirit—indeed, we may speak of the like interpretation and direction scientifically none the less—a good architectural assistant can render with every facility; but when it comes to the supervision of matters of mere trade, such as the quality of goods and workmanship, no doubt it would be a special question to raise whether a man brought up to his business in a drawing office could profess to be competent. If he could, then perhaps the only other consideration is whether he would be satisfied with the customary remuneration. So far as regards personal dignity and character, the advantage would be as palpable as in respect of artistic taste and scientific construction, but what is to be said as to tradesmanship and salary?

We take leave to say with reference to the first of these points that we see no real difficulty. It is often affirmed that many a young architect beginning practice owes, if not his success, his escape from failure, to the aid he receives from a good practical clerk of works. Supposing this to be the fact, however, it does not touch the proposition before us. If an inexperienced youth, as architect, were foolish enough to employ another inexperienced youth as clerk of works, with a sharp practitioner for contractor, no doubt the blind would be leading the blind, and both might fall into the ditch; but in the case of a somewhat unpractical young assistant being employed as the lieutenant of an experienced architect—which is much more likely to be the worst of it—we venture to think even the most inconsiderate contractor might be sufficiently kept in check, and all the work of supervision accomplished with small risk, granting only a little extra care which the principal would be sure to exercise.

Upon the question of remuneration little need be said. It is to be feared, indeed, that there are only too many architectural assistants just now, and so-called practising architects as well, who would be glad of the salary which would be earned, even if it were not, as it well might be in many cases, somewhat augmented for the sake of the superior character of the duty to be done. Not only so, but, amongst the various supplementary services into which those who may be called the less successful members of the architectural profession are now finding their way, surely the fulfilment of the function of clerk of works need not be considered otherwise than most suitable. Of the direct opportunity that might be offered for stepping into independent business we will say nothing.

Without going more minutely into particulars, we feel every confidence in advocating the introduction of the principle of an architect's representative being an architect. No doubt there are many instances that may be cited in which there might be one difficulty or another, and occasionally more or less disadvantage, perhaps; but it is easy to imagine the case of a high-class building, upon which the lieutenant of a high-class architect, being inferior only in age and experience, and

improving daily in both respects, is able to conduct himself with infinitely greater effect in every way than the mere old foreman, who under the present system watches, or pretends to watch, so very much more than is necessary or agreeable, and works so very much less to any really good purpose. We need not allude to instances, especially in difficult church work, where this arrangement has been exceptionally carried out as matter of absolute necessity, and the great advantage of it abundantly evidenced; but it is well known that such cases are to be found in sufficient numbers to give practical force to our argument. We cordially recommend the principle on its merits, both to those architects who would be the employers and to those who would be the employed.

PAINTED GLASS.*

ANOTHER instalment has appeared of Mr. WESTLAKE'S work on stained glass, which represents archæological research as well as practical skill. The original plan is retained. The best examples of the different periods are described in succession, attention being given to detail; and the illustrations, although wanting colour, are of such a character that they suggest the originals. When complete, the work will be one to which the artist and the amateur can have recourse with confidence.

The new part treats of the glass produced in the fourteenth century. This period is of great importance in the history of the art. There was, as the century progressed, greater departure from the system which was followed in the earlier periods. In the twelfth and thirteenth centuries the subjects on the windows were generally flat in treatment, not necessarily because it was the best style, but rather that the artists found some difficulty in giving relief to the figures, and in expressing distance in the backgrounds. The windows were, in fact, mosaics, and exemplified the traditions of Byzantine art. But whether for good or evil, towards the end of the thirteenth century a new spirit was manifest, and by the end of the fourteenth century not only was the character of the glass altered, but the figures were more pictorial. There is, indeed, a closer relation between modern glass and fourteenth century glass than with the glass of the thirteenth century.

It is pointed out by Mr. WESTLAKE that one of the noticeable circumstances of the era was the extended use of grisaille. If the state of popular opinion could be ascertained in the fourteenth century, it would most likely be found to be opposed to that class of work. Richly coloured windows were of interest not only from the subjects, and when regarded as pictorial Bibles and church histories, but from the beauty of the rays which they cast through the church to the pavement. We can imagine how often people who were weary of life, but who were possessed of faith, looked on those rays as if they were luminous pathways to some place of rest; especially on occasions of emotional excitement like great festivals, when the light became more mysterious as it appeared through clouds of incense. But, whatever may have been the loss to the people through the use of grisaille, it was compensated by the new features which were then introduced. The most remarkable were the canopies and tabernacles, which were more elaborate in their details than the churches, for the designers were not restricted by material considerations. The borders of the windows were made of great richness, and sometimes contained foliage which was familiar with some that was conventional. Angels playing on musical instruments were often represented, and formed a contrast with the scenes of martyrdom which were often the subjects of the windows. There were also changes in the manipulation, the most remarkable being the use of the yellow stain. On this part of the subject an extract from Mr. WESTLAKE may be given:—

The quality and character of the glass in the earliest Decorated work differ very little from that used in the preceding century; but as the style assumes its latest phases, especially when the Perpendicular characteristics commence to preponderate, the glass becomes somewhat flatter and more even in tone; this is especially observable in the ruby, which was then generally diapered. It, however, never had that flat and washy character common in painted glass fifty years ago, and which one still sees in much German, French, and bad English work.

The flesh-colours in the commencement of the century are still

tinted with various carnations, lighter or darker; but there is gradually an introduction of white heads and extremities, which by the commencement of the fifteenth century was nearly universal.

The leading and more pronounced of the characteristics resulting in an entirely changed appearance of art as developed in the fourteenth century, when compared with those of the previous one, appear to be as follows:—Concerning the drawing of the figures, the draperies are longer and more flowing, the folds being longer and more modelled; the vestment or alb is long, and covers the greater portion of the feet; whilst in most examples it is tight or nearly tight at the wrist, with greater fulness from the elbow to the juncture of the armhole and body of the dress, which is full, but gathered at the waist into folds, which frequently hang over the girdle in a graceful way. The pallium or cloak is thrown over the figure in various ways, often designed apparently to produce "cascades" of drapery, in which the lining—generally of a different colour—is made to relieve and pronounce the folds. As we approach the end of the century, costume begins to be of greater variety; fashions become evident, especially in head-gear and over-garments; long pointed shoes are often worn; diapered patterns are frequently used on all articles of dress. Plate armour gradually supersedes the use of mail, whilst the crests, surcoats, and other appanages of the knights, together with the caparisons of the horses, often render the figure scenes most picturesque.

Mr. WESTLAKE divides the century into three periods: (1) Early Decorated to 1325, in which the glass was marked by reminiscences of the work of the previous century; (2) Middle Decorated to 1360, characterised by peculiar details, such as depressed and curiously cusped arching; and (3) Transitional or Early Perpendicular, marked by great delicacy of the lines of the figure, white draperies, &c., and other tokens of a German influence. Examples of these periods are analysed in rotation. Mr. WESTLAKE begins with single figures, such as those which are found in Merton College and St. Michael's, Oxford, North Luffenham, and Tewkesbury. Some of them display much power. At Wells the Temptation is represented, and the demon has an angel's head, wings, and arms, while the lower part is serpentine and of an immense length. There is a figure of St. GEORGE in St. Peter's, Aldwinkle, and dogs are freely introduced in the borders. Mr. WESTLAKE believes that in those days there was a royal atelier for glass painting in England or Normandy, like the tapestry and pottery works which still exist abroad; but he also believes that there were local schools in this country which differed much in their character. Some schools were progressive, and others were conservative. When describing the glass in St. Mary's, Shrewsbury, Mr. WESTLAKE says it is evident that "whilst one atelier or local school has been anxious for new ideas, and adopted every change of fashion, others were content to go on either in using the old drawings of some favoured and distinguished artist, or in following the traditions laid down by him." The windows in the west side of the nave and the western aisle windows in York Cathedral belong to this time, and they are not only fairly preserved, but their history is known from documents which still exist. White glass is employed, and the reasons for introducing it are suggested in the following passage:—

Coloured glass is estimated to cost twice as much as the white. May we not infer from this, that the growing tendency to have whiter windows arose, in the first place, from economical motives? But our ancestors probably found also that it was capable of making very beautiful windows, and of transmitting more light. But it eventually must—from the growing artistic treatment of the white glass—have become more expensive than the old windows of full colour. There is no doubt but that there are dark buildings which require more colour in their windows than others more light, and as a question of taste the present war-cry of "more white" is perhaps a fashion that will—if circumstances require it—be amended, as both white and colour are good according to the use made of them.

It is remarkable to find in York figures of archbishops wearing vestments which are not of the prescribed colours, an error which, however excusable in modern times (it is even found in a coloured drawing by Mr. BURGESS), is unaccountable when seen in fourteenth century work. Mr. WESTLAKE appears to admire the tracery at York more than the glass it contains. "It is," he says, "of a subtle beauty of form to which no drawing has yet done justice, and of a spirit and character which amongst our modern revivals no one seems to have had the genius to imitate." Mr. WESTLAKE is of opinion that when greater delicacy was desired in the shadows a softer pigment was used. The straw-ash flax resists tests, but in spite of its use the grey pigments in modern work need care in conservation. Mr. WINSTON, if we remember rightly, advocated the use of an

* *History of Design on Painted Glass.* By N. H. J. Westlake, F.S.A. Vol. II. James Parker & Co.

alkaline wash, as, according to him, it had the effect of making the colours appear purer; but Mr. WESTLAKE is more prudent when he says it is unwise to clean painted windows. Among other windows belonging to the first part of the fourteenth century are those of Tewkesbury, which form a link between the work in Bristol, Wells, and the east window at Gloucester. The last was described at much length by Mr. WINSTON, although he was unable to admire the figures. As he once acknowledged, all his early associations and his pagan education connected him with the Greeks, and, in spite of his enthusiasm for Gothic glass, he could not appreciate Gothic figure drawing. Mr. RUSKIN's maxim was that we can never produce a good painted window with good figure drawing in it; but Mr. WINSTON thought it was possible to combine beautiful colours with exquisite drawing, and if the experiment were made the modern mediævalists might, he said, be shamed into some improvement.

The second chapter in Mr. WESTLAKE's volume treats of medallion windows in England. Few have survived. The most interesting examples are to be found in York; those in the grisaille windows of the chapter-house are a connecting link between the old medallion and the modern subject window. There is another splendid series in the aisles of the cathedral, and Mr. WESTLAKE rightly displays an interest in the Bell-founder's Window, the gift of RICHARD PENNSE, who was proud of his craft. Another remarkable window is a memorial of PETER DE DENE, whose vicissitudes, like those of ABELARD's in an earlier age, denote the power of the Church. Through his life PETER was an unattached priest, he lived in Courts and among great people, and he was evidently an able man, but he had no more liberty than the humblest brother who spent his life within a monastery. Ecclesiastical authority was always ready to claim him, and by it he was at one time imprisoned, yet he never seems to have invoked the secular power to protect him.

In his third and fourth chapters Mr. WESTLAKE describes the corresponding French work in Chartres, Evreux, Troyes, Beauvais, Amiens, Rouen, &c. The resemblance between the works in the two countries is well known, but there is a remarkable difference when fourteenth century works are compared. Mr. WESTLAKE says:—

As far as my experience teaches me, the changes which characterise English art from its Decorated to its Perpendicular styles do not seem to have so affected French art. This is surprising, when we have hitherto seen such an intimate connection between the earlier designs of the two countries, that it became difficult to tell which was an English, which a French idea. Was it possible that the marriage of EDWARD III. with PHILIPPA OF HAINAULT, and the increased commerce between Flanders and our Eastern coasts occasioned the greater resemblance between the German and English work than had hitherto been the case? Or it may have been, as M. VIOLLET-LE-DUC suggests, the stagnation of the art in France on account of the distressed state of the country, or perhaps it was an attachment to the Decorated style.

The subject of the fifth chapter is stained glass in Germany in the fourteenth century. It is perhaps sometimes undervalued when contrasted with the glass produced in the following century, much of which is supposed to have been inspired by ALBERT DÜRER. But Mr. WESTLAKE upholds the merit of earlier work, and we may infer that DÜRER was indebted to it. "The world," he says, "has yet to learn how little of originality there was in that great and indefatigable artist." Italian glass is next considered, and much of the information about the artists is derived from Padre MARCHESE's volumes; but Mr. WESTLAKE is in error when he says that the author of the English translation of that work is a Dominican. There are many beautiful examples of glass painting to be found in Florence, but few are to be discovered in Venice, Murano, Verona, and Padua, cities in which the art was practised.

The seventh chapter treats of grisaille and quarries in England. It is curious to find that Mr. WESTLAKE has yet to see the windows in Exeter Cathedral. He does not value them highly, and is of opinion that they came from some third-class *atelier* in France. The difference between ancient and modern art is suggested in the following passage:—

The principles on which coloured glass should be executed appear to be clear to demonstration; yet nothing is more difficult than to get them strictly and properly applied. We have the advantage of seeing the mode adopted by the old artists, and we cannot do better than follow in their example. Shortly it may be stated that their habit was to use a pure white glass for painting on, of thick but unequal substance, and that their coloured glass—

or pot-metal, as it was called—was not over-much varied. As a rule, they used one blue, one green, one yellow, one ruby (varying, of course, with its varying thickness), but none of those new and violent colours with which it is the custom of modern glass manufacturers to tempt the glass painters to their ruin. The glass was all, as a rule, thick; it was chipped or nipped with pincers round the edge instead of being clean cut with a diamond, and was finally all painted by hand without a carefully-prepared cartoon, and, consequently, by a man who was an artist, and could draw instead of only being able to trace. The consequence is that old glass is full of that life and variety which is the very salt and essence of good work, inasmuch as it shows that the work was not task-work, but entirely done with pleasure to the doer of it. It has the vast advantage over new work that it has upon it the accumulated incrustation of ages. This leaves portions as brilliant as ever. Only too often the modern painter on glass "antiquates" his glass, trying to give it artificially the effect which centuries of exposure have given the old. But this device is not satisfactory, for it is always to be feared that glass antiquated in this fashion will not improve by age.

AN ARCHITECT'S RESPONSIBILITY.

[BY A BARRISTER.]

THE extent to which an architect may be made liable for the negligent performance of his duty has been established with a tolerable degree of precision in the cases which have from time to time come before the Courts; but the question yet remains, and it is one of considerable interest, how far and under what circumstances an architect may by his conduct lay himself open to a charge of breach of duty, both towards his employer and towards the contractor, by acting in such a manner as to afford reasonable ground for doubting the disinterestedness of his motives—in other words, what conduct on the part of the architect will lay him open to a charge of constructive fraud in his dealings between the parties?

It has been attempted over and over again, but hitherto without success, to charge the architect with liability for the negligent performance of his duty, that duty being one to the discharge of which the exercise of judgment and opinion is necessary. There is, it is true, an example recorded which would seem to give some encouragement to the view that an architect or surveyor is so liable. In that case the defendant was a surveyor, who held himself out as specially qualified as a valuer of ecclesiastical property, and it was admitted that the defendant had in this particular instance failed to observe the distinction between the case of a valuation as between incoming and outgoing tenant, and a valuation as between incoming and outgoing incumbent. Chief Justice JERVIS thought that the surveyor could not be expected to supply minute and accurate knowledge of the law, but that, under the circumstances, he might properly be required to know the general rules applicable to the valuation of ecclesiastical property and the broad distinction between the cases of an incoming and outgoing tenant and an incoming and outgoing incumbent, and that inasmuch as it appeared from the evidence that the surveyor acted in the valuation as if it were the case of an outgoing and an incoming tenant merely, and that he knew no other rule.

It was held accordingly in this case that, although the surveyor was not bound to possess a precise and accurate knowledge of the law respecting the valuation of dilapidations as between outgoing and incoming incumbent, yet that he was bound to bring to the performance of the duty he had undertaken a knowledge of the general rules applicable to the subject, and of the broad distinction that exists between the case of a valuation as between the case of an incoming and outgoing tenant, and a valuation as between an incoming and outgoing incumbent. It will be seen that in this case the surveyor held himself out as being specially qualified for particular work and failed to perform it, and that his negligence did not involve the exercise of his opinion or judgment, but an absolute and culpable neglect to perform a specific work which he had undertaken to do.

In a case in which the plaintiff sought to charge the architect with responsibility for an inaccurate bill of quantities, on the faith of which he had entered into a contract, Lord COLERIDGE observed that the action would have been maintainable if it could have been fairly contended that the relation of the parties was this, and this only—that the plaintiff had undertaken to do certain work under a contract with a third person; that the contract was one to which the defendant was in terms

no party; but that he was aware of it and had acted under the duty which it imposed on him of doing certain work requiring no judgment or opinion, but what he might call the exercise of ordinary arithmetical powers, and that his performance of that duty under the contract was necessary to enable the plaintiff to recover his money, and that he had neglected that duty. If that was the true construction of such a contract, he was of opinion that an action would lie, for none of the cases cited in the argument were cases in which the imposed duty was such as he had described, and the breach of duty of the nature that he had indicated. The present claim, however, was not such an action, but was really an attempt to bring an action for negligent performance of duty, to the discharge of which the exercise of judgment and opinion was necessary. It was held that in the absence of fraud the action was not maintainable.

It was of course conceded in the case to which we have last referred that the exercise of judgment and opinion on the part of the architect were necessary to enable him to take out the quantities, and the principle upon which this decision was founded may be further illustrated if we suppose the case of a builder seeking to charge his employer with liability for the inaccurate quantities supplied by the architect. The defendant employed an architect to prepare plans and a specification for a house, and to procure a builder to erect it for him. The architect took out the quantities, and represented to the plaintiff, a builder, that they were correct, and the plaintiff thereupon made a tender which was accepted. The quantities proved to be incorrect, and the plaintiff expended upon the building a much larger amount of materials than he contemplated. It was held that there was no evidence that the architect acted as the defendant's agent in taking out the quantities, or that the defendant guaranteed their accuracy, and that therefore the plaintiff could not recover more than his contract price. These examples are sufficient to illustrate the principle that an architect is bound to bring to the discharge of his duty ordinary skill and ability, but that he cannot be rendered liable for the consequences if his judgment, honestly exercised, should turn out to be erroneous, or if his opinion, given in good faith, should be found to be wrong or inaccurate. Where, therefore, the exercise of judgment or opinion on the part of a third person are necessary between two persons, and in the opinion of one of the two such opinion or judgment has been wrongfully or negligently exercised, no action can be maintained against a person standing in the position of a third party, that is to say, the architect.

But there is another light in which the relation of the architect both to the builder and employer should be viewed before we can accord to him absolute immunity from the consequences of his apparently erroneous opinion or negligent or unskilful discharge of duty. The architect is bound to act with strict probity and impartiality in his dealings between the parties. He must enter into no secret or tacit understanding either with the builder or with the employer, neither must he act in any other manner inconsistent with his duty to both. His position is founded on the assumption of his integrity and impartiality, and if he by his acts affords reasonable ground for presuming that his opinion or judgment has been biassed or influenced in a manner inconsistent with such an assumption, he becomes at once liable for whatever injurious consequences may follow to either party. Where, for example, the architect was appointed arbitrator in respect of extra works under a builder's contract, and it was proved that the architect had guaranteed to his employer that the total cost should not exceed a specific sum, but that that fact had not been disclosed to the builder at the time when he signed the contract, it was held that the guarantee was a material fact tending to influence the architect's decision, and as it was not disclosed to the builder, he was not bound by the submission to the architect's arbitration.

A case has, in fact, been recently tried at the Crewe County Court in which this very important question was raised and discussed, and the facts of which illustrate very forcibly the delicate and responsible nature of an architect's duties. The employer claimed damages against the architect and builder jointly for a breach of contract in erecting two dwelling-houses. The plaintiff, it seems, employed a Mr. ATKINSON, an architect, to prepare for him plans and specifications for the erection of these two houses. Tenders were invited, and eventually the tender of a Mr. PORTS, the other defendant, was accepted to build the houses for 460*l*. The plaintiff alleged that PORTS had used inferior materials in the construction of the houses, and that ATKINSON had passed over the defects without correcting them, or com-

plaining of them or of the inferior materials used. There does not seem to have been any suggestion of fraud or collusion made by the plaintiff in the first instance, and the objection was rightly taken that no cause of action existed under such circumstances, there having been the usual condition imported into the contract to which the plaintiff and the defendant builder were parties, that the work should be done to the satisfaction of the defendant architect. But it would seem that the evidence, so far, disclosed sufficient facts to induce the judge to hear the case and reserve to himself the power of determining whether there had been such fraud in the transaction as would allow the action to be maintained. From the evidence, and the eventual decision of the judge, there could be no doubt that the materials used in the erection of the houses were of a very inferior quality, that the work was not done in accordance with the specification—in fact, that the work had been “scamped” throughout. The architect, however, had passed the work, and the builder was entitled to his money. So far, therefore, however bad the work or inferior the materials, the architect, being chosen arbitrator between the parties and having passed it, the plaintiff had no redress. But other facts were disclosed in the course of the evidence which led the learned judge to the conclusion that the architect had acted in a manner inconsistent with his duties towards the parties under the contract, and that under such circumstances the contract could not be considered conclusive against the plaintiff. It seems that Mr. ATKINSON, the architect, had been in the habit of preparing plans for PORTS, and that this fact was not communicated to the plaintiff at the time when the contract was entered into. The judge rightly termed this an unfortunate thing, but unless this fact were coupled with other circumstances it could not be considered of sufficient importance to ground an allegation of fraud against the architect. But it appears that the architect had handed over to the builder the plans and specifications for the work, and had not even kept copies which he was bound to do for the protection of his employer, and had altogether acted in a manner inconsistent with his duties towards his employer. In giving judgment in the case the learned judge observed that both the defendants had perfect cognisance of facts which, if they had been disclosed to the plaintiff, made it quite certain that he would not have allowed the defendant Mr. ATKINSON to be an arbitrator between him and PORTS in respect of those two houses. PORTS had gone about the work in a very loose manner, not having, as he himself admitted, read the specifications before he took the contract. An architect in ordinary cases would have had a copy made of the plans and specifications, and kept them for the protection of both parties; but here it was shown that Mr. ATKINSON had handed over the plans and specifications to his co-defendant, who lost them, and an action had to be instituted for their recovery. Alluding to the evidence as to the repairs needed, the learned judge remarked that several matters included in the specification had been altogether omitted, and that very great defects existed in the work as it stood. He proceeded to give judgment for the plaintiff in respect both of the defects in the work and inferior quality of the materials used.

An architect cannot be too scrupulous in his professional conduct, and if he stand towards the builder in such a position as to render it impossible for him, in the judgment of reasonable men, to act in an honourable and impartial manner towards the employer, by reason of conflicting interests or engagements hostile to his employer's interests, he is bound to disclose all such facts to his employer before he accepts a position incompatible with any such relation or engagements. Should he fail or neglect to give his employer information of such material facts, he will be held liable in consequences, which may be disastrous both to his pocket and to his reputation.

PARIS NOTES.

THE Paris gas question has terminated for the present in an open rupture between the Municipal Council and the Company. The former, after a debate which lasted several days, adopted by an overwhelming majority the conclusions of the committee appointed to consider and report upon the matter. This vote calls upon the Prefect of the Seine to issue a simple decree reducing the price of gas to private consumers from 30 c. to 25 c. per cubic metre. Thus all attempts at a compromise have failed; and as the Company contests the legal right of the Prefect to reduce their prices, a costly lawsuit seems to be inevitable. It

is possible, however, that the Prefect may refuse to act upon the recommendation of the Council. The real point in dispute is not so much the question of price as of a renewal of the Company's monopoly for a further term after its expiry in 1905. The Company, indeed, offers to lower its rates to the 25 c. per cubic metre, but demands in return an extension of its powers for a period of 20 years. This proposal the Council absolutely refuses to entertain.

During the past twelve months the Place de Carrousel has been lighted by electricity by the Société Lyonnaise. For this the city has paid the sum of 23,393 francs, but the Company finds that the cost of the lighting has amounted to 30,000 francs, and offers to continue for another year at that figure. The Prefect of the Seine has admitted the justice of the demands, and recommends the Council to vote the required sum in this year's budget.

In the month of October there will be opened in the Rue des Petits Hôtels a new and special school of design, to which has been given the official title of "Ecole d'Application des Beaux-Arts à l'Industrie." The instruction given will be entirely free, the principal subjects being free-hand and geometrical drawing, decorative design, painting and sculpture, and architectural drawing. Lectures also will be given on the history of art, with a special view to the elucidation and analysis of the various styles and schools of painting, architecture, &c. The building is to include three studios or workshops; one for ceramics, glass, and enamels, another for wood, ivory, and metal carving, and a third for wood-engraving, stuff designs, decorative panels, tapestry, and mosaics. The number of pupils will be limited to one hundred, and the entrance examination, open to every French subject of fifteen years of age, is to be made extremely severe, candidates being required to exhibit a good knowledge of the elements of all sciences and arts that are applied in the execution of ceramics, glass-work, wood and metal carving and engraving, furniture and stuff designs, and house decoration. The intention of the Paris Municipality in the organisation of this institution has thus evidently been to make it a sort of industrial art university, where those pupils who have shown special aptitude in the free drawing and science classes of the national schools may have an opportunity of completing their artistic and industrial education.

An institution of similar character to the above—the Ecole Speciale d'Architecture—has just applied to the Municipal Council for a free grant of land for the erection of its new buildings; the site desired being that formerly occupied on the Boulevard d'Enfer by the old horse market. The college was founded in 1865, and is devoted entirely to instruction in architecture. It comprises studios and lecture-rooms, exhibits the work of its pupils, and publishes the lectures and addresses of the professors, &c. There are many good scholarships in connection with the institution, which, moreover, holds examinations, confers degrees, and forms a centre for its former pupils and graduates in the course of their career. The period of study is fixed at three years, the professors number twenty-five, and no less than 420 pupils have already passed through the school. Such is the body that is now seeking to increase its accommodation and extend its operations with the object of becoming the *Alma Mater* of the profession.

From a report issued last week by the Minister of Public Works it appears that during the year 1882, 1,246 kilomètres of new lines were opened, making the total length of line now working in France 28,592 kilomètres. Of these, 22,282 kilomètres belong to the railway companies, 2,084 form the State system of lines, 1,921—though the property of the Government—are worked by the great companies, and 2,305 belong to local and private owners. These totals do not include the Algerian lines, which have a total length of 1,531 kilomètres.

At last Saturday's meeting of the Académie des Beaux-Arts M. Franklin of Brussels was elected to the vacant post of correspondent in the section of sculpture. The election to the two other corresponding places in the sections of painting and engraving was postponed until to-day (Saturday).

The Prix de Sèvres has been awarded to M. Chéret. In accordance with the conditions of the competition, the prize work becomes the property, and will be executed at the expense, of the State in the Sèvres manufactory. It will bear the artist's name, and he is bound to superintend its execution without further remuneration.

The French Government have just purchased from M. Malvilian, of Grasse, several oil paintings and panels by Fragonard.

The sum given for these valuable works is 400,000 francs, but the present owner will be allowed to keep them in his possession until his decease, on condition that the public be admitted to view the pictures on one day in each week.

At the present moment the garden of the Carnavalet Museum is encumbered with building materials destined for the erection of a new gallery along the Rue des Francs Bourgeois, parallel to that already existing on the opposite side. This gallery, which will complete the quadrangle, is destined for the reception of the municipal collection of views and plans of old Paris. The curious Nazareth arcade or portico will form the centre of the new buildings, and serve as entrance. Portions of the sculptures of this portico are much injured, and crumbling away bit by bit; it has, therefore, been determined to have them reproduced by competent artists, so that the originals may be removed to the interior of the Museum, where they will be safe from further deterioration. The Arcade de Nazareth, through which visitors pass, will thus be only a *fac-simile*; but the public will lose nothing thereby, for the restoration of this relic of the past will doubtless prove as great a success as that of the portion of the frontage of the old Hôtel des Drapiers, which formerly stood in the Rue des Déchargeurs. When removed to the Musée Carnavalet this façade was in a terribly mutilated state, but the work of MM. Félix Roguet, architect, and Ch. Gauthier, sculptor, has restored it to what it must have been when Charles Bruant had given it the finishing touches.

The Hôtel Carnavalet was built in 1580 by Pierre Lescot, the sculptural decorations being the work of the celebrated Jean Goujon. It then comprised only the main wing, which has been lately restored, and one-storey buildings on the other three sides of the quadrangle for offices, stables, &c. In 1660 Mansard added a storey and rebuilt the portion fronting the street, of which the original gateway was the only part preserved. This work was executed for Claude Boislevé, one of Fouquet's tax-farmers, and thus it is that notwithstanding the general symmetry of the internal decorations, the sculptures of the main building at the bottom of the quadrangle on entering, and those of the ground-floor of the side buildings, which are undoubtedly the work of great artists of the Renaissance period, may easily be distinguished from those in the other parts of the hotel, which date only from the reign of Louis XIV., and present no special merit. Madame de Sévigné inhabited the hotel for nearly twenty years—from 1677 until just before her death in 1696—and after passing through numerous hands it was finally acquired in 1866 by the city of Paris for the reception of its library and historical collections. The Hôtel Carnavalet is about the only example still existing in a good state in France of the private architecture and house decoration of the Renaissance.

THE ASHBURNHAM MANUSCRIPTS.

THE following remarkable communication respecting the origin of the Ashburnham collection of manuscripts is by M. Léopold Delisle, Director of the Bibliothèque Nationale, Paris, who gave it to the correspondent of the *Times* in Paris:—

Lord Ashburnham's collections, the acquisition of which for the British Museum is under consideration, comprise two series of manuscripts, the fate of which deeply interests French *savants*, because they consist, in large part, of documents relating to France. These are the manuscripts which the late Earl of Ashburnham bought of Libri in 1847 and of Barrois in 1849. A circumstance which adds to the anxiety of French *savants* is that many of the most important objects in the Libri and Barrois collections are manuscripts, or portions of manuscripts, which have been stolen from the public museums of Paris and the provinces, and which the librarians have always hoped to be able some day to restore to their collections. As regards the Barrois collection, the alarm was given in 1866. At that time I published a memoir, in which I endeavoured to show that upwards of sixty manuscript volumes, sold by Barrois to Lord Ashburnham in 1849, had been stolen from the Bibliothèque Royale, between the years 1840 and 1847. The evidence I adduced was accepted by the most competent persons, and even by the owner of the manuscripts.

Until recently, no attention was paid to Libri's manuscripts. The general opinion in France was that a great part of this amateur's collections was of very suspicious origin. It was more especially thought that he had stolen a large number of autograph letters; and the Bibliothèque Royale, the Institute, the Observatory, and the Carpentras Library were named as having furnished the chief portions of many of the collections of letters and papers preserved since 1847 at Ashburnham Place. It was also said that Libri had taken advantage of his function as Inspector-

General of Libraries to abstract valuable old manuscripts from the institutions which it was his duty to visit. These unpleasant rumours took a more positive form a few years ago. In 1868 the Earl of Ashburnham had published in a folio volume, got up with the greatest care, and from one of the Libri manuscripts, a very old Latin version of the Books of Numbers and Leviticus. Ten years later I ascertained that this manuscript of Libri consisted only of some sheets torn from an old volume of the Lyons Library. I even showed that the theft was comparatively recent, seeing that a German *savant*, Dr. Fleck, had seen the entire manuscript at Lyons as recently as about 1834. Lord Ashburnham very frankly acknowledged the fraudulent origin of his manuscript, and had the generosity to send it back to the town of Lyons. This was, unfortunately, an isolated fact.

The announcement of the offer recently made to the English Government of the Ashburnham Place collections has excited the curiosity of French *savants*, and the information given in the *Times* suggested to me the idea of inquiring into the origin of some of the Libri manuscripts, the value of which had been more particularly vaunted. The number of very ancient manuscripts comprised in the Libri collection, many of which rivalled the most exquisite of the kind possessed by the Vatican, had been dwelt upon. Everybody knows how rare these memorials are. There are no less than fourteen in the Libri collection, and many of the richest libraries in Europe could not supply so long a series. These fourteen manuscripts were the subject of a memoir which I read on Friday last at the Academy of Inscriptions. I strove therein to show that all these manuscripts, or at least thirteen of them, were stolen from the public libraries of France, six from Lyons, four from Tours, two from Orleans, and one from Troyes.

But it is not merely Libri's very old manuscripts the origin of which is suspected by French *savants*. A thorough examination of the catalogues has led to the discovery of many other thefts, notwithstanding the care taken to disfigure the stolen manuscripts, and to add notes, so as to make it appear as if the manuscripts came from Italy, not from France.

In a memoir respecting the Tours manuscripts now in the press, I have dealt with some 20 of Libri's manuscripts, which he must have stolen from Tours in 1842. Here are instances which will explain how I am able to demonstrate the fraudulent origin of the manuscripts. More than a century ago Brequigny examined, in St. Martin's Church, Tours, a ninth century manuscript containing 31 *opuscula* of St. Augustine and other Fathers. This manuscript passed at the Revolution into the Tours Town Library, and is there numbered 281; but the five last *opuscula* noticed by Brequigny in the St. Martin's manuscript are now missing in manuscript 281 of Tours. These five articles were—27, "*Exemplum Epistolæ Maximi Grammatici*;" 28, "*Epistola Sancti Augustini ad Maximum*;" 29, treatise without title, headed "*Hujus operis auctor ignoratur*," and beginning with the words "*Ut respondeam*;" 30, "*Hieronimi de Vitâ Pauli*;" 31, "*Ex Origenis Homeliis Excerpta*," with the signature of a certain Adalbaldu, to whom the manuscript had belonged in the time of Louis de Débonnaire. Now, according to a report of Dr. Zangemeister, manuscript 75 of the Libri collection consists of 13 sheets of parchment, on which are found in ninth century characters,—1, "*Exemplum Epistolæ Maximi Grammatici*;" 2, "*Augustinus ad Maximum*;" 3, treatise headed "*Hujus operis auctor ignoratur*," and beginning with the words "*Præcipis ut respondeam*;" 4, "*Hieronimus de Vitâ Pauli*;" 5, "*Hæc Origenes in suis Homeliis narrat*." At the end is a somewhat confused Italian note, which Zangemeister attributes to Libri.

From this comparison it is evident that the fourteen leaves have been torn out of Tours MS. 281, for the purpose of forming Libri's MS. 75; that Adalbaldu's signature has been effaced, and that an Italian note has been substituted. Here have been committed both theft and forgery.

A similar fraud has been perpetrated with another St. Martin's MS., now numbered 284, in the Tours Library. Three catalogues, drawn up respectively about 1700, in 1807, and in 1840, agree in stating that this volume of the Carolingian period consisted of seven different pieces; the last four of which were a Monastic Rule, a poem by St. Orient, the vision of Wettin, and extracts from St. Augustine. St. Orient's poem and Wettin's "*Vision*" have disappeared from Tours MS. 284. The sheets composing them have served to form Libri's MS. 73, which contains St. Orient's poem and Wettin's "*Vision*." It can scarcely be supposed, indeed, that in two different copies two such dissimilar pieces have been copied, one after the other, as St. Orient's poem and Wettin's "*Vision*."

The thefts committed at Orleans are not less easily detected than the Tours ones. Thus, Hänel formerly studied in the Orleans Library a 10th century MS., very curious for the history of Roman law. This MS., numbered 207, contained the following pieces:—Folio 2, "*Visio Sancti Pauli*;" folio 25, "*Computus Græcorum sive Latinorum*;" folio 27, "*Posterior Pars Breviarii*;" folio 98, "*Glossæ*;" folio 102, "*Breviarii Prior Pars*." The Orleans MS. 207 has disappeared. We discover it in the Libri collection, under number 84. According to Libri himself, indeed, his MS. 84 contains, "*Visio Sancti Pauli*," "*Computus*," and the "*Corpus Juris Romani*." The conjunction of such dissimilar pieces shows Libri's

MS. 84 to be the old Orleans MS. 207. To remove all doubt, I ask for a verification, which could easily be made. Hänel tells us that in the Orleans manuscript the *Computus* began on the back of a leaf, second column, line 9. In the 84th Libri manuscript, the *Computus* ought to begin on the back of a leaf, 9th line, second column.

In the verifications I am calling for, the mutilations and arrangements by which the thief tried to conceal his crime must, of course, be taken into account. Thus, I am not certain that the 174 leaves of the Orleans manuscript will be found in the condition described by Hänel; and I should not be surprised if the manuscript had been cut in two. Perhaps Libri's manuscripts 84 and 85 must be combined to restore the original manuscript in its entirety. Here is another example, also borrowed from Orleans:—The library has lost the manuscript formerly numbered 266, which, according to the catalogue printed in 1820, contained several treatises by Bede, especially the Book of the Times, and terminated with a letter from St. Isidore to Masso. Now, Dr. Zangemeister informs us that the Libri manuscript 90 contains "*Bedæ de Temporibus Liber*," and that it ends by "*Epistola Isidori ad Massonem*." I conclude from this that in No. 90 of the Libri collection we have, if not the whole, at least a part of the Orleans manuscript 266.

I have never seen one Libri manuscript, and the comparisons I make are solely based on descriptions, in some cases very summary. I am none the less persuaded that the correctness of my observations will be verified by the inspection and comparison of the volumes themselves. This is what has already occurred with some of the volumes of the Libri collection. I had asserted that No. 7 consisted of sheets torn from the Lyons Pentateuch. This became so evident that the Earl of Ashburnham considered himself morally bound to repair the mutilation to which one of the most valuable manuscripts in the French museums had been thus subjected. Last Friday I announced that the fragment of the Psalter, No. 5, Libri, praised by one of the correspondents of the *Times* as being comparable to the oldest which the Vatican can offer, must be composed of leaves abstracted from a Psalter preserved at Lyons, under No. 351. Since then an eminent palæographer in England, who has been able to compare the fragment of Libri's Psalter with a photographic facsimile of the Lyons Psalter, has not hesitated to assert that the identity of the two manuscripts is perfectly established.

The other verifications I propose will have, I feel confident, similar results. It is not only to save the purchaser from the inconvenience of being deceived as to the nature of the thing sold that it is of importance to ascertain the true origin of manuscripts which have been tampered with, as many of the volumes of the Libri and Barrois collections have been; the higher interests of learning demand that falsifications committed by the thieves to prevent the stolen volumes from being recognised should be rectified. Several mistakes have already been put in circulation by critics, who could not suspect the traps laid for their good faith by rogues who have misrepresented the proper form of the most valuable manuscripts; and who, by the aid of forged notes, have tried to pass off French relics as Italian. There is here a question of good faith which ought to be closely investigated, and the solution of which interests England as much as France.

THE ART SEASON.

A LECTURE was delivered last week by Mr. Henry Blackburn in the Literary Institute, Edinburgh, on "*The Art Season*." There was a good attendance. The lecturer, in his opening remarks, said he had seen the Exhibition in Edinburgh that afternoon, and the first thing that struck one there was the great number of pictures with which they were familiar in London. The exhibitions, however, of the Royal Academy and Grosvenor Gallery, and the collections in Manchester, Glasgow, Edinburgh, and other towns, gave no adequate ideas of the pictures produced, as the majority of painters, and certainly the most popular, painted numbers which the public never saw. Some of the very best painters had strong objections to exhibit at all. Mr. Brett, for example, who painted thirty-six pictures in a year, had seldom more than one on exhibition. After referring to the pictures of Alma Tadema and other well-known artists, the lecturer remarked that the constant reproduction demanded of those painters by the public gave greater opportunities to younger men. In the Edinburgh Exhibition he was struck with the fact that the best places were occupied, not by the works of younger men, but by pictures which had been exhibited before. There was, he thought, scarcely sufficient space or opportunity given to the younger artists. Referring to the paintings of Mr. Millais, Mr. Blackburn said there was nothing more charming than his studies of children in such pictures as *Cherry Ripe* and *Caller Herrin*. Millais had only to paint *Cherry Ripe*, and he coined 3,000 guineas, and by a rearrangement, and presenting the same face in *Caller Herrin*, he had 3,000 guineas more. Mr. Frith, the lecturer went on to mention, had in preparation a picture called *Society*, which would be exhibited next spring. There was almost

a fashion in the press to decry Mr. Frith; but, whatever might be said of his style, the execution was good and worthy of appreciation. If there were things, as in the *Derby Day*, which had been taken objection to, the artist only reflected the age in which he lived. He painted what he saw about him, and those about him were probably neither "Saints, heroes, nor wise men." In Scriptural subjects, they had generally the old scenes reproduced in a stereotyped way, and the truth might as well be told at once, that there were almost no Scriptural artists in this country at the present time. There was little encouragement to paint religious subjects just now. He was perfectly aware of such pictures as Sir Noel Paton's, but he would not criticise that gentleman's art, because, if such pictures gave comfort to any persons, he did not wish to disturb them, though he would not advise young artists to make that their aim. Doré was a man of great power and versatility; but he did not make people feel, as he (the lecturer) thought he did not feel himself, the subjects he painted. Like the old woman, however, who found great comfort in the word "Mesopotamia," some, no doubt, found the subjects painted by Doré soothing and comforting. In concluding, Mr. Blackburn urged the importance of throwing off affectation and mannerism in art, and letting one's style be independent and truly national. He had felt, he said, in looking at the pictures that day in the Exhibition, that there was a want of sincerity, and he also felt that a good many paintings did not get justice, not so much because they were badly hung as because of the impossibility of doing otherwise than placing them in juxtaposition to others.

ST. GEORGE'S CHURCH, GLASGOW.

A MEETING of the architectural section of the Philosophical Society of Glasgow was held on Monday evening. Mr. James Sellars, president of the section, occupied the chair.

Mr. John Honeyman, F.R.I.B.A., read a paper on the proposed removal of St. George's Parish Church. He said that although the negotiations between the Town Council and the Presbytery had gone on so far smoothly, there had been some indications that the proposed destruction of the building was not likely to be quietly acquiesced in by the citizens. He desired to say a word on behalf of the threatened steeple, because he did not doubt that, if the members of the society agreed with him in thinking it worth preserving, the public expression of their views would bear considerable weight with the authorities. He did not think that there was any architect in Glasgow who would wish to see the steeple removed. However much they might differ as to its intrinsic merits as a work of art, the following reasons seemed to him to be quite sufficient to forbid its destruction:—First, it was about the best thing of the kind they had within the municipal boundaries, and therefore they could not spare it. In the second place, it added greatly to the beauty of a considerable part of the city, and grouped picturesquely with other buildings; and when the new municipal buildings were completed, its value in this way would be greatly increased. In the third place, although not an ancient building, it had a certain historical value, and, apart from that, marked one stage in the city's triumphant westward march. Then, again, it was not without interest as a specimen of the architectural art of the period in which it was built, and as illustrating one of the phases of our ever-changing fashions. While little could be said in favour of the removal of the steeple, it was possible nothing could be said against the removal of the church. The Town Council and Presbytery seemed to be agreed as to the expediency of its removal, and no doubt they were influenced a great deal by the consideration that they could get 30,000*l.* for the site. If the whole of the site were to be left clear, as was proposed by one Town Councillor, the sum that that would cost would be about 50,000*l.*—30,000*l.* for the ground and 20,000*l.* to erect a new church elsewhere. Now, not a single soul in Glasgow would be benefited by the expenditure of that money, except the proprietors having frontages to the square. It was utterly absurd to say that the building interfered with the traffic. As a matter of fact there was twice as much clear breadth of roadway as at Temple Bar, London, with its ceaseless fourfold traffic. Then it could not for a moment be contended that the clearance would affect the public health, and it was entirely a matter of opinion whether George Street would be in any way improved after the removal of the church. For his own part, he was inclined to think it would not. The effect of removing another threatened church—St. Enoch's—would be entirely different, as it would open up a fine vista across the Clyde. Nothing of a similar character would be the result of the removal of St. George's Church. If the Town Council felt that they had some money to spare, he had to suggest that they should demolish St. George's—retaining the spire—and erect in its place a somewhat smaller building, beautiful without and within. If that were done, it would perhaps not be found that the locality was unsuitable for gathering together a flourishing congregation. Whatever was done, however, he had to say, do not take down the steeple, and don't leave the remainder of the site vacant, but sell it.

Mr. David Thomson said he was opposed to the removal of the steeple; but Mr. Honeyman had not mentioned the difficulties

under which the corporation at present laboured in being proprietors of a church which, owing to its position, it had been found difficult to retain as a useful public institution. In these circumstances it seemed a very reasonable thing to desire to have the church removed to a place where it would be more convenient for the congregation.

Mr. Landless did not think there was a more beautiful tower in the city than that of St. George's. The body of the building would never be missed if it were removed, and it was possible, if the tower were left, to erect a structure that would harmonise very well with it.

Mr. Watson thought that the tower bore the same relation to Glasgow that the Scott Monument did to Edinburgh. It was one of the most conspicuous objects in the streets, and the removal of it would be an irreparable loss for the small balance. If the principle that the Town Council seemed to be following were carried to its legitimate conclusion elsewhere he did not see why there should be any objection to taking down St. Paul's or Westminster Abbey in London, or any great public building that might be described as an obstruction.

Mr. Bromhead said that while he was not at one with those architects who talked about the beauty of St. George's spire, he would not like to see it removed.

Mr. Gildard and Mr. Howitt also took part in the discussion.

A vote of thanks was accorded to Mr. Honeyman for his paper.

Mr. T. L. Watson, architect, afterwards submitted a paper on "Square-dressed Rubble," his remarks being illustrated by a series of diagrams.

ST. ANDREW'S TOWER, PEEBLES.

DR. WILLIAM CHAMBERS, of Edinburgh, is about to add another to his many public services, by restoring an interesting piece of Norman architecture that has long stood in a dilapidated condition on the banks of the Tweed, near Peebles. The relic in question, says the *Scotsman*, is a tower that once formed part of the Church of St. Andrew, an edifice dating from the end of the twelfth century. It is situated within the jurisdiction of the heritors of Peebles, who readily assented to Dr. Chambers' project for the preservation of an object he had known from boyhood. The carrying out of the work thus piously undertaken has been entrusted to Mr. W. Hay, architect, Edinburgh, whose name has been so honourably associated with the restoration of St. Giles' Cathedral, and under his direction operations will shortly be commenced. The Church of St. Andrew, it may be mentioned, was in use till the Reformation, when its handsome endowments were seized, with the result that the building soon afterwards was left to go to wreck. Latterly its remains have been known as a ruin in the centre of the churchyard, where tourists may admire the enormous strength of walls that have so long resisted the effects of wind and weather. Its outer aspect is that of a square mass, totally devoid of any picturesque feature. Its general height is 45 feet, and its walls 3½ feet thick, the windows being only apertures, and the top roofless. The interior, so far as can be learned, consists of vaults, some of which have been made use of by the local gravedigger. By way of preliminary to his operations, Dr. Chambers thought it advisable to have a lithograph made of the tower. This has been executed by Messrs. W. & A. K. Johnston, from a drawing furnished by the architect, and will be found interesting for future reference. In the process of restoration the structure will undergo an almost complete renewal of its interior. The most conspicuous alteration to be made is that, instead of being left open to the weather as at present, the tower will be covered with an appropriate Norman roof, consisting of slate or stone slabs, sloping from the centre in two opposite directions, with crow-stepped gables, and resting upon a corbelled cornice. This will add 10 or 12 feet to the height of the building. The apertures in the sides are to be filled in with small windows of plate-glass. The vaulted interior floors will be superseded by strong wooden or stone ones, connected by means of a stone staircase. The doorway in the east side is to be renewed in a handsome style; while commodious stone seats will, for the first time, be placed outside for general accommodation. It is no part of Dr. Chambers' plan to make any material alteration on the exterior of the structure. It is too valuable as a relic of ancient art to be ruthlessly destroyed or interfered with; and beyond the levelling of the upper part of the wall, and the adding of two or three courses of masonry, which will be very carefully executed in old style, the fabric will remain very much as it now stands. Great care will be taken to have the whole pointed afresh, after a method corresponding with ancient styles of working. In carrying out the task assigned him, Mr. Hay, we believe, will have the assistance of workmen who have gained useful experience in connection with the restoration of St. Giles' Cathedral. When the operations shall have been finished, as they are expected to be in the course of the summer, the tower will be restored to the heritors, who will then take charge of its management in the public interest.

Mr. Jowett Kendall has been appointed architect for the new Board Schools to be erected at Thackley, Idle, Yorkshire.

NOTES AND COMMENTS.

THE new site for the Museum and Public Library in Dublin has been sanctioned by the Treasury. Communications are in progress between their Lordships and the Commissioners of Public Works with the view of obtaining more plans and descriptions of the property, which will be required. "Their Lordships are also making arrangements for a fresh open competition for the designs of the buildings to be erected on the extended site." The conditions have yet to be made known. We understand that hitherto there has been no communication with the five architects who took part in the second competition. It will be difficult to compensate them for their loss, and it is to be hoped that the Government will act liberally. The question will arise, to what department is the loss arising from the fiasco to be debited? is it to be the Treasury, the Science and Art Department, or the Irish Office of Public Works? There will be a desire in every one of those departments to be free from an expenditure that represents nothing, and in the struggle the architects are likely to be the victims. It is said that the matter is at present in the hands of the official lawyers, in order to discover some means by which the plans, as well as the Government guarantee, may be set aside.

MR. ROBERT COLLINSON, who was for many years one of the masters in the Training School at South Kensington, proposes that the collection of paintings by the late DANTE ROSSETTI, which are now on view in the Burlington Fine Arts Club and in Burlington House, should be seen together. "They are now," he says, "seen under many disadvantages and at the worst period of the year, when the days are shortest and darkest, before the provincial artists usually come to town, and when those here are too occupied with their own works to give them the attention they demand. To art students these pictures are a most valuable lesson as examples of magnificent colour, draughtsmanship, and design, and for the deep earnestness and poetic inspiration pervading them all. Had ROSSETTI been a contributor to the annual exhibitions of either the Academy or the Grosvenor, this suggestion would be less called for; but his works are now presented to the public for the first and, probably, the last time; and in the short time that the two exhibitions remain open it is impossible that the full benefit can be derived from them, or that a fair and unprejudiced verdict can be given." The suggestion is a good one, but it would be necessary for a committee to be formed to make arrangements, which might be a difficulty.

MUCH amazement has been excited by the statement of M. DELISLE, who asserts that the Ashburnham collection of manuscripts was in a great measure derived from the public libraries of France, or, in other words, that stolen manuscripts had been purchased. It is alleged, too, that the manuscripts were taken by a man who held a very high official position. Although a week has elapsed since the charge was made, it is strange that the representatives of M. LIBRI have been silent. It is easy to throw blame on a man who is no longer living, and it is quite possible that papers may exist to explain the circumstances under which M. LIBRI obtained his manuscripts. It often happens that manuscripts are imperfect, and as few people are competent to collate them the defects are generally unknown. The corresponding parts may exist elsewhere, awaiting discovery by keen-eyed hunters, such as M. LIBRI undoubtedly was. An investigation of his papers and letters, if any remain, might show that the charges against M. LIBRI cannot be supported by sufficient evidence.

In the *Magazine of Art* for March there is an article on "SHERATON'S Furniture," and an engraving is given of a SHERATON frieze, which is supposed to be "entirely original" in its treatment. "The curves," it is said, "are full of grace and vigour, and the combination of form both beautiful and ingenious. It was intended, no doubt, to be executed in inlaid woods, the shading and drawing being supplied by slightly incised lines, which assume a black colour when the surface is polished." All this appears to be clear and definite; but, if the writer were possessed of even a slight knowledge of the history of ornament, he could not have written the passage. The frieze is simply a "bit" by SALEMBIER, and the elliptic curves and tendrils which grow out of the main lines are quite characteristic of his style. The original design was reproduced from

one of the artist's etchings in *The Architect* in July 1878. This is not the only example that could be cited of the effrontery of SHERATON in passing off other men's work as his own. He stole from French designers without scruple, calculating, we suppose, on the ignorance of what was done abroad which prevailed in his time.

THE *Central-Blatt der Bauverwaltung* describes a special composition manufactured at Stargard, in Pomerania, which has been successfully used for some years on the railway from Berlin to Stettin for wall-copings, and generally in cases where a waterproof plaster is required. The substance is composed of coal-tar, clay, asphalt, resin, litharge, and sand. In fact, it is a kind of artificial asphalt, with this difference, that it is applied cold like cement. When well laid on it has great tenacity, and stands well through all changes of the weather. In applying this cement, the part to be covered is thoroughly dried, and then brushed over with a coat of hot tar varnish. The cement is laid on with a trowel, in a layer about half an inch thick. If the surface to be covered is large, a second coat of tar varnish is applied, over which coarse sand is thrown. In this way a cheap coating is obtained which is affected neither by rain nor frost, and which lasts for an indefinite period.

ANOTHER material has been introduced in Glasgow which is supposed to be able to withstand fire without being consumed. It is called "asbestos millboard," and it is intended to be used for lining walls or ceilings. The sheets are about 40 inches square, and it was found that when only the eighth of an inch in thickness the asbestos millboard was able to resist a fierce fire for a quarter of an hour. On examination the backs of the sheets were found to be without stain. The experiment was witnessed by several official people, including the inspector of fires in Glasgow.

A NEW kind of exhibition is to be held in Boston, U.S., in September. American products will be excluded, and the seven acres of floor space which is in the building will be devoted to the works of foreign exhibitors. Another peculiarity is that the space will be assigned without cost, and the goods will be allowed to remain in bond free of duty while on exhibition. At the close they may be sold upon payment of the duty. The exhibition is being organised by a corporation, and the secretary, in his circular to American consuls, says: "The advantages of such an exhibition to foreign manufacturers and others who may exhibit must be apparent, while there can be no question as to the interest which it will awaken in the United States. This country has had no opportunity since the Centennial Exhibition, held over six years ago, to see the recent advances of foreign art and industry. The National Government of the United States has manifested its interest in the enterprise by legislation, which will greatly facilitate the work of all interested, and will especially lighten the expense to exhibitors." The exhibition building has cost over half a million of dollars, and steam power, gas, and water will be available for use.

It is expected that the colossal East River Suspension Bridge, which is to unite New York and Brooklyn, will be opened before summer. The bridge has been in hands since 1867, and will cost about fifteen millions of dollars. The towers upon which the suspending cables rest are situated immediately at the two shores, and form a span of 1,595 feet, which is 50 per cent. greater than any heretofore attempted. The faces of the anchorages which hold the ends of the cables are about 930 feet from the centres of the towers. The bridge, therefore, has three spans in a distance of 3,460 feet: including the approaches it is nearly 6,000 feet long. The height of the towers above high water is 283 feet, or 346 feet and 312½ feet above their foundations respectively, which latter measure 170 feet long by 102 feet wide. The anchorages are 89 feet high, 129 feet long, and 110 feet wide at the base. The masonry in the towers measures 85,000 cubic yards, and in the anchorages 66,000 cubic yards. The roadway is 85 feet wide, and is supported by four cables, each of which is 15½ inches in diameter, and contains 5,434 wires, measuring in the four cables 14,060 miles. The wire in the four cables is of steel, and weighs nearly 3,500 tons. The permanent weight of the river span is 6,740 tons; the greatest transitory load is estimated at 1,380 tons, making the total weight of the loaded span 8,120 tons.

BRAMFIELD HOUSE.

BRAMFIELD HOUSE, the country seat of Miss TATLOCK, lies about three miles due north of the picturesque East Suffolk village of Yoxford. The mansion occupies the site of the old house (which was entirely pulled down), though on greatly extended lines. It stands well back from the road, and the park contains some fine specimens of old oaks. Extensive views of the surrounding country are to be obtained from the upper windows, the vessels being plainly visible off Aldborough on a clear day, with the old towers of Blythburgh and Walberswick in the foreground.

The house was commenced in 1879, and has only just been decorated and finished. The principal front faces the north, the entrance being through an open timber porch leading into a mosaic-paved vestibule, which admits the visitor through oak swing-doors into the grand hall. The extreme interior dimensions of the hall are 48 feet by 27 feet, with a proportionate height. The ceiling is divided into panels by oak beams, and the floor is of parquet. Archways with fluted pilasters and panelled soffits lead to the garden porch, lavatories, &c. In this hall is placed the principal stairs, which are of wainscot, 6 feet wide, in three flights, divided by broad landings. An oak and walnut dado runs round the hall, up the stairs, and round the principal landing. The warming is by a powerful Musgrave stove, placed in a tiled recess, with oak chimney-piece and over-mantel. Around the grand hall are grouped the principal rooms, library, drawing-room, morning-room, and dining-room, the aspect of these rooms being west, south, and east. The dining and drawing rooms are each 30 feet by 19 feet. The drawing-room has an elaborate and beautiful parquet floor, and the dining-room a costly dado, chimney-piece, and other fittings in oak and pollard oak. The walls of the hall and dining-room are painted, the former in terra-cotta, and the latter a very effective shade of blue, with an oak picture rail and artistic frieze in either case. On the first floor is a spacious landing, with parquet floor and oak panelled ceiling, five suites of bedrooms, bath-rooms, and other accessories. Servants' bedrooms are placed on the attic, but this floor does not extend over any of the principal bedrooms. There are spacious kitchens, cellars, and other servants' offices and outbuildings. The house stands on a terrace, and is built entirely of local red bricks, specially made for the purpose, and of beautiful colour, with moulded strings and window-sills, and ornamental brick panels, and the roof is covered with Broseley tiles. Relief is also obtained by timber-work and rough-cast plaster, and special attention was paid to the grouping.

The whole of the above work, including special fittings throughout, and furniture in the dining-room, has been carried out from the designs and under the superintendence of the architect, Mr. E. F. BISSHOPP, of Ipswich; the builder was Mr. ROBERT GIRLING, of Ipswich, and he has executed the work in an admirable manner.

STUDIES BY M. LOUIS LELOIR.

BY the courtesy of M. LOUIS LELOIR we were able to reproduce lately some of his designs for an illustrated edition of MOLIÈRE'S comedies, and this week we give two others of the series. The first is from the comedy-ballet or spectacle "Les Amants Magnifiques." It represents the scene in the fourth act where VENUS appears to the two Greek princesses, mother and daughter, at a time when they were talking about certain proposals of marriage. If the reader will turn to the old English translation of the comedies which was "printed by and for JOHN WATT at the Printing Office in Wild Court, near Fleet Street," an edition which still remains the best in our language, he will find that the same subject was taken by no less an artist than BOUCHER, who with COYPEL, HOGARTH, and other artists of note furnished the designs for the illustrations. No subject was better adapted for BOUCHER, but his greatest admirer must allow that his design is not equal to M. LELOIR'S. The stage direction is more faithfully followed, for in BOUCHER'S engraving we have "VENUS accompagnée de quatre amours dans une machine." But the princesses, who are surrounded by the fortifications of whalebone and silk devised by the milliners of that day, show little surprise, and stand as if they were the equals or superiors of the goddess. It would perhaps be difficult for them in such

a costume to do otherwise. In the etching of the scene by M. LALAUZE, which appears in the splendid edition of MOLIÈRE, which was lately published in Edinburgh, the princesses are also represented as standing, but they wear a Greek dress. M. LELOIR'S arrangement is better: the women were more likely to kneel than to stand in the presence of VENUS. The attitude of the goddess is also more pleasing, although less formal, than that of the figure in BOUCHER'S print.

The subject of the "Magnificent Lovers" was devised by the illustrious LOUIS XIV. himself, and his Majesty actually danced or pantomimed the part of NEPTUNE in the first interlude, and the part of APOLLO in the sixth. It was probably modesty which prevented so renowned a warrior from appearing as MARS. However graceful or agile he may have been as a ballet dancer, the story does not indicate that King LOUIS was gifted with dramatic inspiration. Two Greek princes are in the play represented as rivals for the hand of a princess, but instead of fighting to decide who was to win her, they resolve to compete as if they were theatrical managers, and the happy man is to be the producer of the best series of entertainments or *fêtes galantes*. But the mother of the princess is in favour of one of the suitors, and in order to overcome her opposition his rival obtains the aid of an astrologer, who is a skilful stage mechanist, and when the princesses are together a machine descends containing a woman who is supposed to be VENUS. She addresses the mother in rhyme, and says the daughter is to be given to the man who saves the mother's life. But the trick does not succeed, for in the end a worthy soldier carries off the prize. MOLIÈRE thought little of the play, which was merely intended to give an opportunity for scenic display; but the author of "L'Amour Médecin" and the "Malade Imaginaire" is discernible in some capital satire against judicial astrology, which had its dupes in those days. If the lovers were not magnificent, the expenses might well be so called. LOUIS XIV. was right royal in his way of spending the money which was raised by taxing his people. The success of the comedy-ballet depended on the ingenuity of the machinery, and VIGARINI, to whom the stage carpentry was entrusted, charged 27,092 livres for his work. MOLIÈRE'S troupe of Comédiens du Roi cost 16,000 livres for the first day's performance. The piece was afterwards represented in a more economical style for the gratification of the Duke of BUCKINGHAM, and since that time it has not been revived. It is a strange fate for a pageant which, according to the chronicles of the seventeenth century, surpassed the Olympic games and other festivals of the Greeks, while it demonstrated that LOUIS QUATORZE was as great in the arts of peace as in war.

The second illustration is from "Don Garcia de Navarre, ou, le Prince Jaloux," another of MOLIÈRE'S plays which has not been able to retain a place on the French stage. It was also a departure from his ordinary and natural style, for it was considered to be an experiment in the *comédie héroïque* of Spain. MOLIÈRE himself played DON GARCIA, and wore a Spanish dress, breeches, cloth cloak, satin doublet—all embroidered; but although he was a clever comedian the comedy met with so little success that he did not venture to print it. Passages from it were utilised in some of the other comedies, and especially in the "Misanthrope." The DON is a Prince of Navarre, and is in love with ELVIRA, Princess of Leon; but he is absurdly jealous, and is perpetually tortured by trifles light as air. In the scene which forms the subject of the illustration he is represented as finding the fragment of a letter written by ELVIRA, which of course he interprets wrongly, and, on her entry, upbraids her with deceiving him. DON GARCIA'S jealousy has nothing of the comicality seen in "Sganarelle;" and as MOLIÈRE always failed when he attempted to be tragic or pathetic, it is without the grandeur of "Othello." It is no wonder the Spanish prince was in that age considered to be a bore.

It may be said without exaggeration that M. LOUIS LELOIR knows more about the seventeenth century than of the nineteenth, and a glance at the collections in his studio would show this, and it is more evident when his paintings are studied. It was a happy thought which inspired the publishers of a new edition of the comedies to invoke the aid of a man thus gifted, and who is, moreover, the first water-colour artist in France. The old Academy inscription declared that "nothing was wanting to the glory of MOLIÈRE," and it is still true; but when the beauty of all M. LOUIS LELOIR'S illustrations is considered, it cannot be denied that they give to the great dramatist's works a new value.

THE LONDON SANITARY ASSOCIATION.

THE second annual general meeting of the members of the London Sanitary Protection Association was held on Saturday afternoon at the rooms of the Society of Arts, Adelphi, under the presidency of Professor Huxley. From the report of the Council presented to the meeting it appeared that 368 new members had joined the Association during the year, and there was a total of 533 members. The total number of houses inspected was 362, and in the greater number of these serious errors in the sanitary arrangements of the houses were found and corrected. Twenty-one of them, or 6 per cent., were found to have the drains choked up and no communication whatever with the sewer, all the foul matter sent down the sinks and soil-pipes simply soaking into the ground under the basement of the houses. In 117 houses, or 32 per cent., the soil-pipes were found to be leaky, allowing sewer gas, and in many cases liquid sewage, to escape into the house. In 137, or 37 per cent., the overflow-pipes from the cisterns were led direct into the drains or soil-pipes, allowing sewer gas to pass up them and contaminate the water in the cisterns, and in most cases to pass freely into the house. In 263, or nearly three-fourths of the houses inspected, the waste-pipes from baths and sinks were found to be led direct into the drain or soil-pipes, thus allowing the possibility of sewer gas passing up them, instead of being led outside the house and made to discharge over trapped gullies in the open air, as they should be. Professor Huxley moved the adoption of the report, and stated that he had found himself unable longer to act as president of the Association, owing to the increasing demands upon his time and energies. He was glad, however, to say that the Duke of Argyll had consented to succeed him in that post. Lord Chelmsford remarked that it was extremely painful to think how much sadness and misery had been and might be caused by the want of sanitary arrangements in the habitations of the people. When an Association like that came forward to do the work, and to do it gratuitously, with men on the Council like those they had, he thought it would be wrong for the proceedings to terminate without thanks being most warmly expressed to Professor Huxley and the Council for their labours in the cause of sanitation and for the welfare of the inhabitants of the metropolis. He should have great pleasure, therefore, in formally moving a vote of thanks. Dr. Norman Kerr seconded the motion, which was unanimously carried, and Professor Huxley having briefly thanked the meeting for the vote, the proceedings terminated.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the last meeting of the Edinburgh Architectural Association, Mr. Thomas Henderson presiding, the Rev. Dr. Cameron Lees read a paper, entitled, "A Few Notes on Paisley Abbey," in which he gave a brief sketch of its history, referring the members of the Association to his work upon the subject for details. After tracing the fortunes of the convent from the settlement of a band of English monks from Wenlock in Shropshire, under the patronage of the Stewart of Scotland, till its dissolution at the Reformation, noticing its various benefactors, and the part the different abbots took in its architecture and adornment, Dr. Lees went on to refer to its reconstruction after the War of Independence, and to the exertions of Abbots Tervas, Crichton, George and Robert Shaw. The first-named abbot, he said, built the clerestory and triforium, the second adorned it with sculptures, the third built the conventional buildings, and the last effected the endowment of various altars within the church. Dr. Lees had found in the rental book of the Abbey, which he discovered in the Advocates' Library, the name of the sculptor—Thomas Hector—who carved the grotesque figures of the triforium. Hector received a piece of land from the abbot on condition of holding his chisel at the disposal of the convent. Another name that had come down to us as connected with the rebuilding of the Abbey was John Murdow or Morrowe, a Frenchman. After Bannockburn, the Scotch naturally turned to France for architectural help, and Dr. Lees believed French influence was distinctly traceable in the building. Incidentally noticing how one of the abbots raised funds for the work by obtaining from the king the right to sell wine within the Abbey, which became a place of entertainment to the thirsty souls of the neighbourhood, Dr. Lees remarked that it was almost as curious a way of raising the wind for church purposes as the bazaars, lotteries, and fancy fairs of the present day. After giving a rapid sketch of the dissolution of the monastery, and calling attention to the fact that the people of Paisley—who, he said, in those days were more Conservative than they are now—remained Catholic long after most of Scotland had conformed to the new religious views, Dr. Lees described in some detail the noticeable features of the architecture of the Abbey, and what had been done towards its restoration, remarking that in 1859, when he was inducted to the second charge, a more dreary place of worship it was impossible to conceive. It was like a charnel house. The burial-ground outside reached above the sill of the windows. The floor was earthen, and you were afraid if you stirred your foot you would rake up some old bones which lay uncomfortably near the surface. The building was

altogether in a most wretched state. His (Dr. Lees') energetic colleague, Mr. Wilson—a man to be held in remembrance by all who had any regard for the place—with a committee, of which he (Dr. Lees) was an humble member, set themselves to the restoration of the church. From that time to the day of his (Dr. Lees') leaving Paisley, five years ago, he saw many, many thousands of pounds spent in the restoration and improvement of the building. The work was done, he thought, tolerably well, and it would have been better done if they had had more money. Since he left Paisley he was glad to hear that what was called the "Sounding Aisle" had been cleared out by the Duke of Abercorn—not, indeed, before it was needed. Dr. Lees, in closing, said that the Abbey could all be restored with less difficulty than many other buildings which had been repaired. He hoped Paisley would find a Dr. Chambers who would take it in hand. He (Dr. Lees) had seen it stated in a paper that sectarian feeling retarded its restoration. He could not believe this of his old townsmen, who, he remembered, came so generously forward to help former endeavours. The fact that for an hour or two in one day in the week it was occupied by a congregation as a place of worship ought not to hinder the restoration of an historic building such as this, in which people of all religions were interested. The Abbey was the source whence Paisley derived its existence. He trusted that the noble munificence which had built museums and town hall and observatory would yet flow towards the old building, the great glory of the place; and that hands, which in Paisley were always quick to do good and always open, would yet raise its ruined walls and build its broken frame. On the motion of the chairman, a vote of thanks was awarded to Dr. Lees for his interesting lecture.

MR. WATERHOUSE, A.R.A., ON THE STUDY OF ARCHITECTURE.

THE annual meeting of the Birmingham Society of Arts and School of Design was held on February 22, when the prizes were distributed to the students. Mr. Waterhouse, the president for the year, was expected to attend, but owing to illness he was prevented. His address was, however, sent, and it was read by Mr. J. H. Chamberlain.

Mr. Waterhouse said that architecture differed from the other fine arts in this—that it resulted from the anxiety to clothe our practical necessities with such beauty as they were capable of receiving, and we of imparting; whereas the other arts, painting and sculpture, except when they had to do with portraiture, were the embodiment of the artist's aspirations, without reference to utility in the first place. When he was a boy, the earnest character of the mediæval revival and the teaching of Pugin, Scott, and, above all, of Ruskin, carried away all enthusiasts, himself among the number. Directly his pupilage was over he was off to North Italy, to dwell for a time among those marvels in marble, stone, and brick which had been so irresistibly commended in the "Seven Lamps of Architecture" and the "Stones of Venice." When commencing practice, his buildings, like those of the young architects at that time, were affected by the influence which the Romanesque and Pointed architecture of Italy could not fail to exercise on those who studied it. They hoped that the Gothic revival would be more than a mere revival—that it would turn from a revival into a growth, that they would shortly see the spirit and the requirements of the nineteenth century embodied in the dress of the twelfth and thirteenth centuries. But when, as it appeared, they were on the eve of this much-to-be-desired consummation, fickle Fashion declared herself tired of mediævalism. She called for something else and got it, and had it still in what she was pleased to call the style of Queen Anne. That style undoubtedly had its picturesque merits, and pleased mightily for the moment; but Fashion would some day tire of it, and expect some fresh architectural excitement from a past more or less remote. How was this eternal change from the revival of one defunct style to that of another to end? And how was any real progress to be made whilst such archæological imitations were in vogue? As educated people it was essential that we should study the past, but in doing so it was well to beware of the special dangers of the pursuit. The habit of mind which would make a man a good imitator or restorer of ancient architecture would to a large extent unfit him to become the successful originator of buildings having a distinctive character of their own. There were some men, thinking men, who considered it the function of to-day to imitate. They said such imitation might keep alive a knowledge of the forms, if not of the spirit, of past art. He confessed he rather sympathised with the words of a brother architect, Mr. E. R. Robson, who thought we ought to set our faces against unblushing copyism. In designing things of household use, in glass, silver, and other materials, it was well that we should study carefully the way in which such objects were treated by the greatest artists in the past; and South Kensington nobly aided us in such researches. Let us try to discover the secret of the charm of their works. When we had ascertained this, and understood why so simple a form and so delicate and unostentatious an ornament gave more satisfaction than another shape much more elaborate in itself and in its ornamentation, we

should be in a better position to do some original and excellent work for ourselves than we should be by merely reproducing thoughtlessly any number of Benvenuto Cellini or Greek vases. Let them specially shun the reproduction of the form of objects applied to totally different uses, and made in entirely different materials. Such manufacture had nothing to do with art, and displayed great poverty of invention and perverted taste. Our silversmiths' work was by no means free from it. It was bad enough to see honey served in a silver hive, but what ought to be said of a butter-dish covered by a silver straw hat? Such ignoble work saved what most people were afraid of spending—earnest thought on their work; but he was sure of better things from the students of the Birmingham School of Art. Even nature must be resorted to with a judgment cultivated by observation of the best work, as its direct imitation in architecture and some other arts was, he was persuaded, for the most part, a great mistake. One never saw it in Greek work, and one ought not to see it, he believed, in Birmingham work. There was a noble field for the display of any amount of artistic power in silversmiths' and goldsmiths' work, and he could wish the school whose members he was addressing no more captivating pursuit than the raising of this art to the height it attained in former ages by proportion, subtlety of curve, by the happy application of conventional ornament (not by its mere redundancy), by avoiding all direct imitation of nature, and still more emphatically of manufactured articles. If in designing a piece of presentation plate for a cricketer it was essential to adorn it with silver bats, balls, and wickets, the task would be almost a hopeless one, unless the ingredients were so arranged as to make conventional ornament of them. Returning to the special subject of his address, Mr. Waterhouse went on to speak of the deficient training of the English architect, and the necessity of studying how to make our buildings effective even under a gloomy sky. To secure that end architects must make much of the sky line. They should be particular to throw their design into perspective from the various points from which it was likely to be seen, and then to shade over in monotone the building so thrown into perspective, to see that their composition would be satisfactory when silhouetted against the sky. The efforts of the most fertile imagination in detail were thrown away without the connivance of the sun. In England we must trust to his direct rays, and so reserve the best surface work for the south and west sides of our buildings. It too often happened that the site for an important public building, which it was the desire of its promoters to make as great a success as possible, was adopted before its architect was appointed, and that its principal aspect was a sunless one. In such a case nothing was left to the architect but to make the best of it. If his style and the purpose of the building admitted of a varied sky line with gables, dormer windows, high-pitched roofs, massive chimney-stacks, and other exceptional features, any money he had to spend after satisfying the bare necessities of the case would probably be better spent in such features than in mere surface decoration. We had, he feared, shut out the glorious sun well nigh entirely from our daily lives, and we rested supinely under the gloomy pall by which the smoke demon obscured him from our view. But were we right in so doing? Was it too much to hope that a time might come when every philanthropist in this district who made smoke would also consume it, and the sulphur with it too? It was generally supposed that possession of the fee-simple of a piece of land enabled the owner to do pretty much as he liked with it. He looked for the time when people would view their property in a different light, and be willing, it might be, even to deny themselves in a money point of view to enable their neighbours to enjoy blue sky and flowery meadow a little longer. When he called attention for a moment to a solitary glen in the Lake District, running up from its most attractive lake into the heart of its grandest mountains, they would know that he referred to Borrowdale, which was now threatened by a railway with all its concomitant vulgarities, its dreary lines of débris, ugly embankments, and flat girder bridges. One voice at least from Birmingham he had been glad to hear raised against the desecration. He hoped there would be many yet before it was too late, and the seclusion of Borrowdale lost to the many dwellers in cities who were also ardent lovers of nature, and who would rather even walk on for the five or six miles along the loveliest of roads than have the end and aim of their pilgrimage polluted by the railway and all that it brought with it. It was said that this Borrowdale railway was not for the tourist at all: it was only to bring down the slate more readily to market. Architects would be the last people in the world to object to Cumberland slate coming easily into the market; but fond as they were of it, he would rather not use it at all than have it at such a terrible price as any loss of the attractions of Borrowdale. Returning nearer home, how often did they see a lovely garden surrounded by a lofty wall? The owner built that wall perhaps not so much selfishly as thoughtlessly. Had he reflected on what he was depriving others of he would very likely have built his wall some feet less high, and so let light and beauty still linger over the road which, alas! owing to his exertions, had now become undeniably dismal to those who had to traverse it. After speaking of the pleasure it gave him to see what was called the finest site in Europe—Trafalgar Square—with its row of plane trees at length around it, Mr. Waterhouse proceeded to deal with the notion that we were distanced by the

foreigner in the race whenever art was in question. It was said that the great advantage of this and kindred institutions was that they would give us the power to distance him in return. Now he ventured to think that this was a mistaken view of the case; they must care for art for its own sake. Other things might incidentally flow from affection for art, but it was beginning at the wrong end—an end which would assuredly result in failure if art studies were approached merely from a money-making point of view. South Kensington was a grand institution, of which all might be proud. She had conferred innumerable benefits, but he wished she would confer one benefit more, by founding a gallery of casts of all the best sculpture which the world still possessed, arranged chronologically, with information as to the name of the sculptor and date of the work, when attainable; where the original was found; where it actually was at present; and, finally, at what cost anybody who desired it might obtain a plaster copy of any particular work. Architects would rejoice to have the facilities such a gallery would afford of decorating the interior of buildings, where original sculpture could not be afforded, by the reproduction of the masterpieces of antiquity placed in situations expressly prepared for them. Sculpture lost much of its impressiveness by wrong placing. Mr. Waterhouse went on to say that there was a material which was admirably fitted, from its peculiar smoke-resisting qualities, for use in the architecture of our great cities in the present day, when we found all our best building-stone more or less yielding to the acids which were generated with the smoke which environed us. He meant, of course, terra-cotta. Made from a clay found in the same pit as the coal which did the mischief, it seemed about the only building material which could successfully withstand its corroding influence. In terra-cotta the fire would at once give us those beautiful accidental tints of which we might avail ourselves if we chose boldly to use them. Terra-cotta wanted treating in a way peculiar to itself. First, by the use of small blocks, that it might be fairly true, though thoroughly well burnt; secondly, by the use of such forms as would permit of its being securely keyed; thirdly, by using such ornamentation as would best draw off the eye from the slight inequalities arising from its drying and burning; and lastly, full play ought to be given to the diversity of tint. In concluding, Mr. Waterhouse observed that we wanted the trained eye and the observant mind to design originally with due refinement and restraint; and that he rejoiced to believe the schools of art were giving that to their students. And he trusted that they might yet see the day when not only the greatest workshop of the world, but the greatest, the most famous art workshop of the world, would be Birmingham.

GLASGOW INSTITUTE OF ARCHITECTS.

THE annual dinner of the members of the Glasgow Institute was held on February 23. The president, Mr. James Thomson, was chairman, and Mr. David Thomson, vice-president, was croupier. The chairman, in proposing "The Glasgow Institute of Architects," said:—

A new style of architecture is said to be a want of the time—this has indeed been said for many years. It has also been said that there is no more use for a new style in architecture than there is for a new language. In the meantime I fear we must be content to remain without any very extreme novelty in architecture; for with all the modern building Paris has not begun, nor has London led the fashion. The architects of the present day, instead of endeavouring to follow up the outline of a new style, are too apt to fall back upon a useless phase of design about 150 years old which was turned aside by their predecessors, and thought to be buried out of sight along with the men of the same period. No doubt in 1850 Joseph Paxton assisted in the creation of a style of building for the Great Exhibition of 1851, which has ever since become useful and necessary for many purposes. A style very much criticised and cried down by architects and men of very fine taste, it has for all that found a place for itself, for the Crystal Palace was admirably adapted for its purposes or for any purposes where light without impediment is required. The ancient idea of bulk and strength here gives way to strength and lightness, and I say it is far better to run the gauntlet of criticism—that iron construction is incompatible with true architecture—than to ignore the new demand for construction with plenty of light to suit business requirements. And I am not sure that amidst all the buildings put up for exhibitions or warehouses since 1851 that there has been anything better in that direction. As architecture is a progressive art, our members ought always to be on the alert, so as to assist in its development. While the architects of Glasgow have always endeavoured to advance in the better class of construction and embellishment of the buildings entrusted to their care, there is cause for thankfulness that the citizens have always been willing and able to give the money that was necessary. No one that has known Glasgow of the past generation has failed to see the interest that has been taken in the careful laying out and building up, not merely the new portion of the town, but also in the remodelling of old parts, now removed and replaced by modern work, and I think we need not be ashamed to say that the members of our Institute have been the means of bringing this state of things about,

men who, if not originally of Glasgow, have become identified with it because of their work. The City Improvement Trust scheme has done much to develop the resources of our members, for, as the new streets and places were opened up, there were new requirements in building. The School Board, too, has developed energy in the way of planning school buildings which for comfort, suitability, and elegance are unsurpassed. Our Institute has always considered it to be their duty to step forward and give advice in important matters relative to work in our city, and recently its Council has gone into the merits of two questions which have been very much before the Institute and the public. On these points I would say a few words. 1st. The competition for the new municipal buildings. On this head probably my remarks may be judged as one-sided, on account of my opposition to the principle of competition altogether. Certainly there has been nothing done in this fresh competition to alter my views; and while I do not grudge the successful man his prize, I think the public would have been as well suited and as well pleased with a professional man at home. Large public buildings such as these have been for some time very scarce, and the profession in Glasgow were naturally anxious about these new municipal buildings that they should get into proper hands. The Institute knowing the difficulties which beset competition arrangements of all kinds, placed themselves in communication with the Town Council with reference to the clauses of the competition. It is certainly very amusing to study the different apologies for the system of competition as given forth on the general question, for it requires a good deal of round-about argument to back up the necessity for the system. The assessor, Mr. Barry, of London, tells us that the principal points which struck him as demanding consideration were the insufficient and often contradictory nature of the instructions to competing architects; such instructions were more often than not drawn up by men totally unfitted for the task, and consequently they abounded in pitfalls for the professional men who competed. The architect for the proposed building has been appointed by the Town Council, but it was considered by many that the designs prepared by the unsuccessful competitors should also have been exhibited, but this was only done in respect of the exhibition of the ten designs, and the Institute had to undertake the responsibility and expense of exhibiting the rest of the designs. 2nd. When the new Police Bill was brought before the public last year our Institute considered it their duty to address themselves to the Town Council on the matter, and give their views relative to what they considered should be done so far as matters pertaining to buildings, streets, drainage, &c., were concerned. Their views were explained in a very simple way—that all necessary building regulations should be embodied in a Building Act applicable not merely to the city, but also to the suburbs, and asking for delay. No wonder then that our members were disappointed at the way in which they were passed over and their overtures for meeting rejected by the Town Council until the last moment, when there was no time left for discussion; and the more especially that “Lord Provost Ure has all through his municipal career taken an intelligent and warm interest in all matters relating to sanitation.” It has been said that to have a Building Act on the model of the Metropolitan Building Act it would be necessary to abolish the Dean of Guild Court. I do not see that at all. The fact that the Dean of Guild Court having been set up at a time when there was but little work for it to do, save a lining now and again in the burgh, does not preclude the idea of the Court having grown in usefulness with the extension of the city. And with a competent man like our present Master of Works, there should be no difficulty in seeing any Act relating to the buildings, streets, &c., carried out. This matter has been considered by the Institute to be one of very great importance to all who are interested in the welfare of Glasgow. And the members expected that they would along with others interested be consulted in any change of the laws, and were naturally anxious to see proper clauses introduced, under a separate Act. You are aware that after the revision of the clauses in this new Police Bill, the draft of it was then placed in the hands of the Lord-Advocate merely as a suggestion for the framing of the general bill. Our reports and suggestions will also be forwarded to him, and I trust that all the matters referred to in connection with the new Bill will be placed on a proper footing. Before leaving this subject I would say that there is no doubt that house drainage should be a separate class of work, and no longer left to the wall building masons and their labourers. I have often thought of this matter of drainage as important as plumber work, if not more so, although the money value of it does not come to much. These important details relating to drainage have hitherto been left too much to the ordinary contractor, and we now know too well how they have been neglected—drain-pipes being hurried into the trenches and covered up as fast as possible. For a time it was supposed that the new stoneware glazed pipes—with all their perfect bends and joints—would make everything safe in its superseding of the old culvert or drain, sometimes constructed with a slab board for a sole, a brick side, and their uneven covers; but it has been found that even these piece-glazed conductors were a greater evil in the more swift inlet of foul air, with joints made good but the main connections neglected, or, as I said before, when the pipes were buried out of sight with no jointing at all. I can scarcely speak in strong enough language condemn-

ing the builder who knowingly allows the pipe drains to be formed with a bit of clay on half of the joints, and nothing at all on the other, and the many modes of working to get this department of the contract put out of hands as fast as possible. I would add just one word, and that is with reference to the coming “Sanitary Congress” in our city, in the hope that you will take a special interest in helping it forward. I trust that, in this coming exhibition of sanitary appliances, we shall have a useful exposition of everything that bears upon the subject.

The remaining toasts were proposed or responded to by Messrs. John Honeyman, John Baird, Alexander Petrie, T. J. Watson, J. Henderson, J. Sellars, jun., John Hutchinson.

THE LERWICK TOWN HALL.

THE new Town Hall in Lerwick, Shetland, has been adorned with stained glass windows, sculpture, and other decoration without cost to the burghers. The following is the list of gifts up to the present:—Double-light window, presented by the Earl of Zetland; double-light window, presented by Sheriff Thoms; single-light window, presented by Miss Cameron Mouat of Gardie; single-light window, presented by Miss Fawcett, niece of the late Mr. Frederick Dundas, M.P.; double-light window, presented by Hon. J. E. Dundas, M.P., Lord-Lieutenant of the county; single-light window, presented by Mr. G. H. B. Hay of Hayfield; single-light window, presented by Zetland Commissioners of Supply; single-light window, presented by Mr. R. G. C. Hamilton, Secretary to the Admiralty; single-light window, presented by North of Scotland Steam Navigation Company; single-light window, presented by fishcurers of Shetland; oriel window, presented by Town Council of Kirkwall; main-staircase window, presented by Morton Lodge, Lerwick; escutcheon in white marble, presented by Lord Morton; carved stone chimneypiece, presented by Mr. L. F. U. Garriock of Berry; carved stone chimneypiece, presented by Mr. T. W. L. Spence of Uya, and Dr. R. Spence; lancet window, presented by Major Cameron; lancet window, presented by Mr. John Bruce of Sumburgh; lancet window, presented by the late Mr. John Leask of Sand; lancet window, presented by Mr. D. Edmondston; stone shield of arms, presented by Mr. T. S. Peace, architect, Kirkwall; ornamental clock, presented by representatives of the late Mr. Joseph Leask; painted glass medallion, presented by city of Amsterdam; painted glass medallion, presented by city of Hamburg; shield of arms, carved in stone, presented by city of Edinburgh; shield of arms, carved in stone, presented by city of Aberdeen; shield of arms, carved in stone, presented by city of Glasgow; shield of arms, carved in stone, presented by town of Leith; pair of ornamental lamps; polished granite pedestals for lamps; four panels in carved stone, with shield of arms; arms of Lerwick, carved in stone; inscription panel, carved in stone, provided by Decoration Committee.

The Rose window, situated in the north gable of the main hall, is now the only window not provided with stained glass. The original plans of the architect show the plaster of the wall surfaces of the main hall to be finished in diaper work, and the ceiling to be painted with heraldic shields in gold and colours.

ST. GILES' CATHEDRAL, EDINBURGH.

A MEETING of the Edinburgh Architectural Association was held on Saturday afternoon in St. Giles' Cathedral to view the restorations which have for some time been in progress. About seventy of the members were present, headed by Mr. G. Washington Brown, in the absence of Mr. McGibbon, president. Mr. W. Hay, the architect of the restorations, explained the various changes which have been made in the interior of the building since 1830, when the venerable structure was modernised to the taste of that period. The lath and plaster had been removed from the walls and from the stone vaulting of the roofs, and where stone carvings and mouldings were erased to give scope to the free use of the plasterer's trowel they had been restored. The massive octagonal piers of the nave, which had been removed for slender fluted shafts with plaster capitals, have been restored to their original shape, from fragments found under the floors. These pillars are exceedingly imposing and grand in their severe simplicity of detail. The restorations on the Albany Chapel and St. Eloi's Chapel, which have been floored with encaustic tiles, marble, and mosaic work, and, together with the remaining ancient chapel on the south side of the nave, have been enclosed with elaborate wrought-iron screens, were examined and much admired. They then proceeded to the choir, tower, and transept, where restorations on even a grander scale than that of the nave is now within a few months of completion. When the restorations were first commenced, under a committee, the funds were found to be inadequate to such a thorough restoration as the present. Besides, people were hardly even then educated to the idea of any church being comfortable with unplastered and unpainted walls. When the walls were then uncovered to restore the stone behind, the

work was considered formidable and unsightly in its rough condition, and therefore the plaster was replaced. The munificence of Dr. Chambers, however, placed unlimited funds at the disposal of the architect, and he received instructions to carry out the restorations in the most thorough manner and in the best style of art. The choir was stripped of its plaster covering, and although some of the masonry was originally of the rudest description as regards the wall surface (gorgeous hangings, pictures, and altar furniture probably concealing all defects of this kind in its palmy days), it now presents a pleasing appearance of well-pointed broken ashlar, mostly old stone, with the original dressed surface, but rejointed. Mr. Hay directed attention to the peculiar groining of the older portion of the choir aisles, which was considered by the late Sir Gilbert Scott as unique, and as the most interesting thing about the building—the form of the groin being a sort of transition from the plain barrel vault to the later form of groined construction. He recounted the dates of the various portions of the ancient structure and numerous vicissitudes in its history. Some interest was taken in the new brass tablet in memory of the first Dean of the Cathedral, James Hannay, said to have been roughly handled by Jenny Geddes. He remarked that there were other versions of the story of the tumult, and that, according to the late Mr. Mark Napier, Jenny Geddes was a sort of myth, the only thing really known about her being that she was a rank Loyalist, and made a bonfire of her cottage stall, stools, and creepies at the Tron Church in honour of the restoration of Charles II. According to Dr. Balcanquhall, Dean of Durham, the well-known executor of the will of George Heriot, the Bishop who preached on the day of the tumult had the worst of it—that it was at his head a stool was aimed, which, had it not been caught by the hand of one present, might have endangered his life. The baillies and other officers put out the rioters, who retaliated by breaking the windows. The place was pointed out where the riot took place in the south-west aisle of the nave, where service was temporarily conducted owing to operations on the choir relating to the church being fitted for cathedral service. At the conclusion of the visit a vote of thanks was warmly accorded to Mr. Hay, and the members thereafter proceeded to Greyfriars' Churchyard, where upwards of an hour was spent in examining the ancient monuments.

FLAXMAN'S DRAWINGS.

ON Monday drawings and sketchings by John Flaxman, the sculptor, were sold at Messrs. Christies, and from the prices which were obtained it is evident that the appreciation of his genius is rising every year. In 1862 and in 1876 two collections of his drawings were sold: the first contained no less than 600 drawings, belonging to Miss Flaxman and to the Denman family, to whom Flaxman was related by marriage, and at those sales *The Knight of the Blazing Cross* was purchased by Mr. Denman for 61*l.* 19*s.*, to be afterwards sold in his Flaxman collection (1876), when it was bought by Mr. A. Denman for 136*l.* 10*s.* This interesting relic is a manuscript poem of Flaxman's, illustrated by drawings, and epitomised by him as *Hail, Wedded Love*, and dedicated to his wife on her birthday, October 6, 1796, from a husband, "grateful for 15 happy years passed in your society," was purchased for the Fitzwilliam Museum by Professor Sidney Colvin for 220*l.* 10*s.* It is a very plain thin volume of small quarto size, with 41 sketches in pen or pencil of the Knight's exploits, and six more finished drawings of the *Acts of Mercy*, with Flaxman's autograph dedication.

The number of duplicates or quasi-duplicates among Flaxman's remaining drawings is remarkable. This was particularly noticed when the Academicians were forming their representative collections in 1881, and so many duplicates came before them that a large number were put aside for this reason. In this week's sale there was a set of 27 drawings illustrative of the *Odyssey*, the original series being of the same number, which was sold to Messrs. Agnew in the former sale for 70*l.* 7*s.* only, while now these sell for 250 guineas. There were of the *Iliad* set, the originals of which are 39 in number, purchased by Messrs. Agnew in 1876 for 50 guineas, 23 only, which now bring over 200 guineas. Of the *Æschylus* set of 27, which were bought by Mr. Woolner, R.A., at the former sale for 74*l.* 11*s.*, there were 26, which in this case sold for much smaller sums. However it may be with regard to these variations, it was somewhat surprising to see how they found such favour with the purchasers, and brought prices about three times the amount of those first sold as the original finished drawings.

The following were the principal lots:—Various studies in pencil, 7*l.* (Rathbone). Iris descending; a mother and child, &c., 10*l.* 10*s.* (James). Instructing the young, a man and woman with children, classical designs, &c., 10*l.* (Mr. Woolner, R.A.). An angel descending to a man, sinners bound, and a mother and children, 11*l.* 0*s.* 6*d.* (Noseda). Contemplation; a mother and child, &c., 21*l.* (Noseda). A man before judges, studies of figures, &c., 21*l.* (Noseda). Boy and girl holding a Bible, &c., 7*l.* 17*s.* 6*d.* (Greenaway). Faith Hope, and Charity, Justice, &c., 11*l.* 0*s.* 6*d.*

(Whelan). Cherubs with a garland, 13*l.* 13*s.* (Greenaway). Edgar; Burke; head of Sir Thomas Lawrence, &c., and Earl of Liverpool, Marquis of Londonderry, &c., 13*l.* 2*s.* 6*d.* (Whelan). A figure in a quadriga, and centaurs, 14*l.* 3*s.* 6*d.* (Lock). Pediments, various heads, &c., 11*l.* 11*s.* (Prof. Colvin). Council of Jupiter, Minerva, and Mercury, 10*l.* 10*s.* (Mr. Knowles). Nausicaa throwing the ball, 22*l.* 1*s.* (Agnew). Descent of Minerva, 9*l.* 9*s.* (Knowles). Ulysses laid on his own coast by the Phæacian sailors, 6*l.* 6*s.* (Mr. Woolner, R.A.). The King of the Lestrigens seizing one of the companions of Ulysses, 3*l.* 15*s.* (Mr. J. C. Robinson). Among the illustrations to the *Iliad* were—Homer invoking the Muse, 6*l.* 16*s.* 6*d.* (Mr. J. C. Robinson). Homer invoking the Muse, 8*l.* 8*s.* (Proper). Pandora shown to the Gods, 14*l.* 14*s.* (Noseda). Thetis entreating Jupiter to honour Achilles, 13*l.* 13*s.* (Mr. Woolner, R.A.). Hector embracing his child, 14*l.* 14*s.* (Mr. Woolner, R.A.). Flaxman's account books in Rome, and Miss Flaxman's sketch book, 7*l.* 17*s.* 6*d.*; his journals of tours in Italy, 14*l.* 14*s.*; some sketch books, 7*l.* 17*s.* 6*d.*; the Flaxman correspondence, chiefly family, 21*l.*; Flaxman's honorary silver gilt pallets (two), presented by the Society of Arts when a boy twelve and thirteen years old only, 12*l.* 1*s.* 6*d.*; his gold pallet, from the same Society for a bas-relief in clay, 1770, 11*l.* 11*s.*; the gold medal of the same Society for his design of this medal, 8*l.* 18*s.* 6*d.* The autograph letters from Blake, Coleridge, Wordsworth, Goethe, Rogers, Canova, Visconti, and other eminent men sold for good prices. The total of the drawings amounted to 1,485*l.* 19*s.* 6*d.*, and, with the books, autographs, &c., to 2,292*l.* 16*s.* 6*d.* The total of the sale in 1862 was 2,027*l.* 12*s.* 6*d.*, and that of 1876 was 2,168*l.* 8*s.* 6*d.*

THE LOCALISATION OF FIRES.

SOME interesting experiments in connection with this feature were carried out on Tuesday afternoon last on the Crown lands at the end of Northumberland Avenue, for the purpose of testing the powers of Hitchins's patent fire-resisting plastering and pugging. Although not an entirely new substance, it is at present comparatively little known; but we are glad to find that architects are beginning to specify for it. In face of the frightful accidents attended with the loss of life that has occurred within the last year or two from fire, public attention has fortunately been seriously attracted to the subject, and several new inventions and experiments have recently been brought to our notice. The localisation of a fire should undoubtedly be the paramount idea with all inventors in anything they may introduce; and, judging from the experiments we witnessed on the occasion in question, we consider Mr. Hitchins has scored a great success. A square brick building representing a two-storeyed edifice had been erected, with, of course, two ceilings, the top floor being open to the sky. The floors were $\frac{3}{4}$ inch thick, and the slabs of plaster were 1 inch in thickness, affixed to wire-netting in place of laths, the usual finishing coat being placed over the patent slabs.

In the first experiment a fire of wood well saturated with petroleum was ignited on the ground-floor, the first floor was left free, and another fire was lit on the top floor. Both of the fires in question soon burnt freely, and the ground-floor was soon an entire mass of flame. After a time windows cracked, sashes became ignited, and the "dressing" of the ceiling began to fall off in flakes until the whole had disappeared. But the ceiling proper composed of the patent slabs remained intact; and the most remarkable feature in this part of the experiment was, that when the fires were at their height several gentlemen mounted by a ladder to the first floor, and remained in it with a fire raging above and below them. Later on the fires were replenished, and another one lit on the first floor, making three in all blazing away at the same time. The dressing of the ceiling on the first floor fell off as on the one beneath it, but beyond that each one at the close of the experiments were as perfect as when the fires were first lit.

It must be understood that no attempt to extinguish the fires were made for about one and a half hours after they were lit, when a single hose pipe was brought into play. The amount of heat absorbed by the bricks by this time may be easily imagined, and the quantity of steam produced by the water playing on them was very great, but the volume of water appeared to have no effect upon the ceilings, as regards the cracking or destroying of them, and to all appearance at the close of the operations they were as perfect as at the commencement, and ready to undergo another ordeal of the same character. It may be remarked that between the floor above and the ceiling underneath a confined air-space is provided, and this prevents the joists from becoming burnt. Charred they are certainly, but beyond that receive but little injury.

In these experiments the ceilings were the only portions covered with the patent slabs, but they are as well adapted for the side walls of a building as for the ceilings, and are being so utilised, but it is not necessary to have them so thick for this purpose, three-eighths of an inch being generally sufficient. Making all reasonable allowance for contingencies, we are bound to believe this invention is well adapted for its purpose, and that if buildings generally were covered with the patent plaster, a large number of the serious fires that occur would be prevented. The experiments were witnessed

by a large number of the leading architects of the metropolis, members of the Board of Works, &c., who evinced considerable interest in them.

EXPLORATION IN ASIA MINOR.

A MEETING was held lately of the subscribers to the Asia Minor Exploration Fund which is being raised with a view of enabling Mr. W. M. Ramsay to continue his archaeological researches in that interesting part of the world. A sum of about 350*l.* having been contributed by the middle of last month, Mr. J. Edward Pfeiffer offered to add 50*l.* should a further amount of 150*l.* be forthcoming. Of this two-fifths, it was announced at the meeting, had already come in. Mr. Bywater, Fellow of Exeter College, Oxford, having been called to the chair, read a letter of Mr. Ramsay's, dated Cambridge, December 5, 1882, and giving as the writer's permanent address, "care of British Consulate, Smyrna," in which city he now was. The communication was addressed to Mr. Bywater, and discussed the exploration of Asia Minor, so far as it related to the history of the west, under four heads. First came the Ægean coast and adjacent islands, which might best be explored in the late autumn and early spring, the greater part being dangerous throughout the summer and early autumn. The fittest centre was Smyrna, whence particular districts might be explored in excursions lasting two or three weeks each. The writer had found the expense to be from 1*l.* to 25*l.* a day. Next might be taken the interior of Asia Minor, the western portion of the great central plateau, including Phrygia, the mountainous parts of Lycia, Caria, and Pisidia. The district lay so high that it could be explored in the summer and early autumn only, say from June 1 to November 1, in which latter month the wet, cold season set in. There were two ways of exploring this field—namely, either to settle in a large town, preferably Kutayah, and make it a centre for shorter excursions, or to make one or two long journeys, starting from and returning to Smyrna. The obstructiveness of the Turkish authorities was the growing bane in either case, as was illustrated by the arrest of Professor Hirschfeld as a spy on his mission to Paphlagonia, and by the impossibility of fruitful explorations without a firman. Moreover, travelling in this district was much more costly than on the Ægean coast. The best centre for surveying the south coast, Cilicia, Pamphylia, and the coast parts of Lycia, was Adalia. Of the last section, the north coast from the Bosphorus to Sinope and Amisus, Mr. Ramsay knew nothing. It had never been explored. Having given this outline of the work to be done in Asia Minor, the plan he recommended was to make some explorations on the Ægean coast during the spring of 1883, and in June to go into Phrygia, and to spend there most of the fine season, lying by during the rainy fortnight or so in September, and resuming in October, the most delightful month of the year. The parts Mr. Ramsay was most eager to examine were Erythræ, Samos, and Katakekaumené round Koula and Gordis, the neighbourhood of the Midas necropolis, the Upper Mæander, and the route of the Ten Thousand between Pelte and Thymbrion. The subject having been discussed, a committee was appointed on the motion of Mr. R. N. Cust, hon. secretary to the Royal Asiatic Society, to consist of Mr. D. B. Monro, Provost of Oriel College, Oxford; Mr. H. F. Pelham, Fellow of Exeter College, Oxford; and Mr. James Fergusson, F.R.S., with Mr. George A. Macmillan as hon. secretary and treasurer, and to report to a future general meeting of the subscribers to the fund.

The Decoration of St. Paul's.

SIR,—Probably some of your readers may hold that an artist endowed with the consummate gifts of the late Alfred Stevens may have had also his share of common sense.

Further, it may be supposed that such a man was little likely to exercise his sense or employ his skill in "sheer and ridiculous wastry," such as your correspondent—"A Country Architect"—charges against the projected decorations for St. Paul's, on the basis of Stevens' magnificent design.

After complacently stigmatising as "ridiculous" a treatment adopted by Stevens, endorsed by Sir F. Leighton and Mr. Poynter, and sanctioned by the practice of art at its noblest periods, "A Country Architect" seeks to dispose of the question on his *ipse dixit*, and declines to discuss a point which he says "hardly admits of argument." After thus settling matters in question to his own satisfaction, he falls foul of Sir F. Leighton's design—or rather the theme of it—"The sea giving up its dead." While admitting, *en passant*, the skill of the artist, he airily brushes away the Christian doctrine of the resurrection of the body as another fiction unworthy his consideration. Painters and sculptors, being artists "to the manner born," are content to speak by their works, as artists should. Architects rarely, perhaps never, inherit their

art claims by gift of nature. The architect is made, not born. Yet he is not content to confine his judgments to architects and architecture. He is ever ready, in and out of season, to admonish artists on questions of colour and decorations, and generally to pose for artistic omniscience.

I fail to discern the warrant for this assumption. In the present instance we have art and theology set in order by one who thinks his authority sufficiently vindicated by signing himself "A Country Architect." Perhaps, sir, to this you will print the demur of

Your obedient servant,

Feb. 28, 1883.

A LONDON ARTIST.

SIR,—It is a pity the "Country Architect," whose letter was published last week, did not send with his letter an immaterial view of the final resurrection. I for one should have liked to see how he could express the triumph over death in a form that was not suggestive of humanity. The scheme of subjects for the decoration is, I suppose, as fitting as any that can be devised; and when the visions of the Apocalypse have to be depicted, I cannot understand how any artist can set aside material forms. We know of nothing nobler than the human form, and we cannot imagine anything nobler. Where attempts were made by Egyptians, Assyrians, and others to express powers more than human, they have not been successful. It was well said by the Greeks that on earth there was nothing so great as man, and we may as well accept this fact. Sir Frederick Leighton need not therefore trouble himself when critics like the "Country Architect" carp at his design. Precisely similar objections have been uttered against the figures in the Sistine; but not one of the critics has tried the experiment of sketching a Last Judgment made up of spiritual essences. If the "Country Architect" is able to give us a panel that is not suggestive of anything earthly, he will have accomplished a feat which hitherto has been supposed to be beyond the reach of art.

But the "Country Architect" is opposed to all decoration, material or spiritual, of the dome. He prefers "the mysterious gloom" which now pervades it, and he thinks that every one with the most ordinary kind of common sense would agree with him. Now I think it will be admitted that Sir Christopher Wren was not deficient in common sense. Yet his desire was to have the dome filled with bright mosaics. The existing figures which Thornhill painted and Parris restored are not to be taken as evidence of Wren's views. They are merely makeshifts, although, such is our deficiency in colour-sense, they are supposed to be most appropriate in style. Another man who was not deficient in common sense was the late Professor Cockerell, who for years had charge of the fabric of St. Paul's. But although his taste was severely classic, he also considered that the dome ought to be adorned with pictures in mosaic. With those examples to justify them, the Decoration Committee need not be apprehensive of the result if they introduce mosaic into the dome; and it may be added that the figures by Sir F. Leighton and Mr. Poynter will not be unworthy of a position in the greatest of modern churches.

I am, yours obediently,

A LONDON ARCHITECT.

ARCHÆOLOGY.

The Baths of Agrippa, Rome.—The first number of a new English paper, *The Roman News*, was published in Rome on the 3rd inst., and it is likely to become no less indispensable to English and American visitors than *Galvani* is in Paris. Attention is given in it to archaeology and art. The first number contains the following account of the Corinthian capital and part of the entablature which were discovered near the Pantheon:—"Among all the monuments of Ancient Rome, belonging to the romanized Corinthian order, the grandest is undoubtedly the Pantheon built by Marc Vipsanius Agrippa, the valorous admiral who contributed so much to the victory obtained by Octavianus at Azio. This imposing pile, to which so many generations of lovers of art have come as to a shrine, has at last been properly taken care of and freed from the wretched, tumble-down buildings that leaned against it at the back and not only disfigured the edifice but also injured it. Every intelligent person must feel grateful to Guido Baccelli, the present Minister of Public Instruction, who has so ably and courageously carried out his plans in favour of the Pantheon and, despite the attacks meant to discourage him, succeeded in delivering the magnificent monument from all the rubbish that had clung to it for centuries. While clearing away the unseemly buildings and carrying on excavations, a wall belonging to one of the halls of Agrippa's thermæ, the locality known as the *Ephebeum* of the thermæ, was discovered; this hall was ornamented by a splendid Corinthian trabeation, a piece of which has fortunately been handed down to us in excellent state of preservation. If, as we said, the Pantheon is the grandest monument of the Corinthian order to be seen in Rome, the fragments of the trabeation of Agrippa's Ephebeum form another and most precious monument of the same epoch, of the same order, and of yet finer artistic sentiment. This frieze is one of the most exquisite samples of the taste possessed by the Romans in their architectural orna-

mentation. A trident, surmounted in the lower part by a shell, is represented between two dolphins; this design is repeated all along the frieze, and interrupted every now and then by acanthus leaves. The modelling of the dolphins, that seem really fleshy, if one may use this word, the softness and elegance of the leaves, are all most masterly. As the trident, the shell, and the dolphins are the attributes of Neptune, some persons opined at first that the building discovered at the back of the Pantheon might be the remains of the famous Portico of Neptune built by Agrippa in the Campo Marzio. This is not correct. The plan of the hall discovered proves that it could never have been either a portico or a basilica, as the monument erected by Agrippa must have been. It was only natural that Agrippa should have the attributes of the god of the waters carved in his *thermæ*, he who owed that deity the victory of Azio. The same emblems were represented much later in some mosaic pavements of the *thermæ* of Antoninus Caracalla; and as the *thermæ* themselves had their *raison d'être* through the waters, it was most appropriate that the symbols of Neptune should form part of their ornamentation."

Cliff Castles.—At the meeting of the Royal Institution of Cornwall on Monday last week at Truro, a paper by Mr. H. Michell Whitley was read on "Cliff Castles in Cranstock and Perranzabuloe." The first of the castles referred to were those at Penhale Point, Perran Beach. The main headland forks into two points, the southern being designated the Ligges Point, and the northernmost Penhale Point, both of which were formerly defended by a cliff castle. The summit of Ligges Point appears to have been capped by a barrow, slight traces of which still remain, and there are traces of the entrenchment about midway from that spot to the engine-house of Penhale Mine. The line of defence ran across the neck of land from sea to sea. There are no wells within the castle walls, and no means of landing under the cliffs of the enclosed area, neither were there any traces of hut-circles. About a quarter of a mile from the end of Penhale Point a site had been fixed for a line of defence across the point. The defence had been a very formidable one. The total width of vallums and ditches is 65 feet. As evidence of the pains bestowed on its construction, the outer ditch was cut on the top of the hill through the solid rock. No well can be traced inside the area, nor any signs of hut-circles. A mile and a half north-east of Penhale Point is Kelsey Head, which bears on its summit an entrenchment, which is so prominent as to have been inserted in the ordnance map as a "camp." The ditch has in places been cut through the solid rock. The space enclosed is about three acres, and no trace of water or habitation is to be found within. A flint celt was found below 3 feet of soil, but flakes and shattered flints are abundantly scattered over the whole of these northern headlands. The men who cut trenches through solid rock had better tools than a shattered nodule of flint to accomplish such work. About a quarter of a mile from the entrenchment is a large barrow. It is a noteworthy fact that every headland from Perran to Kelsey Head bears a cliff castle on its extreme point. On the three headlands, Kelsey Head, Penhale Point, and Pentui Point, landing within the fortified area would have been, with the ships then existing, nearly a matter of impossibility even in the calmest weather. That no hut-circles or wells can be traced seems to point rather to these castles being places for temporary shelter for the inhabitants than for an invader dependent on his fleet. That they were more than places for the safe keeping of cattle is also apparent from the existence of the double vallums at Pentui Head.

LEGAL.

Supreme Court of Judicature—Court of Appeal.—Feb. 24.

(Before Lords Justices BRETT, COTTON, and BOWEN.)

SHUBROOK v. TUFNELL.

THE EASEMENT OF SUPPORT.

This case raised an important point as to the right of support for houses. It will be seen that the case having passed through many phases of expensive litigation, the parties are in much the same position as at the outset. It appeared that the defendant was the owner in fee of certain land which, in 1878, he leased for 99 years to one Clarkson. Previously to the lease two houses, separated by a party wall, had been built on part of the land. Another part of the land, so let, was made into a private road adjoining one of the houses, and leading to a cricket-field. In 1878 Clarkson leased the road to one South, to be used as an entry to the cricket-field, and subsequently let to the plaintiff the land on which the houses were built, but without any express reservation of a right of support for the houses. After this last lease was granted the defendant made, under the road, a drain from the cricket-field to the main sewer. The making of this drain caused a subsidence of the soil, which caused injuries to the houses, in respect of which the plaintiff brought the present action. The plaintiff contended that the defendant had deprived him of his right of support, and also that he had been negligent in the construction of the drain. The defendant contended that the facts showed no right of support, and that, assuming negligence, no action would lie because

there was no infringement of a right of support. The case was originally tried in May 1881, before Lord Coleridge and a special jury. His lordship intimated that the plaintiff should be nonsuited, but an order was made, by consent, for reference to an arbitrator to state a case for the opinion of the Court. In May 1882 Mr. Justice Manisty and Mr. Justice Williams gave judgment for the plaintiff on the special case, being of opinion that the right of support was, in the circumstances, a right of necessity. The case was then taken by the defendant, as an interlocutory appeal, to the Court of Appeal, but it was ordered to be entered in the final list.

In the course of the argument their Lordships said the plaintiff's argument was, in effect, that the right of support was claimed as an easement of necessity in the particular circumstances of the case. But their Lordships were of opinion that the special case did not set out the facts necessary to enable them to decide that point. They would, therefore, postpone the hearing until the additional facts were found by the arbitrator. The case would be sent back to him to try these issues—whether the support from this road was required properly to maintain the houses—whether, if so, the defendant knew, or ought to have known, such support was required, and also whether the drain was constructed with ordinary skill and care.

High Court of Justice—Chancery Division.

(Before Mr. Justice FRY.)

GOODACRE v. WATSON AND OTHERS.

PREPARING GROUND FOR SUBURBAN HOUSES.

This was an action brought by certain gentlemen residing near Fulham Road to restrain a Mr. J. M. Watson, the occupier of a piece of land known as Dancer's Land, on the Fulham Road, from depositing or allowing to remain on the land any solid or liquid refuse, or otherwise using the land so as to occasion a nuisance. The action was, as is usual in such cases, brought on an interlocutory motion for an interim injunction till the hearing. There was very strong evidence of the nuisance complained of, the nature of which is stated in his lordship's judgment.

Mr. Justice Fry said the facts in this case were not in dispute. It appeared that two gentlemen, who have a building lease of a plot of land at Fulham in the neighbourhood of numerous houses, entered into a contract with the defendant Watson, the object of which was to allow him to remove the clay and gravel, and to substitute slops from the roads and the contents of the dustbins of the parish—at least, that was the way he had carried the contract into effect. The Fulham Local Board had thought it consistent with their duty to allow the refuse, not only of the parish of Fulham, but also of a portion of the parish of Kensington, to be carted to this place. A large portion of the matter of these cartings, which were sifted, seemed to be composed of vegetable and animal matter in a state of decay, which went under the name of "soft core." Now, this "soft core" had been allowed in some instances to remain uncovered for a time. It seemed, however, to have been ultimately got rid of by being placed under four or five feet of earth, for the purpose of what?—for the purpose of forming the foundation for future residences of human beings. Whether the refuse was directly under the houses or under the roads to his mind was of little significance. The clay was converted into bricks and the breeze used for making those bricks. The question he had to consider was whether the contents of these ash-bins, and the manner in which they had been dealt with, had or did create a nuisance to the plaintiffs. He thought there was very little doubt but that it did. It was true that the residences of the plaintiffs might be some distance from the scene of these operations, but there was evidence, he thought, that they were not without the bounds reached by the nuisance complained of created by this foul matter. The defendant, Mr. St. John, admitted that on one occasion he had himself perceived the nuisance, and had given directions for correcting it. The medical evidence, too, would leave no doubt in his mind how serious the nuisance which had been caused was. It followed that the injunction must go; but, before parting with the motion, it was impossible for him not to express the excessive and very painful effect which the evidence given on the hearing of this motion had had upon his mind. The obvious effect of that which, in a case like this, the builders, and those working under them, were doing, could only result in a serious detriment to the property; but besides this, there was another consideration as well to be regarded, and that was the injury they might be inflicting on the public health. It was nothing short of horrible to have to think that persons should found a scheme to deposit decaying matter for the purpose of what?—for the purpose of forming the foundation of roads and houses to be used by human creatures; and then they could come into Court and defend their conduct. Many a man had been found guilty of manslaughter for offences less morally criminal than that which these defendants admitted they were responsible for. He restrained the defendants, their servants, and agents from carting or depositing, or from permitting to remain upon Dancer's Land any solid or liquid refuse matter, or from throwing, or otherwise using any part of the land so as to cause a nuisance to the plaintiffs, and he made the order with costs.—Mr. Everitt presumed that the order referred only to the refuse on the surface, and would not require the removal of that which had been buried.

—Mr. Justice Fry said that it would apply to anything which caused a nuisance.—It was subsequently arranged that the injunction should be made perpetual.

SCHOOL BUILDINGS.

Clitheroe, Lancashire.—The corner-stone of St. Mary's Parish Church School was laid on Saturday last by Mr. Ralph John Aspinall, of Standen Hall, Clitheroe. The school is two storeys in height, and comprises infants'-room and two class-rooms on the lower floor for 320 scholars, and mixed school with six class-rooms on the upper floor for 680 scholars, as well as a large room for parish meetings. The outer walls are built with Yorkshire pier-points and dressings. The timber work is pitch pine, dressed and varnished. The work is being carried out by local tradesmen at a cost of about 3,500*l.*, exclusive of the site. The architect is Mr. William S. Varley, F.R.I.B.A., Blackburn.

Reading.—A block of school buildings have been erected for the Reading School Board, in Oxford Road. The schools are in two blocks, and give accommodation for 1,000 scholars—boys and girls. The work has been executed by Mr. Vaughan, contractor, of Maidstone, from the plans of Messrs. Morris & Stallwood, architects, of Reading.

Bedford.—The memorial stones have been laid of new Wesleyan Sunday Schools in Harpur Street. Red brick, with Bath stone dressing, will be used for the principal elevation. The ventilation adopted will be Boyle's system. Messrs. Usher & Anthony, of Bedford, are the architects; the contractors are Mr. J. Warton, Mr. H. Adams, and Mr. H. Walker.

Lowestoft.—A new school, erected at a cost of 1,400*l.*, has been opened, giving accommodation for 350 children. The architects of the building were Messrs. Goff, and the builders Messrs. Guymer & Wilkins.

CHURCH BUILDING AND RESTORATION.

Bishop Wearmouth.—The church of St. Thomas, John Street, has been reopened after alteration and renovation, which has been effected at a cost of about 3,000*l.*, from the plans of Mr. Johnson. Messrs. W. Scott & Sons have been the general contractors; Messrs. Walker & Emley, of Newcastle, carried out the warming and ventilation; and Mr. Halfknight the painting. The wood-carving of the chancel is by Mr. Snaith, of Sunderland, and the reredos is by Messrs. Hedley, of Newcastle.

Ettingshall.—A Wesleyan chapel has been opened at New Village, Ettingshall, near Bilston. The structure is built in the Italian style of architecture, with facings of best pressed bricks, strings, sills, &c., of best Greensill stone, and cornices of moulded red bricks. Accommodation is provided for 550 persons. The builders are Messrs. Bradney, Skett, & Butler, of Wolverhampton.

Kew.—At the Consistorial Court of Rochester, held on Saturday last, in the vestry of the parish church of Greenwich, the Chancellor, Dr. Robertson, had before him an application by the vicar and churchwardens of Kew, Surrey, for a faculty to enlarge and improve their parish church. It is proposed to pull down the mausoleum, which contains, among others, the body of the late Duke of Cambridge, and to re-erect it more to the eastward; to add to the church a chancel and sacarium, a north transept, and a south porch. Some of the parishioners had opposed the issuing of the faculty, but at the last moment they withdrew their opposition, and Mr. Crosse, who appeared for the opponents, merely asked that a bond should be given by the churchwardens to complete the work within a time to be specified. Dr. Swabey, on behalf of the churchwardens, objected to such a bond being required. The estimated cost of the proposed alterations is 5,000*l.*, towards which 3,000*l.* has already been collected by voluntary subscriptions, among the subscribers being the Queen, the Duke of Cambridge, the Duke and Duchess of Mecklenburg-Strelitz, and the Princess Mary of Teck. Dr. Swabey stated that there was no doubt the balance could be easily obtained, though the churchwardens objected to be bound to obtain it within a specified time. After hearing the arguments, the Chancellor decreed the faculty to issue unconditionally, unless an appeal should be prosecuted within fifteen days.

GENERAL.

Messrs. Maxwell & Tuke, of Manchester, have been appointed architects for the new school for 160 children at Townsendfold, Rawtenstall, which the School Board of Tollington Higher End have decided to build.

Mr. W. B. Richmond has been elected president of the Birmingham Society of Arts and School of Design for the ensuing year.

A Palette, which belonged to J. W. M. Turner, R.A., has been presented to the National Gallery by Mr. R. H. Nibbs, of Brighton. It formerly belonged to Mr. George Cobb, who acted as Turner's solicitor, and made the great artist's will, and who himself gave it

to Mr. Nibbs in 1869. The palette bears a label in Mr. Cobb's handwriting, declaring that "in 1824, at my request, Joseph William Mallard Turner, Esq., R.A. (now deceased), gave me the artist's palette hereto annexed."

The Will of Gustave Doré has been published. Seals are to be placed on all his pictures and works for two years, after which time they are to be sold by public auction.

Dr. Schliemann has concluded his explorations at Thermopylae. He has failed to discover any trace of the tomb of Leonidas and the graves of the Spartans.

The Rev. E. Seymour is about to resign the precentorship of Christ Church Cathedral, Dublin. To him is due the first conception of the restoration of the building, and it was through his suggestion and influence that his kinsman, Mr. Roe, was led to undertake the work.

Mr. J. Arthur Reeve was on Saturday last elected surveyor for the diocese of Norwich, in succession to Mr. E. L. Blackburn, F.S.A., and Mr. J. H. Brown, who resigned lately. There were thirty-three candidates, including Mr. J. P. Seddon, Mr. E. W. Tarn, Mr. E. Boardman, Mr. J. B. Pearce, Mr. W. O. Milne. The surveyors of the diocese are now Mr. R. M. Phipson, F.S.A., of Norwich, and Mr. J. Arthur Reeve, of Great James Street, Bedford Row, W.C.

Mr. R. B. Stewart, of Barrhead, has obtained the contract for the construction of the reservoir at Camphill, in connection with the Paisley waterworks. The cost will be about 23,000*l.*

A Discussion on the relative merits of Gothic and Classic architecture, and their adaptability to modern requirements, took place at the meeting of the Birmingham Architectural Association on Tuesday. The meeting declared in favour of Gothic by a large majority.

The Kent Archaeological Society have decided to hold their annual meeting this year at Ashford, towards the end of July.

The Bideford Town Council on Monday resolved to apply for powers for laying out 4,000*l.* in building the market.

Mr. Ponting, architect, has prepared plans for a new town hall at Marlborough, to include an assembly room and corn exchange, the estimate of cost being 5,500*l.*

Royal Hibernian Academy.—The Albert Scholarship has been awarded to Mr. R. T. Moynan for his picture, *The Last of the 24th at Isandula*, and an additional prize was awarded to Mr. Roderick O'Connor for his picture, *A Study in Rathfarnham Park*. Mr. Walter F. Osborne has been elected an associate of the Academy.

Mr. Frederick J. Shields has now completed his designs for stained glass for the Duke of Westminster's new chapel at Eaton Hall. The subject chosen is the "Te Deum," and Mr. Shields has had full scope to carry out his plan. The work is full of religious energy and learning, and is carried out with rarer artistic mastery than is usual in such designs. The walls of the chapel will be covered with mosaics, for which Mr. Shields will also furnish the designs.

Messrs. W. H. Lindsay & Co., of South Wharf, Paddington, W., have supplied all the columns, girders, and general ironwork employed in the erection of the new Slough Station on the Great Western Railway.

Messrs. Clark, Bunnett & Co. (Limited), of Rathbone Place, W., have just erected an iron fire brigade station at Thames Ditton, for the local volunteer fire brigade which has been lately organised by the residents. The building consists of engine-room and men's sitting-room, with small turret fitted with alarm bell. These buildings, being economically constructed and portable, are specially adapted for outlying suburbs.

A High School at Dumfermline, for the western district of Fifeshire, was decided on at a public meeting on Tuesday. A sum of 5,000*l.* has already been subscribed towards the erection.

Trades House, Glasgow.—The Building Committee of the members of the Trades House reported at the last meeting that, "having taken into consideration the plans and the report submitted by Mr. Gordon, they are of opinion that new buildings suitable for the requirements of the Trades House and Incorporations can be erected at a sum not exceeding 18,000*l.*, and they unanimously recommend that the House should empower the Building Committee to put themselves into communication with the architects who formerly submitted plans, and also with Mr. Gordon, with the view of these gentlemen sending in competitive plans for new buildings, the cost of which, when finished, including painting and all ornamentation, should not exceed 18,000*l.*, and report." The report was adopted.

Mr. T. Lewis, architect, Newcastle-under-Lyme, has given his award as arbitrator between the Stoke-on-Trent Board of Guardians and the trustees of the late Mr. William Kettle. The trustees claimed 250*l.* compensation for damage done by the diminution of light to premises in Charles Street, Hanley, in consequence of the erection of the new parish offices. The Guardians had offered 50*l.* in satisfaction of the claim, and Mr. Lewis awarded the sum of 60*l.*, the Guardians to pay the costs of the arbitrator.

SUPPLEMENT

TO THE

ARCHITECT.

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MARCH 3, 1883.

APPOINTMENT VACANT.

SOLIHULL.—Mar. 10.—Applications are required for the appointment of a Surveyor to the Rural Sanitary Authority. Salary, £150 per annum. Mr. F. L. Thompson, Clerk to the Authority, Bank Buildings, Solihull.

COMPETITIONS OPEN.

MORLEY.—Mar. 20.—Plans are required for new Wesleyan Sunday Schools. Rev. Wm. Griffiths, Wesley House, Morley.

NOTTINGHAM.—Mar. 15.—Plans, Designs, and Estimates are invited by the Corporation for the Erection of Municipal Offices. Premiums to the extent of 600l. offered. Mr. S. G. Johnson, Town Clerk, Municipal Offices, Nottingham.

RIPLEY.—Mar. 30.—Plans are required for the proposed Erection of Two Schools at Lower Hartsbray and Waingroves. Mr. Jno. T. Capon, Clerk to the School Board, Market House Chambers, Ripley.

SPITALFIELDS.—Mar. 3.—Designs and Estimates for Iron Roof are required by the Market Committee. Mr. R. Rayner, Elder Street, Norton Folgate, E.

CONTRACTS OPEN.

ALLOA.—Mar. 10.—For Alterations and Additions to Public School. Messrs. John Melvin & Son, Architects, Mark Street, Alloa.

ARMLEY.—Mar. 3.—For Building Eight Houses and Two Shops, Tong Road. Mr. C. F. Wilkinson, Architect, 3 Infirmary Street, Leeds.

ASTLEY BRIDGE.—Mar. 6.—For Building Chapel at Cemetery. Mr. James Lomax, Surveyor, 11 Fold Street, Bolton.

ATHERTON.—Mar. 7.—For Building Fireproof Mill and Construction of Reservoir for the Howe Bridge Cotton Spinning Company. Messrs. Bradshaw & Gass, Architects 19 Silverwell Street, Bolton.

BAILIFFE BRIDGE.—Mar. 6.—For Erection of a Cotton Mill with Engine-house, Staircase, and Premises. Messrs. George Hepworth & Son, Architects, Brighouse.

BARNLEY.—Mar. 3.—For Building House, &c. Mr. Evison, Tower Street, Barnsley.

BARNLEY.—Mar. 14.—For Building Warehouses, Workshops, Show-rooms, Stabling, &c., Market Street. Mr. Charles S. Milner, Architect, 9 Regent Street, Barnsley.

BATLEY CARR.—Mar. 6.—For Enlargement of St. Joseph's Schools. Mr. E. Simpson, Architect, Tyrril Street, Bradford.

BETHESDA.—Mar. 10.—For Construction of an Intake, Screening Chamber, Straining House, Service Reservoir, &c., Providing and Laying Cast-iron Water Mains, &c. Mr. James Mansergh, Engineer, 3 Westminster Chambers, Victoria Street, Westminster.

BEVERLEY.—Mar. 3.—For Alterations to Registrar's House. Messrs. Smith & Brodick, Architects, Cogan Chambers, Hull.

BIRKENHEAD.—Mar. 16.—For Construction of Retort House, 200 feet by 70 feet, and Two Chimney Stacks, 70 feet high. Mr. T. O. Paterson, Gas Engineer, Gasworks, Birkenhead.

BISHOP AUCKLAND.—Mar. 5.—For Building Chapel at Witton Park. Mr. Thomas Southron, Architect, 70 King Street, South Shields.

BISPHAM.—For Works at Parish Church. Mr. John Lowe, Architect, 22 Mansfield Chambers, St. Ann's Square, Manchester.

BLACKBURN.—Mar. 12.—For Building Wing to Infirmary. Mr. A. W. R. Simpson, Architect, Richmond Chambers, Blackburn.

BRADFORD.—Mar. 5.—For Building Washhouse, Drying-house, &c. Mr. M. Brayshaw, Architect, Bowling Old Lane, Bradford.

BRANDON PARVA.—Mar. 10.—For Building School-house. Mr. John B. Pearce, Architect, Surrey Street, Norwich.

BURNLEY.—Mar. 14.—For Building Four Blocks of Cottage Homes, Rakehead. Mr. T. Bell, Architect, Burnley.

BURNSALL.—Mar. 12.—For Rebuilding Bridge over the River Wharfe. Mr. J. Vickers Edwards, West Riding Bridge, Surveyor, Wakefield.

CARLISLE.—Mar. 10.—For Building Sunday Schools, West Tower Street. Mr. George Dale Oliver, Architect, Bank Chambers, Carlisle.

CIRENCESTER.—For Building Villas and Furniture Depository, Corin Street. Mr. T. C. Oven, Cirencester.

Export Orders promptly executed.
Contractors for Glazing Mansions, Public Buildings, &c.,
in all parts.
GREENHOUSES ERECTED.

PADDINGTON WORKS—13, 14, & 15 SOUTH WHARF, PADDINGTON, W.

LINDSAY'S
IMPROVED PATENT**REVERSIBLE TREADS AND LANDINGS**
FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 1.—Plan of Tread showing Cube Pattern.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be refilled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and the new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

These Treads can be fixed to Stringers of Wood or Iron, can be used for Spiral or Winding Staircases, and can be entirely removed without disturbing the Risers. The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works.

W. H. L. & Co. also desire to call the attention of Architects, Engineers, and general consumers to their large stock of Rolled Joists and Plates, from which Girders can be made up at the shortest notice. Drawings and Sections, with the strengths calculated, forwarded on application. Cast-iron Columns, Stanchions, and every description of Builders' and Contractors' Iron Work supplied.

CONSERVATORIES, ORNAMENTAL WROUGHT AND CAST IRON WORK,
Such as GATES, BALCONIES, RAILINGS, BRIDGES, and ROOFS, in all styles and designs.

MORTAR MILLS, ENGINES, BOILERS, TRAVELLERS, ETC.

ESTIMATES ON APPLICATION TO THE OFFICE,

PADDINGTON IRON WORKS, 13, 14 & 15 SOUTH WHARF, W.

The Architect.

COLOURED ARCHITECTURE FOR LONDON.

THE last of the architectural lectures for the present session at the Royal Academy, delivered by Mr. AITCHISON last week, had for its subject the application of colour to building design; and the lecturer made a strong point of the appearance which London presents, notably without such colour, as compared with the improved condition to which it might be made to attain if a moderate exercise of polychromy were encouraged by artistic, if not popular opinion. The aspect of the metropolis as it is we all understand, and few words need be wasted on its description. Brick being the ordinary wall material of the valley of the Thames, and cheap brick being what best suits the market of the day, our common streets are formed of rows of houses in which the rough and absorbent surface of such brickwork, kept moist by a wet climate, affords lodgment for a permanent coating of soot, which is constantly being thrown into the air from raw coal fires. How adhesive this encrustation becomes, and how irremovable it is, we can scarcely be said to know, inasmuch as prevention and cure seem to be alike untried in practice. The customary remedy for the evil is patient submission to it; and the hopelessness of the case is now being still better illustrated by the circumstance that people of a scientific turn are beginning to feel their way towards some purification of the atmosphere itself, rather than to think any more of the cleansing of the houses.

Mr. AITCHISON, however, would deal with the houses themselves. He would not wash them as they are, but he would, in the first place, like to make them washable, and, if possible, washable by the rain rather than the hose. Then, if washable for the sake of common sense, he would have them parti-coloured for the sake of artistic effect. This is obviously a very interesting question, and a thoroughly practical one.

The chief points for discussion in such a case are the climate and the materials. The climate must govern the practice, not only in respect of the exercise of atmospheric influences, chemical and mechanical, but with regard also to the scenic effect of atmospheric conditions upon the picture which the artist is to produce. The sky of Naples and the sky of London are as different in this view of the matter as the landscapes of Vesuvius are different from those of Primrose Hill; and the polychromatic decoration which may harmonise so well with the bright sunshine of the south might be entirely out of place when relieved against the grey clouds of the north. Even the misty, smoky character of the air must not be ignored in London, for the critical observer cannot even wait for a clear day—it comes so seldom; and the colouring of our houses, consequently, must accept amongst other conditions our hazy atmosphere, sometimes warm and sunny, no doubt, but much more generally dull and cold. For sky, again, we must be content to recognise the same probabilities of cheerlessness, notwithstanding that we have occasionally bright blue enough, and bright cloud well worth boasting of. The fog, on the other hand, and even the too frequent rain, we may perhaps consent to exclude from the argument; for no colour-artist could be reasonably called upon to work up to fog and rain, unless it were in some much more melancholy land where his art is little likely to flourish. The mud of London streets, too, the hurry-scurry of London traffic, and the dinginess of London costume, we need only mention in order to pass them by as considerations too recondite; doubtless Mr. AITCHISON could do more with a cleanly paving where the grass occasionally grows, and with quiet groups of figures in brighter clothing; but of this we may consent to say no more.

So much for our climate: what is to be said of our materials? It is easy to reply that English commerce can command all the world's dolomites, marbles, alabasters; but if we cannot offer hospitable weather to such dainty guests it is idle to invite them; and it may be as well to acknowledge without more hesitation that we seem to have nothing that really promises us fairly except clay. Not even common

freestones can profess to give us cleanly surfaces, to say nothing of variety of colour; and, however humiliating the fact may be, it is to brick that we must look, and to terra-cotta—possibly to pottery and porcelain—for all that we can hope to accomplish in external decoration by colour. Of course this is not much at the utmost; but Mr. AITCHISON, exhaustively as he has thought out the matter, suggests nothing else of any moment. Tinted cements might be approved by some, but not by many just at present; in one view of architectural design they are too much behind the age, in another perhaps they are too much before it.

The illustrations which Mr. AITCHISON is able to offer from actual London work are few and sometimes futile. The frieze of the Albert Hall, the encaustic tiles of a shop-front here and there, the deplorable fountain near Westminster Abbey, the mosaics of St. James's Restaurant, the glazed stoneware of Messrs. DOULTON'S factories, a few endeavours in variegated brickwork and terra-cotta—very crudely variegated as yet—and the too exceptional example of the Albert Memorial, may be said to complete the list; except in so far as a very small number of instances are to be found in which a monotonous glazed brickwork does duty for more expensive material, without at all raising inconvenient questions of either harmony or melody. The field is consequently pretty clear for any reformer who would grasp the problem as courageously as it deserves.

The practice of painting the fronts of houses with oil-colour may seem to be scarcely worthy of serious notice at the Royal Academy; but it may be well that Mr. AITCHISON has not ignored it, when he had to mention in the connection such names as those of Mr. PEARSON, Mr. TADEMA, and Messrs. CLAYTON and BELL. It cannot be hoped, however, that any public or even private artistic feeling that may be seeking gratification in coloured architecture could be permanently satisfied with this poor substitute, and the application of paint in such a way we may consent to identify chiefly with gin-palaces and compo and the display of Hebrew magnificence in Bloomsbury. Whether this kind of artistic effect is not indeed already running a little to seed may be judged of by the contemplation not only of bright maroon basements with black lines, but of such a thing occasionally as an entire corner-house in pea-green, sky-blue, or some bright terra-cotta tint quite as conspicuous, in unconscious rivalry of those shops of cheap and enterprising tradesmen which in former times used to advertise their importance in the leading thoroughfares of the older and shabbier suburbs by being wholly arrayed in the colour which so well suits our pillar-posts.

Taking it for granted that it is not this kind of polychromy that is to be desired in London, we may return to the question—as a very difficult one if it is to be entertained in the interest of true art—By what means, and to what degree, are we to introduce the graces of colour, in some measure structurally, into ordinary London architecture? Extraordinary work we may leave to the extraordinary inspiration of the occasion; it is the everyday design of street houses that really demands attention; indeed, it is in practice perhaps the treatment of shops and warehouses chiefly, for by the mere emulation of commercial enterprise these must certainly be allowed to lead the way.

One thing which Mr. AITCHISON did not bring fairly into his reckoning we may surely regard as within the range of practical policy, namely, the periodical washing of an ornamental façade, as it is done in Paris and elsewhere out of England. Granting this, there are two alternatives which offer themselves as regards the applicability of materials: there are those materials which would be available if to be washed, and there are those which would be available if to be not washed, but only rained upon. May it not be said at once that, in the London atmosphere, all natural stones whatever ought to be washed? And if so, is it not clear that almost any variety of foreign coloured stone then becomes usable? On the other hand, if the natural cleansing of the rain is all that can be calculated upon, it would seem that not only all descriptions of coloured stone, but even the best of brick and terra-cotta, must be regarded as impracticable, unless protected by a pottery glaze. Then arises the question how far we can really agree to accept a glazed surface; and perhaps the answer of most people will be that we cannot accept it at all. We wish at any rate we could persuade a few ambitious tradespeople to give their houses of business a thorough wash once a year. The example could scarcely fail

to be followed pretty widely as a necessity; and then the practice might possibly become more general still, and many difficulties besides those of coloured architecture might be put in train for settlement.

Whether the style of colour decoration ought to be simple and modest so as to accord with our atmospheric conditions, or bold and robust so as to defy them, we must leave to be debated; there is much to be said on both sides. It is enough for the present to affirm with Mr. AITCHISON that a love of colour is inherent in man almost as a passion; and to add, if this is so, that the advance of art in this country cannot possibly fail to demand the architectural use of colour before very long. It only remains for us to express the hope that the soundness of English taste may be exhibited, when the time comes, in something better than superficialism, and its muscularity in something better than imitation.

WATER-COLOUR PAINTING IN FRANCE.—II.

IN a late number of *The Architect* some of the works to be seen in the fifth exhibition of the Société d'Aquarellistes Français were described, and we now return to the subject. On entering the gallery the first drawings met with on the left side are some of sea-coast scenery by M. ERNEST DUEZ. *La Falaise éboulée*, the title of the first, well describes the rocks broken by a convulsion of nature on the margin of the sea-beach. A leafless sapling standing against the grey sky and stunted grass covering an upper ledge of rock, are the only traces of vegetation discernible; a retreating line of posts along the shore, and the toning of the rocks in harmonic colours produce a masterly effect of distance, which fetter attention to the drawing. Wilder still, and yet more weird, is *Après la grande marée*, in which the tide is out and a low range of basalt rocks fringe the shore. The subject in itself has no special attraction; to the poetic temperament of the artist alone is to be attributed the charm both drawings possess. A flash of lovely colour draws attention to three panels some 5 or 6 feet in height, on which M. DUEZ has painted, somewhat after the fashion of the Japanese, a tall hollyhock, a branch of dahlias, and a royal lily. A novel effect is given by a vast stretch of ocean beneath a starlit sky, as seen through the large blossoms of an iris. Immediate nearness and immense distance are cleverly contrasted.

Classic, academic, and beautiful as of old are M. FRANÇOIS'S five contributions. One looks in amazement at the vast amount of labour the venerable master concentrates on his work without the effort being apparent, so carefully does he avoid trifling minuteness of detail. M. FRANÇOIS some years back resigned his position as juror for the Salon in order to study nature in early spring. "I gave the Salon," he said, "thirty years of my experience, by which I lost *trente printemps*." In his *Torrent at Plombières* he shows a dense forest on a hill-side; an angry stream rushes onwards, breaking in turbid foam over the moss-covered stones which impede its progress. Light from the rear falls on the delicate foliage of some young oak, but does not penetrate to the gigantic pine trees which, black as ink, fill the dark foreground. Running water is also represented in the view in the Valley of Ajol, in the Vosges. We have an open glade, along which a rivulet flows in trembling clearness; bending in its course, it ripples over shreds of grey rock; water plants have grown among their shadows. This wet verdure is cleverly contrasted with crisp greens on the trees, which look like sentinels as they stand along the skirt of the wood, their leafage catching and reflecting an immense variety of lights. In the third drawing M. FRANÇOIS represents a lady gathering plants beneath a magnificent ilex by the side of a lake. The whole foreground is in half light, but sunny rays fall on the olive wood which fringes the opposite shore.

Few people will admit that, in his own special genre, M. LOUIS LELOIR can have a rival, yet the lady in the trailing robe of blue, by MAURICE LELOIR, gives us the unusual incident of two brothers devoted to art, running, if one may use the expression, a dead heat in their efforts to attain an ideal of perfection. The fair Italian is passing through a gallery of her palace, and gathers a fold of her train in her right hand, while she fans a passing breeze with her left, the fan cleverly breaking the outline of her figure against the white *boiserie* of the corridor. The design of the brocade is longitudinal; therefore the broken crush of the heavy material when the lady grasps it, and the ingenuity shown in giving a novel and

unexpected turn to the folds of the drapery, are clearly revealed. Grim humour generally pervades M. MAURICE LELOIR'S work. This year it breaks out pleasantly in his *Kermesse*, painted fan-shape, and framed by its purchaser with regal magnificence. In the rear are musicians perched on a gaily-festooned platform. Vigorously do the Dutch maidens dance to their inspiring strains; fun and merriment among their elders prevail to the right, around the carcase of an ox being roasted whole; while on the left, the host of the village inn draws beer from a monster barrel, a brazen vessel at his feet catching and reflecting a sunbeam which plays among the wild grasses on the sward. M. MAURICE LELOIR is an adept at the quaint tailoring and complicated dress of a past age, an aptitude he further illustrates in his *Au Sermon* in the cathedral of a country town, where the châtelaine from the neighbouring château on the front bench listens decorously to the preacher, to whose eloquence her lord in a scarlet suit gives somnolent assent; but the discourse excites deep interest in the crowded congregation, on whose countenances varying shades of opinion are depicted. The dark tones of the marble balustrade, which curves grandly from the pulpit in the immediate foreground, and the neutral tints in which the architecture of the old church is drawn, harmonise the varied colours on the costumes of the audience.

M. TISSOT'S etchings are to be preferred to the originals in water-colours. Yet the garden scene, in which some children have clambered on a bench covered by a rug of grey fur, is pleasing, especially the figure of the boy who rides astride on the back of the seat, the sunlight striking on his back, and outlining his figure in a line of gold, and the little girl who has clasped her arms over the bench, and whose head rests on the soft fur covering. Mdlle. MADELEINE LEMAIRE'S peaches are fresh from that happy hunting-ground of peach lovers—the sunny Montreuil. But better even than the rich colour on these *primeurs* is that of the bramble nestled against a wall of shadowy granite behind the fruit-basket. The brown berries and leaves, reflecting in fitful brightness a gleam of light which glints on the wings of an insect feeding on the half ripe fruit, are reminiscent of Nature's loveliest harmonies. As usual, representatives of the feline race, although the most difficult of subjects, are admirably portrayed by M. LAMBERT'S brush. M. WORMS again presents graphic delineations of Spanish life; of these, perhaps, the scene in the court of a *posada*, closed by a green trellised gate, and called *Le Jour de Barbe*, is one of the cleverest. The sun pours its hottest rays on the white wall of the hostelry. A sheltered corner, however, has been found by a man who is seen seated on a bench, and is being shaved by a buxom dame. She has partially covered her violet skirt by a green cloth, the crimson kerchief does not conceal her shapely arms. The man's upper person is clad in a jerkin of deep orange, thrown out by the violet of his shirt. This is a lovely bit of colour, glowing and intense, and is worthy of M. WORMS'S reputation. The queer-barred window overhead, and the brass dish which reflects the light over their heads, swinging, as it does, from the sign-post, are pre-eminently *cosas de España*, as are the accessories in a farmyard scene, where a majo and his wife, passing their stable, attract a horse by some grains the man offers.

The veteran, M. EUGÈNE LAMI, has revived the glories of the Grand Monarque's court. He paints the *Escalier des Ambassadeurs* in the palace on a reception-day, when the Doge's envoy, on being asked what surprised him most at Versailles, replied, "To see myself here." The drawing is interesting from its correct reproduction of the notabilities of the early days of LOUIS XIV.'s reign. One recognises, amongst others, the figure of FOUQUET, the Superintendent of Finances, as he whispers soft words to the blonde LA VALLIÈRE, who was the cause of his downfall; and CONDÉ, with his Roman profile, to whom Madame DE SÉVIGNÉ presents *la plus jolie fille de France*—later on, Marquise DE GRIGNON.

Baroness NATHANIEL DE ROTHSCHILD exhibits several river or canal views of Holland, and two clever Italian pieces, one of which brings before us a castle, on whose roofless walls the disgrace of ruin has fallen; their polished surface is scarred by streaks of moss. Strangers descend the staircase and peer curiously over its carved balustrade on the court below—not altogether bare, for in the interstices of its porphyry slabs strange wild plants have sprouted. A pitcher on the marble steps of the landing-place, and the heavy ring to which barges once were fastened, are reflected in the river which slowly flows along its outer wall.

In the lower corridor of the gallery are seven of M. TISSOT'S etchings, remarkable for the intense tone that artist has thrown on his paper, as well as for the delicate rendering of the flesh tints. The young girl who

will bring, spite the frost,
Beauties that the earth has lost,

defies the snow in which she elects to walk by the fur of her cape and the warm velvet of her feathered hat. The intense darkness on fur and hat is relieved by the transparent tones of her complexion. In another work the contrasts are less violent. The lady who has gathered her skirts in her hand, in order the more rapidly to pass beneath the shadow of a horse-chestnut, has scant time for admiring the star-shaped leaves which with somewhat geometric precision carpet her path; while she who reclines in a deep arm-chair enjoys the fragrance of the summer flowers blooming on the parterre with the languid indifference of an invalid. Powerful as are the effects given in these works, and admirable as is the science therein displayed, there is in each individual portrait an utter absence of distinction, and even of refinement, which mars their charm, although the absence of these qualities does not diminish the artistic value of the etchings.

MINOR EXHIBITIONS.

THE first water-colour exhibition of the newly-organised "Dudley Gallery Art Society" was opened at the old room last week. Considerable improvements have been made in the arrangements, including the removal of the door screen, and the substitution of a small screen in the length not the width of the room. But the number of pictures admitted, 534, has been in excess of the space, and the hanging line at the sides is absurdly high. However, ninety subscribing members, with a right to the admission of a given number of pictures, at once cover so much wall, that to admit a balance of outsiders really necessitated the compromise of a high line. The names of Academicians, and of members of the Royal Water-Colour Society are on the Council, but for the most part do not figure in the list of exhibitors. The gallery on the whole presents a good appearance. Among the cleverest work is that of Mr. ARTHUR MELVILLE—*The Call to Prayer, Midan Mosque, Bagdad, and Waiting an Audience with the Pasha*. These are sketches rather than pictures, the figures blotted in with a full brush suggestively; architectural matter given with enough detail to pronounce form and character in a brilliant way, the ensemble luminous and in complete tone. Also individual and vigorous are two homely landscapes and a study of manners, or pictorial "social note," as the phrase goes, called *Behind the Bar*, by Mr. J. H. HENSHALL; the painful realism of the group of tipplers is like a page from M. ZOLA: the people are indeed apparently French. Mr. HENSHALL'S touch is strong, but his colour is inky; the figure-piece is almost in monochrome. Another manly bit of work is that by W. LANGLEY (No. 260), a study of a grand old woman of the artisan class, seated in her arm-chair—one of those typical women of the people whose strong-featured expressive face tells a tale of bravely-endured hard life and well-won repose. The manner goes with the matter; the touch is emphatic and large, the harmonious colour grave but not dull. Further among figure subjects must be noted the brilliant appearance put in by Miss EDITH MARTINEAU, whose careful, close execution has never been turned to better purpose than in the largest of her six pictures, the graceful figure of *My Beautiful Lady*, standing against a background of blossoming hawthorn trees. It is a pity that the artist should have given the flesh tones showing through the transparent white dress so unpleasantly red a hue, while the green of the background seems to have run into the shadows of the skirt. Miss MARTINEAU is always a little uncertain, moreover, in the relative proportions of the figure, being apt to make the head too large and the arms too short; but so painstaking and clever an artist is bound to amend these faults in time. From Rome come one or two capital heads by Miss BERESFORD, rather in the style of GUIDO BACH. In landscape contributions, which, as usual, preponderate, there is a large average of work just beneath the highest excellence. The mountain studies of Mr. E. COMPTON and Mr. J. B. DONNE are the best in their line. The first artist is faithful, but rather ineffective; the last a little flashy, or over "spry," as JONATHAN would say. Among newer names

in landscape that should now secure a welcome are those of J. T. WATTS, H. MEDLYCOTT, F. MERCER, LINNIE WATT. On the screen will be found two little coast scenes sent by Mr. BRETT, of course consummate in their way. Excellent flower painting abounds; and in still life there is a study of the silvery scales of *Herrings*, by A. G. ADAMS, which is first-rate work of the kind. Altogether the exhibition may perhaps be said to justify by its quality the desirability of its existence, which in the overcrowded state of the art market is not slight praise.

At Messrs. DOWDESWELL'S are to be seen a collection of thirty-three water-colour drawings of cathedral cities of England and Wales, by Mr. BIRKET FOSTER, intended for engraving. The scale is miniature, and the drawing of extreme *finesse*. The somewhat conventional colour and smooth mode of execution, it may be presumed, have been adopted with reference to the interpretation of the steel engraver. The artist has chosen his points of view well, and has sought pleasing and popular effect, which will range the series with the style of illustration that was in vogue in the best landscape annuals of forty years since. In the same gallery are gathered eighty drawings by Mr. JOHN MOGFORD of the Institute, an artist who has considerable poetic sentiment underlying his somewhat showily effective transcripts of land and sea. The increasing custom of assembling *en masse* the works of one artist, it may be incidentally remarked, is not by any means always advantageous to the painter, although it may compel a tribute to his industry. As a matter of fact, there are very few artists who possess sufficient individuality of style or variety of subject to stand the test.

An exhibition of the kind just referred to is that of the Mediterranean and North Italian studies by Mr. POWNALL WILLIAMS at the gallery of Messrs. MACLEAN. The brilliant and "telling" quality of Mr. POWNALL'S work insures him a public; he has even a trick of luminous atmospheric effect, and seems of late to have taken a leaf out of Miss MONTALBA'S book in the management of strong oppositions. But clever as this slashing kind of art is, we think Mr. WILLIAMS is losing a faculty of observation and record of the more subtle effects of Nature, which we noted in the drawings he exhibited at the Dudley Gallery some years ago—a faculty of a higher kind than is required for most of the pictures before us.

Our venerable contemporary *Punch* has penned a rhyming critique about Mr. WHISTLER'S exhibition of his Venice etchings, and dry points, on which it would be impossible to improve. The "arrangement" of the gallery in gamboge and white, the yellow flowers and the yellow flunkey, the artist himself "airy and artful in attitude," the etchings "at present only half done," the catalogue of misapplied quotations from the critics—all this ingenious device for focussing public attention on himself has furnished delicious fun. It is Mr. WHISTLER'S own fault if—posing as the "wag of the day"—we find it impossible to take him *au sérieux* as an artist.

As we have ere now in these columns made the attempt, and given full tribute to his undoubted capacities, when he chooses to exercise them, as what it has become the fashion to call a "painter etcher," and that of the highest class, there is the less occasion to re-comment on those of the Venice etchings now at the Fine Art Society's rooms which are not new, or to draw attention to the loss of touch evinced in some of the fresher work, and the clever scribbling which does duty in others:—

"Vainly the critics will sit on him,
Why such a butterfly slay?
No one can e'er put the bit on him,
Whistler's the wag of the day."

AN ITALIAN DEFENCE OF THE RESTORATION OF ST. MARK'S, VENICE.

IT would appear from a pamphlet which has recently been issued by the Fabbricieri or Conservators of the Basilica of St. Mark, at Venice, that the remonstrance of the English St. Mark's Committee with regard to the works of restoration has not been without its effect in Italy, and that a more healthy public opinion is beginning to make itself felt in that country touching the past treatment of the Basilica, and the course to be pursued in the future with respect to it.

The pamphlet referred to, which is entitled "The Basilica of St. Mark, at Venice, in the Past and in the Future," is intended to

refute the accusations of the semi-official paper, the *Diritto*, as to the manner in which the works at St. Mark's have been carried out, and to contradict the statements made in an anonymous pamphlet published at Venice in the course of last year, under the auspices of a Committee composed entirely of English and foreign artists, entitled "The Future of our Public Buildings" ("L'Avvenire dei nostri Monumenti"), which created some attention in this country at the time of its appearance.

The authors begin by stating that "if there ever were a building for which the most accurate studies have been made, and upon which the most jealous care for its preservation for years past has been bestowed, that building is, without doubt, the Basilica of St. Mark. In fact, it was not until the time when the species of varnish with which the marble on the southern side had been coated, at the last restoration, had melted under the rays of the sun, and with the varnish had disappeared that appearance of splendour which for a time deceived the public, that it became the fashion (chiefly on account of the philippics of Count Zorzi) to convert into blame the exaggerated praise bestowed upon past works of restoration. Since that time an entire change has taken place in the conduct of the works, so that the person who was formerly at the head now only retains his title, and a successor has been appointed who has always, and not for a few years only, professed contrary opinions (to those of his predecessor?)—that is to say, those of the most religious respect for matters of art and history in the conservation of the building.

"It has been stated and repeated that from that time the works were stopped; the fact is that they were continued, at least if those repairs considered to be radical were not proceeded with, those which involved the greatest responsibility, inasmuch as they affected the decoration of the most conspicuous part of the Basilica—namely, the principal front—were still carried on. The fact is that one-half of this front was literally rebuilt (*rifatta*) under the eyes of the public, but with such circumspection and fidelity that even J. W. Bunney* (good soul!), who, under his big umbrella, photographed, so to speak, with his brush patiently, day by day, the forms and colours of that portion of the building, could never say that it had been altered one iota."

The Conservators go on to say that an important alteration was recently made in the carrying out of the works: that the system of letting out the work to contract was abandoned, and that a clerk of the works, who superintended the restoration of the church of San Moisè, had been appointed. They further state that the whole of the works have been done in conformity with the regulations laid down by the Commission appointed by the Government, and express their surprise that the prefect of Venice, in an official communication to the *Gazetta di Venezia* of Nov. 27 last, should have found fault with the manner in which the works have been carried out. The anger of the Conservators is more particularly directed against the authors of the pamphlet already referred to; and, adverting to a remark made by them that restoration is a lie from beginning to end, they thus proceed to express their opinions on the subject, opinions which amply justify the apprehension felt in this country of the unfitness of the Conservators for the charge confided to them.

"Whoever writes in this manner," they say, "does not reflect upon one simple fact, that just as you may put together a broken vase (as was done with the Portland vase, by way of example) or a statue which is in fragments, in the same manner you may pull down and reconstruct a building without altering in the least its form, colouring, &c., and that the more readily when the building consists of repeated and varied portions linked together as is the case with the exterior of the Basilica. Many alterations were made to St. Mark's in the past; but inasmuch as they were made with deliberation they were approved and applauded, and not because they were the inevitable consequences of restoration. In proof of this, one half of the principal front has been actually pulled down and rebuilt within the last few years, as we have already observed in the introduction, without anybody having discovered any alteration."

No one, as far as we know, is opposed to necessary repairs being made to St. Mark's; but what a large section of the English and Continental public object to is the entire refacing of the building and the correcting of those artistic and picturesque irregu-

larities and discrepancies—designed or undesigned—which, in fact, go far to constitute its value in the eyes of everybody who is qualified to judge. These operations have been carried out under the pretence that they are necessary to secure the stability of the fabric, and that the new work is every whit as good as the old work, which is irretrievably destroyed. It has been shown that the allegation that the front of St. Mark's is unsafe is absolutely without evidence, and this excuse is no longer put forward; but it will be seen from the foregoing citation that the Conservators are absolutely ignorant of the value of ancient art, and prefer the miserable mechanical imitations of old work done by modern Italians to the magnificent fragments culled from most of the countries of the world, which make St. Mark's a perfect reliquary of art, and the admiration of the civilised world.

This is what the Conservators have to say of the destruction of one work of art:—

"There is one innovation, it is true, mentioned in the pamphlet ('The Future of our Public Buildings,' already alluded to), and that is the missing head of the bas-relief of the Virgin, which has been replaced by a new one. This innocent—in fact, praiseworthy—addition the pamphlet considers an atrocity; and although of itself the act was worthy of approval, and not of censure, the author of the pamphlet endeavours to give the incident an appearance of suspicion; and having cited the case (which may be true or false) of a crucifix being destroyed at Pisa, for anybody who will pay for making a new one, goes on to say: 'A few days ago a new head was put to the Virgin in bas-relief on the front of St. Mark's. It is to be observed that this remark applies to a work which is in no sense an artistic work, but to a Virgin of Greek workmanship, with spiky outstretched arms in the act of benediction, of which we see so many in the Basilica;* and it is likewise to be noted that in place of the face there was a hole, which, after all, can be reopened whenever taste so far changes as to consider propriety in building to consist in holes and mutilation.'

This quotation will perhaps suffice to illustrate the principles animating the Conservators, and goes far to justify the apprehensions of the English and foreign artists. The allegations with regard to the head of the Virgin and the crucifixes at Pisa were made, we believe, on the authority of Mr. Ruskin.

The following is the text of the reply of the prefect of Venice to the memorial by Italian and foreign artists protesting against the rebuilding of the west front, from which it will be seen that the justice of the complaints contained in the memorial are abundantly justified, and that the errors in the past, in the treatment of the Basilica, are candidly acknowledged by the Italian Government.

"In his despatch of the 21st inst. (No. 9,786), the Minister of Public Instruction, in sending a copy of a memorial presented by you, protesting against the ill-treatment of the public buildings of this renowned city, by injudicious restoration, desired me to make known to you that he is happy that the opportunity has been afforded him of assuring you how completely the sentiments of the Government are in harmony with yours, and to echo your aspiration that the respect and veneration which you profess were transfused into all those entrusted with the preservation of our artistic patrimony.

"The Minister of Public Instruction has further charged me to make known to you his decree of July 21, and its accompanying instructions, with which I gladly comply, and send you a copy of a circular that has been sent to all the commissions for the preservation of public buildings for their guidance in future works of restoration.

"I am also directed to add that the Government is aware that to insure the observance of the rules contained in this circular that further arrangements may be necessary, inasmuch as it not unfrequently happens that the persons undertaking the works are deficient in intelligence and artistic education. And since, in the present state of culture among us, it is impossible to avoid the inconveniences arising from these defects, the chief care of the Government will be to avoid all unnecessary works, and in the meanwhile to lay down new rules for artistic education which may tend to the better preservation of public buildings.

"That care is requisite to avoid unnecessary restoration is evident from the foregoing instructions, on reading which you will understand that the Minister will never approve of works which

* Mr. Bunney's picture of St. Mark's was recently exhibited at the Fine Arts Society's Gallery, Old Bond Street. Mr. Bunney died at the end of last year, and his denial of this assertion cannot be adduced.

* These bas-reliefs are considered by Selvatico to have been brought from Constantinople. *Sulla architettura e sulla scultura in Venezia*. Ven. 1847, p. 52.

involve those alterations which you apprehend in the ancient work—as, for example, in the last arcade to the right, looking towards the Basilica of St. Mark—and will no longer admit the action of those who, to make work, destroyed like Vandals that which might have been preserved for ages to come; neither will he approve of that fiction of restoration of which you justly complain. On this you may rely, and the more so that the Minister has already given proof of his disposition with regard to St. Mark's, where he caused the works to be suspended as soon as it was possible for him to exercise jurisdiction over the Basilica, and this was done before the remonstrance by foreign artists with regard to the injury inflicted upon that renowned temple had reached us."

This last remark excites the anger of the Conservators, who declare that Count Zorzi was the first to point out the damage that was being done to the Basilica by the so-called restoration.

The pamphlet is amusing from its candid admission of incompetency, and will strengthen the hands of the St. Mark's Committee and the Society for the Protection of Ancient Buildings.

PARIS NOTES.

THE Salon Committee has decided to alter the regulations affecting the vote for the Médailles d'Honneur in the sections of sculpture and engraving. Last year all the exhibitors had a right to take part in the election, and only one vote was taken, so that the successful candidates might be chosen by only a relative majority of the votes cast. Henceforth, however, the electing body will consist only of those sculptors and engravers who are *hors concours* in their section, whether exhibiting or not, and of the members of the jury—the whole college being assembled, under the presidency of the chairman of the latter body, who will have a casting vote. Three votes will be taken, and the medals must be awarded by an absolute majority of the votes recorded personally, for artists will no longer be allowed to vote by letter, as hitherto.

On the other hand, the Société Libre des Artistes Français, at its annual meeting held last Saturday in the Salle de la Redoute, Rue Jean-Jacques-Rousseau, voted a series of resolutions proposed by M. Rozier, and demanding that the regulations of the 1883 Salon shall be amended as follows:—(1) Rewards to be henceforth unlimited in number; (2) that only one vote shall be taken, thus acknowledging the principle of relative majorities; (3) all votes to be signed; and (4) the sittings of the jury to be public.

These propositions will be submitted to the consideration of the Salon Committee of the newly-constituted Association des Artistes Français. There is, however, not much likelihood of their being adopted this year, nor indeed as long as the constitution of the Committee remains what it now is. When the powers of the body expire and its successor has to be elected, then the reforming or democratic party among the artists may succeed in naming a majority thereon, which will adopt these and even more sweeping changes in the management of the annual Salon.

At the same meeting the following artists were elected on the list of candidates for the jury of the painting and engraving sections:—MM. Humbert, Henner, Tony Robert-Fleury, Pille, Hanoteau, Maxime Lalaune, Hector Leroux, Vuillefroy, Guillemet, Benjamin Constant, Lavieille, Rapin, Jules Lefebvre, Roll, Lansyer, J. P. Laurens, Bonnat, Renouf, Quest, Français, Busson, Harpignies, Butin, Ribot, Feyen-Perrin, Puvis de Chavannes, Saint-Pierre, Maignan, Beauverie, Rozier, Bouquereau, Lapostolot, Barrias, Protais, Bouvin, Got, Luminois, Guillemet, and Bin.

A notice just published by the Association des Artistes Français reminds artists (painters) that the latest date for sending in their works to the Salon is March 15, and that not the slightest delay can be accorded in any case. Sculptors must have delivered their work by April 10, and after that date they will not be permitted, as in preceding years, to retouch or exchange their proposed exhibits.

The members of the architectural section of the Institute met on Monday last at the Ecole des Beaux-Arts, for the purpose of fixing the programme of the competition for the Grand Prix de Rome in architecture. This competition comprises three stages. The preliminary trial, from which are exempt those candidates who have already been *en loge*, or have carried off either a first or second medal in one of the competitions of the Ecole des Beaux-Arts, consists of an architectural sketch, for the execution of which only twelve hours is allowed. These sketches are exhibited publicly, and the jury selects those candidates, limited to sixty in

number, whom it considers worthy of taking part in the second stage, in which competitors have to show their capabilities in the execution of a complete architectural design, elevation, ground plan, &c. Finally, from the sixty the jury choose ten artists, who are allowed to enter the *loges* for the final competition, which extends over 110 working days.

Several archaeological curiosities have lately been added to the Louvre collection, the most important being a fine antique vase found by M. F. Lenormant during a late tour in Thrace; an obelisk from the site of the old Greek city of Himera, in Sicily; and three fragments of Phœnician sarcophagi.

Mdlle. Louise Abbema has just received the Cross of the Order of Artistic Merit (*Mérite des Arts*) from the Grand Duke of Saxe-Cobourg-Gotha.

The Lehmann sale at the Hôtel Drouot produced a total of 69,480fr. Of Lehmann's own works, the highest prices were paid for the *Mariage de Tobie* (7,600 frs.), *La Guerre*, *La Madeleine*, *Le Pêcheur*, and a portrait of Liszt, the composer. The collection, brought to the hammer owing to the death of the professor, also included several works by well-known artists, among which may be mentioned *Nature Morte*, by Charden; *Les Noces de Cana*, by Delacroix; *Cat, Mouse, and Pigeon*, by Philippe Rousseau; and seven paintings by Ingres. It may be remembered that Lehmann in his will left the sum realised by this sale to the Ecole des Beaux-Arts, for the foundation of a prize to be competed for by students in the painting section of the school.

At its sitting of last Saturday the Académie des Beaux-Arts proceeded to the election of a foreign correspondent to each of the sections of engraving and music. For the former the Academy's choice fell upon M. Paul Girardet, copperplate engraver, of Moudon, near Lausanne, Switzerland; while in music, M. Limnander, composer, of Malines, Belgium, was chosen.

The Exhibition of Decorative Art opened on the 1st of the month. In the first gallery are the bronzes of the fourteenth and fifteenth centuries, specimens of antique iron-work, the terracottas, &c.; the large central room contains various collections of fans, buttons, silver, pottery, and china; in another room to the right are the beautiful pieces of antique furniture lent by the State from the Mobilier National; while on the other side will be found the collections of stuffs and stuff-designs. In the Costumes Gallery, those of Hungary are especially remarkable, and last, but by no means least, the collections of the works of Messrs. Tissot and Lepic complete this interesting exhibition.

The area within and about the ruins of the Tuileries has now been entirely cleared of the mass of fallen débris with which it was encumbered, and the demolition of those parts of the buildings that still stand has been commenced during the past week. This work can proceed but slowly, owing to the precautions that have to be taken to preserve from injury those fragments possessing any artistic or historical value. The operations, which occupy sixty skilled workmen, have been started on the river front. The central pavilion will be attacked in a day or two. According to the unanimous testimony of those engaged in the demolition, the Palace is a marvel of defective construction. The masonry, with the exception of the facing stones, consists of fillings only, and the interior, so generally admired, is found to be only a common moulding affixed to the rough stones, instead of being carved from the solid block, as everyone supposed. It is rumoured that an Anglo-American company has purchased the Pavillon d'Honneur as it stands, with the intention of removing and re-erecting it in the Crystal Palace grounds at Sydenham, while the *torchères* (figures holding lamps) of the Salle des Maréchaux have certainly been bought by the Russian Government for the St. Petersburg Museum.

The agitation against the excessive rentals of the French capital certainly possesses the justification proceeding from the reality of the grievance against which it is directed, although many of the suggestions advanced for the remedying of the evil are purely chimerical. In the Bourse quarter, for instance, it is impossible to find any shop at a less rental than 15,000 to 20,000 frs.; near the new General Post Office a small café on the ground-floor at the corner of the Rues Montmartre and Etienne Marcel is let for 22,000 frs.; at the corner of the Rues Montmartre and St. Marc another publican has to pay 25,000 frs. also for a very small space on the ground-floor; at the corner of the Rue Vivienne, on the Place de la Bourse, a shop has just been opened for the sale of foreign cigars, and the proprietor has taken a lease at 20,000 frs.; while close by an English drinking-bar is being

fitted up, which will commence business weighted with the enormous rent of 30,000 frs.

At the last sitting of the Commission of Historic Monuments, the President, M. Antonin Proust, drew attention to the fact that the sums allotted in the annual budgets for the preservation and restoration of these monuments were already entirely pledged up to the end of 1885, *i.e.* nearly three years ahead. Important works are in course of execution in fifty-two departments, without counting Algeria, for which a special credit of 50,000 frs. is required, or conservation of the megalithic remains, to which the Commission has to devote 30,000 frs. a year. Further, the new Trocadero Museum must be endowed with at least 100,000 frs. per annum. Under these circumstances the Commission decided to appeal to the Government either for a considerable increase in the yearly subvention, or for the grant of an immediate and extraordinary sum to enable it to carry out the work undertaken.

The collection of M. Nadault de Buffon, the descendant of the great naturalist, will be offered for sale on the 13th inst. It consists chiefly of works of art of the eighteenth century, and includes many paintings and pieces of furniture presented to Buffon by Louis XVI., the Marquise de Pompadour, Marie Antoinette, Catherine II., Joseph II., Paul I., and Frederick the Great. Among the paintings are two fine portraits of Buffon and his wife, by Drovais, which are said to be the only authentic ones extant, and are mentioned by Diderot in his "Salons du dix-huitième siècle." There are also works by Teniers, Bourguignon, Greuze, and much Sevres china, presented by Marie Antoinette, &c.

HABLOT K. BROWNE.*

IN these days when many men discourse mellifluously on the arts, and a new dialect has been invented to do justice to the emotional nature of our younger critics, when a vast amount of dogmatic and flamboyant writing pervades our magazines, our newspapers, and our reviews, when high-minded young ladies dress up to their drawing-room wall-papers, and good people live up to blue tea-pots, a plain man, speaking in a plain language about the simple old-fashioned arts of the past generation, will probably seem flat and dull, perhaps even uncouth and archaic from a neglect of the proper transcendental adjectives, and some apology may be almost necessary for his intrusion into the sacred arena of culture and criticism. But I derive some courage from the discovery, made after many observations, that the majority of these gentlemen who lay down the law in honeyed cadences about the province of art in human life and the reaction of yellow ochre on the soul, are not always comprehensible, even to themselves, not to mention their readers, and are for the most part quite innocent of any capacity to practise the arts which they so eloquently define and expound. I also derive courage from having lived sufficiently long in the world to see that fashions in the arts and their critics undergo change, and to have observed that the most eloquent prophets of one decade go to the butterman in the next. I am sanguine enough to hope that my subject may have attracted a certain proportion of old-fashioned people to whom a less transcendental, not to say less "high falutin," mode of treatment than is at present in vogue may not be unwelcome.

In consonance with that idea I will ask you to take the unusual course of endeavouring to understand what we are talking about. Let us, as far as possible, define our position and arrange our standards, so that we may be in agreement, and I may not be talking about one thing while you are thinking about another. One of the most grievous errors that can be made in criticism is to form a judgment on any artist—whether he be painter, actor, writer, or musician—without understanding his aims and intentions, without taking account of the influence of his age, surroundings, and circumstances. Now any superficial acquaintance with the graphic arts shows that artists naturally fall into two broad divisions. First, the men who paint the visual aspects of things: men who delight primarily in the colour, form, and texture of objects. They may be satisfied to paint things as they are, in a pure spirit of imitation, like Gerard Dow; or they may seize upon the colour, as did Titian; or delight in the beauty of line as did Raphael, or in the subtlety of modelling as did Ingres, or in delicate gradation of tone as did Corot. To these men the glow of colour, the play of light and shade, the balance of chiaro-oscuro, the harmonious accordance of graceful lines, or the tonic relations of values will be all sufficient. But to the second class these purely visual properties of objects must be associated with some intellectual idea—they look upon form and colour not as the final end of their art, but as vehicles for the expression of mental or emotional impressions. These men are stimulated to paint not by a delight in scarlet or azure, but by their interest in human action, passions, and emotions. They

regard human beings as the actors in the great drama of life, not as so many models for the studio. They paint not so much for the sake of painting, as for the purpose of recording the scenes and incidents to this drama, tragically, pathetically, humorously or grotesquely, according to their mood or their prevailing tone of character.

The first class are painters pure and simple—specialists. But in the second, painting is united with a form of literary activity. Although artists, and expressing themselves by the brush rather than the pen, they may be endowed with the dramatic faculty, or the power of story-telling, or even of making puns and jokes. And observe that this literary faculty is an integral and essential part of their artistic character. The story or idea permeates the drawing, and often great pictorial sacrifices are made in the attainment of the desired end. These men are frequently less accomplished in technical matters than the more genuine painters; indeed one of the greatest ornaments of English art (Blake) expresses himself with scarcely more knowledge of the grammar of art than a schoolboy with a slate and pencil. In this latter class we place a group of men, who, from the beginning of the century till within some ten years past, have afforded us great amusement, instruction, and delight—Cruikshank, Seymour, Leech, Richard Doyle, and Hablot K. Browne. These men, differing in many things, have all a common aim and impulse in their art. They all desire to express themselves rather than to represent objects. They desire to arouse in the spectator the same sensations that scenes or incidents have aroused in them. They are less concerned with truth to natural facts than with the expression of their ideas. Their representation of objects is often purely symbolical, and by no means in accordance with scientific accuracy. Indeed, the detailed study of nature as we understand it did not exist. People had not begun to take the world or themselves seriously. The age had its ideal—every age has. In art its true ideal was a development of the romanticism of Scott—a romanticism partly picturesque, you will remember, but leavened and sweetened by a hearty delight in human character and natural scenery. Its false ideal was classical, borrowed from the French. We thought we admired Greek art, and we erected hideous square boxes, with six or eight columns and a portico, because we persuaded ourselves that the Parthenon was the proper model for Christian churches. Our public men who had the misfortune to have statues awarded them were represented in togas, and with legs uncovered by those garments without which respectability (south of the Tweed) never appears in public.

You will find in Browne's work both these influences plainly visible. His natural impulse was towards picturesque and romantic treatment of subjects. But the taste of the age influenced him, and we find a strong leaning towards classicism. Whenever he intended to do something particularly good I think he turned towards Lempière, although the real constitution of his mind, apart from educational influences, was essentially Gothic. He very closely resembled in many respects the remarkable genius with whom he was for years associated; but Dickens was entirely unaffected by scholastic education. He was his own educator, and fortunately for the world his enormous ability was allowed to develop itself without hindrance from conventional ideas or academical prejudices. He was probably one of the most genuine natural types of his age, as well as one of the greatest. What do we find? Strong animal spirits; a great deal of boisterous fun; a true Gothic love of contrasts, the grotesque being placed beside the beautiful to heighten the effect; a vivid imagination, enabling its possessor to recall and reproduce the scenes, incidents, or characters necessary for his work without effort and without aid from book, place, or model; a scintillating and delightful fancy, which enabled him to decorate his work by magically bringing the commonest inanimate objects into relationship with the human element. In all these characteristics, partly personal and partly due to the influence of the times, the two men agreed. Probably no such close mental correspondence between author and illustrator has ever occurred. "Pickwick" was originally projected as a publisher's speculation. The original intention was undoubtedly to rely as much on Seymour's reputation as on Dickens's humour, which had been faintly but surely adumbrated in the "Sketches by Boz." Seymour was a Cockney of the Cockneys—a humourist of a broad, good-humoured, coarse, rollicking type, thoroughly well acquainted with the manners and customs of the town. He had established a reputation as the delineator of the embarrassments of the Cockney sportsman, and he was undoubtedly the originator of the early history of Winkle and Tupman. Dickens had scarcely fired a gun in his life. But the shrewd publishers foresaw that the humourist who could describe the election of the beadle might be trusted to make fun of a group of Londoners wandering into the country on sporting bent. How successfully the two coadjutors performed their task is now a matter of history. The lamentable death of Mr. Seymour on the completion of the third or fourth number (I am writing without means of reference) created a panic. A wreck was anticipated. Jury masts were rigged, but leeway was made. An illustrator was wanted. Among others, two young men who were flirting with the muse of painting offered specimens. One was Thackeray, the other Browne. Thackeray was, I believe, the ambassador, and, fortunately for himself and us,

* A Paper by Dr. Edgar A. Browne, read at a conversazione of the Liverpool Art Club on Monday evening.

the defeated candidate. The two competitors supped together when the decision was made known.

The success of the new illustrator was immediate and pronounced. From within a few months after the appearance of his first plate in "Pickwick" the greater part of his time was occupied in illustrating books. Some, like the works of Dickens and Lever, inspired him with interest: but more frequently he had a sort of good-natured contempt for his authors, and the task of illustrating them was a weariness to the flesh. He had no intention of becoming an illustrator. He adopted the pseudonyme by which he is so well known in order to conceal his identity. But he rose into popularity suddenly. He was besieged by commissions from all sorts of publishers and authors. Like most young men (and he was but a lad of twenty when he became famous) he did not see the evils of early success. He never at any time was able to say "No." And against his own will, against his intention, and in spite of the promptings of his own genius he drifted into a groove, and never was able to get out of it. Many of you may have formed your idea of an artist's life from novels, or those picturesque glimpses which the present practitioners of the art nowadays afford us. But in the old days of which we are speaking artists bore a singular resemblance to other men—in fact you could not tell one from the other. I have known a great many in my time, and they were astonishingly like the cotton brokers and ship-owners with whom I have since become acquainted. They went to their work in the morning, and became hungry for their dinners in the evening, just like common men. In those days they knew nothing of the mission of art, and if they were offered work they took it. Hence it came about that Browne, having scored a success, and having a very modest estimate of his own importance, was sucked into the vortex of the publisher's maelström. Day after day commissions flowed in—all sorts of books were illustrated, the majority quite worthless. A few copies only survive to gladden the hearts of collectors and second-hand booksellers. But taken as a whole the work was a waste of energy. Occupied with the regularity of a man in an office with the production of routine work, he had no time to cultivate his talents or acquire technical information.

The taste of the age required vigour rather than correctness, and so Dickens, naturally one of the most truthful of writers, heightened his effects by an amount of caricature that to us is fatal. Browne followed suit. At first he copied the method of Seymour as nearly as he could, but very shortly his individuality asserted itself. The first illustration showing that a master had come to the work is that of Mr. Tony Weller and his brother coachman drinking Mr. Pells' health. I am not acquainted with any drawing of fat men quite so subtle in discrimination of abdominal curvature. What is the secret of his enormous success in his time? In the first place what I have suggested—the introduction of subtlety into broad caricature. It was new and entirely his own, and is due to the fact that he was by nature a seeker after beauty, and only by malice prepense a caricaturist. In the second place, he had a perfectly unique power of drawing a definite, distinct, and wholly unexpected character, and maintaining the individuality of that character all through the book. The faculty that enabled him to do this is not purely artistic—it is dramatic. It is essentially the same faculty as that of the actor. It requires in both cases a clear, vivid conception of a character. Granting the imagination sufficiently powerful to accomplish this feat, its presentation becomes a matter of detail. The actor imitates by means of facial expression, gesture, tone of voice, and well-chosen costume the character that he has seen with his mind's eye. The draughtsman—the imaginative draughtsman—sketches the character that he sees in exactly the same manner as the unimaginative draughtsman works from a model. The faculty is at the basis of all fine acting, and those endowed with it generally become actors. It is not common among artists, and few have possessed it in so high a degree as Browne. We must remember the circumstances under which the productions were produced in order to estimate his power. He had not the whole books and the completed character before him, but merely a few lines, sometimes in MS., and not always exactly those which were afterwards printed. The work was always done in haste. Dickens was frequently late, and Lever invariably so. He generally took a day over each plate, making the design and etching it on the steel himself. The little pencil and charcoal sketches were merely as guides to the position of his figures (about which he was very particular). Those humorous little touches by which he made the furniture contribute to the general effect of his picture were often added during the progress of the etching. On the artistic value of these etchings I prefer to let others speak.

If I have succeeded in making myself clear, you will understand by this time how his great success in the department of periodical art prevented his true development. Not only did it absorb his time and energies, but it had an injurious effect in stimulating him to seek short and easy ways of expressing himself. His great facility and wonderful memory for all sorts of action, whether of men, horses, or dogs, still further tended to divert his mind from the necessity of study and observation. His shy and retiring habits caused him to shun the assemblies of artists in schools; and so it came about that he never really had any technical instruction

after his boyhood, and then only of a desultory and imperfect character. But drawing in some shape was a necessity of his nature, and his prolific and inventive mind could not long remain satisfied merely to interpret the thoughts of others.

I have pointed out how his humour, as shown in his illustrations, was in accordance with the taste of his time. But I would draw your attention now to his natural humour, which is of a totally different quality. It is quite distinct from the humour of the merely funny man. It is almost always accompanied by an under-current of sentiment, and generally by a didactic purpose. Look at the engraving *Labour in Vain*. A poor old blind man has wandered to the gateway of a long-deserted house. The walls are in ruins; rank and tangled herbage has grown over the broken steps, and twined about the heraldic monsters that crown the gateposts. The blind man's dog crouches in a corner and watches his master uselessly playing on his battered clarinet with an expression of sulky contempt impossible to describe. Now observe amidst the weeds is the fragment of a sundial bearing the word "ruit," and from the broken board we learn that the name of the desirable family mansion is "Paradise House." Here is a glimpse, plain to all who know the man, of his peculiar mode of hinting at the deeper truths in a grotesque manner. It is a variation on the old, yet ever new, theme of the vanity of human wishes. Vain is our playing, and deaf the ears we essay to please only too often, and blind are we to perceive that our paradises are only heaps of worthless rubbish. That all things are equalised by time and death seems to have been an abiding idea in his mind. We see it here in one of his earliest works; it is indicated in his latest. Look at the design called the *Book of Science*. It is a design full of the wildest caricature—literature, astronomy, geology, chemistry are symbolised by the most grotesque and humorous figures. But at the bottom is a heap of litter, wherein we find a pope's tiara, a broken crown, an old shoe, scientific instruments, all now of equal value—that is to say, none at all. Laugh! He will make you laugh. He will dash off pleasantries for you with a few touches of chalk and a slight wash of colour, such as the *Toper's Guardian Angel* or the *Serenade on a Post*. He will take you and show you the happy and beautiful side of childhood. He will amuse you frankly and cheerfully with the mishaps of the hunting-field. But always he seems to return to the old, old morality. Life is a drama, more a dream than a reality, and the grisly hand is always there to let down the curtain upon us poor actors. Those who have watched a beloved life ebb away, and have experienced the helplessness of human learning, skill, and science in the presence of the Great Master will best appreciate the beautiful lessons on this theme which abound in this gallery. He was a professional jester, and wore the cap and bells, but beneath his mirth was a deeper meaning, and he seldom makes a joke without preaching a sermon.

THE WALKLEY MUSEUM.

MR. RUSKIN in a letter says:—The resumption of former duties at Oxford does not in the least mean my abandonment of any plans relating to Sheffield; and the placing of objects recently bought for the Walkley Museum or of gifts made to it (as the beautiful collection of shells especially referred to by the Misses Brereton), temporarily at Nottingham, or at Whitelands College, is only to make these possessions in the meantime as useful as they can be, while they also remain under the charge of members of the St. George's Guild, to which body the Walkley Museum and its contents belong; but also I have always stated that the use of the museum at Sheffield may be permanently increased by the consistent distribution of its duplicate and redundant treasures to other centres of education. The mountain-home of the museum at Walkley was originally chosen, not to keep the collection out of smoke, but expressly to beguile the artisan out of it. Pictures and books may be guarded in Sheffield as in London, but I wished that the sight of them might be a temptation to a country walk. When I was last at Sheffield, however, I expressed my entire willingness to comply with the wishes and defer to the judgment of the masters, whose regard for the instruction and advancement of the operative is now entirely kind and eager. The legal difficulty in the matter is ultimately reducible to that of retaining in the hands of the St. George's Guild and its master the arrangement and, in subsequent purchase, selection of objects which nevertheless are secured as the permanent property of the town. This right of arrangement and selection is essential, but we are ready to guarantee the quite inviolable possession by Sheffield of every object once placed in the museum. For the rest, all delays and dubitations in the business have been chiefly the results of my own illnesses or ignorances, and I hope that with my now clearer knowledge of what is required, and health, to appearance, re-established, and the help of many kind and prudent friends, whatever was right in the design may be soon accomplished.

The Grocers' Company have contributed 500*l.* to the fund for the restoration of Peterborough Cathedral. The subscriptions have reached about 12,000*l.*

NOTES AND COMMENTS.

THE promoters of the Manchester Ship Canal have been successful in obtaining a dispensation of the Standing Orders of the House of Commons. The point involved was a curious and important one. The direction of the proposed canal was not defined on the Parliamentary plans in some places, especially where the river Mersey was affected. The reason for the omission, which was without precedent in Parliamentary engineering, was that it was difficult to say how and in what course the low-water channel should be made, especially when the interests of the owners of property on the banks had to be considered. If time were allowed, the proposed course could be laid down; but as about two years would be required, the delay might be fatal to the success of the scheme. The Committee were unanimous in agreeing that the Standing Orders might be dispensed with; but it is on the condition that a clause is omitted by which the promoters sought for powers to dredge, scour, open, deepen, widen, straighten, cleanse, and improve the beds, banks, shores, and channels of certain parts of the river Mersey.

THE competition for the proposed church of All Saints, Ipswich, which is not to cost more than 7 $\frac{1}{2}$ % per sitting, or complete and with a tower 5,600 $\frac{1}{2}$ %, has attracted no less than eighty-five designs, which are to be examined by Mr. EWAN CHRISTIAN. It may be assumed that the cost of the designs has been about one-third of the amount which it is proposed to expend, yet the value of the prize to be carried off does not amount to 300 $\frac{1}{2}$ %. It is asserted in one of the local papers that the committee have at present little or no money in hand, and therefore the laying of the foundation-stone may have to be long delayed.

THE subject of the proposed bas-reliefs for St. George's Hall, Liverpool, was brought before the Liverpool Council on Wednesday. The Finance Committee had recommended "that Mr. STIRLING LEE be engaged to execute one of the bas-reliefs at St. George's Hall on the following terms, viz., 500 $\frac{1}{2}$ % to be paid to him in case he is not engaged to execute the remainder of the reliefs, and 450 $\frac{1}{2}$ % if he is so engaged, the work to be executed in Istrian marble," and the sanction of the Council was asked for. It was explained that in the negotiations with the sculptor it had been agreed that only one bas-relief should be executed at present. But if all the bas-reliefs were carried out, the cost would be between 4,000 $\frac{1}{2}$ % and 5,000 $\frac{1}{2}$ %. The price named is moderate, considering that twelve large spaces about 6 feet square will have to be filled with figures about the size of life. But the fear of expending a few thousands on sculpture was too much for some members of the Council, and a strong opposition was raised to the proposal. Eventually the consideration of the subject was postponed for a month.

It is satisfactory to find that two artists who have had very large experience in illustrating books have testified to the great merit that is displayed in the drawings of the late HABLÖT K. BROWNE, which are now on view in Liverpool. Mr. CHARLES GREEN writes: "I was a few years ago asked to illustrate the 'Old Curiosity Shop,' and never did I feel I was undertaking such a difficult task when I felt I was coming after what had been done so exquisitely before." He believes that there is nothing to come up to the illustrations of DICKENS and LEVER, not only for character and humour but for intense pathetic feeling. Mr. F. BARNARD says: "However repulsive and even squalid the subject may be that 'Phiz' chooses, there is always the same charming under-current of graceful composition. In everything he touched you can always feel that a keen sense of beauty was at the bottom of it. It comes all the more charmingly from his pencil, for it appears so thrown out in an unconscious and spontaneous manner. This particular sense of beauty of composition, which lies at the root and is the very grammar of all arts, the rarest gift and the most difficultly-learned task of all, seems to him perfectly natural. It never obtrudes itself, but it is always felt." The exhibition of HABLÖT BROWNE in Liverpool has been most successful, and the

interest of it will be increased by the charming paper written by his son, which was read at the Art Club on Monday. It is understood that the drawings will be soon exhibited in London, and they are sure to be welcomed by the crowds for whom "Phiz" created so many characters that are likely to be immortal.

A REMARKABLE return has been prepared by the Metropolitan Board of Works. It shows the total amount of works executed by the Vestries and District Boards of the Metropolis from the beginning of 1856 to March 25, 1881, the expenditure on those works and other information relating to them. During the period between 1856 and 1881, 919 miles of new sewers have been constructed, at a cost of 2,310,890 $\frac{1}{2}$ l. In addition a sum of 2,162,769 $\frac{1}{2}$ l. was expended on other sanitary works. Paving was more expensive—11,745,875 square yards were laid down, which cost 5,535,073 $\frac{1}{2}$ l. Street improvements of other kinds cost 1,504,831 $\frac{1}{2}$ l. The total expenditure is consequently 11,513,565 $\frac{1}{2}$ l. But in reality it was more, for the returns from some of the districts are incomplete. In 1856 the length of streets and roadways under the control of the vestries was 925 miles; it is now 1,607 miles, showing an increase of nearly 700 miles. The number of lamps added since 1825 is 26,444.

SOME experiments have lately been made at Leipzig with a new system of joint for casement windows, invented by Herr DRESSLER, of Zeitz. A small-sized model of a casement was kept, during a fortnight, covered with about three inches of water, and not a drop passed through. Wherever the joints occur—that is to say, all round the window and between the two sashes—grooves are made, in which indiarubber tubes are inserted, which are slightly compressed when the window is closed. The tubes do not in any way interfere with the shutting of the window, and may be taken out in summer. This system is assumed to be a cure for the draughts caused by defective joints, due to the shrinking or warping of the wood, and is found to exclude wind, rain, and dust.

MR. J. J. BATEMAN, the president of the Birmingham Architectural Association, has issued an appeal asking members of the profession to help, by annual subscriptions and the use of their influence among their pupils and students, in extending the usefulness of the efforts made by the association to advance architectural education. There are about ninety practising architects and upwards of two hundred students in Birmingham, and if one-half only of this number became members the association would be enabled to provide more suitable classrooms than those now occupied in the roof of Queen's College Buildings, which are very inconvenient and ill-lighted. The committee would also be able to engage eminent lecturers, extend their prize list, and afford other advantages for the students which the funds at present at the disposal of the committee do not enable them to accomplish.

AN improved hydraulic curtain for preventing the spread of fire in theatres was exhibited to some members of the Edinburgh Town Council on Tuesday by Mr. WILKINS, the fire-master. The sides and bottom of the shutter are made of strong steel or iron, forming the frame proper, to which the plates can be secured either by welding, rivetting, or bolting. Provision is made to prevent the shutter from warping if exposed to heat. A tank or cistern requires to be placed in a convenient position higher than the top part of the shutter, or may be supplied with water direct from the town's main water-pipe. Supply pipes are carried down from the cistern to the shutter, which slides on these on the telescope principle. By means of a chain or rod connected to a valve in the tank, the shutter may at once be filled with water, a stopcock being placed in the lower part of it to allow the water to be run off at pleasure. The shutter travels up and down a groove, which is made in such a manner as to guard against the possibility of either smoke or flame getting through to the part of the building in front of it. A windlass of a particular construction is made for raising and lowering the shutter at will, arrangements being provided for its being lowered either slowly or instantaneously.

WELLS CATHEDRAL. NORTH PORCH.

SALISBURY CATHEDRAL. WEST PORCH.

THE two illustrations from the cathedrals of Wells and Salisbury are reproductions of two pencil drawings by Mr. W. R. LETHABY, which are models of architectural sketching.

NICHE AND FIGURE, LUDDENDEN CHURCH.

THE niche shown in the illustration is built into the western face of the chancel wall of Luddenden Church, near Halifax, and is the gift of Mrs. WILLIAMS in memory of her parents. The figure of the angel is 4 feet 4 inches in height, cut from a block of perfectly white marble, and is the work of Mr. J. E. BOEHM, R.A. The design and details are drawn by Mr. W. F. BARBER, of Halifax, Yorkshire.

PRIMITIVE METHODIST CHAPEL, FOREST HILL, S.E.

THIS chapel has recently been built in Stanstead Road, Forest Hill, from the designs of Mr. J. W. BROOKER, architect, 2 Railway Approach, London Bridge, S.E. The contract was taken by Messrs. STEED BROS., at 1,130*l*. Accommodation is provided for nearly 400.

KIRKSTALL ABBEY.

THE restoration of Kirkstall Abbey is by Mr. CONNOR, F.R.I.B.A., and illustrates a paper by him, part of which is printed below.

KIRKSTALL ABBEY.*

By J. WREGHITT CONNOR, F.R.I.B.A.

THE first abbey belonging to the Cistercian Order that was founded in Yorkshire, and I believe in England, was that of Rievaulx, near Helmsley, the second that of Fountains, near Ripon, and Kirkstall was the third. Kirkstall was an offshoot from the abbacy of Fountains, and owed its foundation to a somewhat common incident at that time—a vow on the part of a rich nobleman, Henry de Lacy, Lord of Pontefract, to endow a monastery if he were restored to health. He promised the district of Barnoldswick in Craven for the support of a monastery of the Cistercian Order, and here, in 1147, Alexander, late prior of Fountains, and now abbot of the new establishment, settled down with twelve monks and ten lay brethren, so small and insignificant was the commencement of the great Abbey of Kirkstall.

For how many occupants the Abbey was originally planned we have no record, but I should consider it possible, from a comparison with other similar institutions, that, when completed, it would be inhabited by 100 monks, and, perhaps, twice that number of lay brethren.

The plan of the Abbey in its present condition—which has been prepared with the greatest accuracy by Mr. Hobson, and which, to his credit be it said, is I believe the only correct plan in existence—does not in many particulars afford a true impression of the buildings as erected in the twelfth century. Extensive additions were made at a later period, and some portions of the original structure were afterwards pulled down and rebuilt on a different scale. These changes make the plan, to a certain extent, useless as a guide to the arrangement of the Abbey in its first condition, and I have prepared a conjectural restoration of the original plans, supplemented by a bird's-eye view, so as to present in a graphic form a good idea of Kirkstall Abbey in 1190. Of course imagination has had to play a part in these drawings, especially in the case of the view. Wherever there has been no existing remains to restore the elevations from, precedent from other Cistercian abbeys has been followed; so that though the scene may not be absolutely correct in all its features, it certainly may be relied upon as being as nearly truthful as care and minute examination could make it. With the exception of one or two points where some little doubt still exists, the plan may be accepted as quite correct.

First in importance, as in date, comes

The Church.

This, like all others of the Order, was dedicated to the Virgin Mary, and was erected before the devout monks thought of providing any permanent shelter for themselves. The rudest of wood shanties sufficed for them to live and sleep in during the years of the church's erection. It was only when the house of God had received its final crowning cross that these earnest devotees turned

their attention to matters of, not personal comfort, but, indeed, of personal necessity. The building consisted of nave, north and south aisles, aisleless transepts, chancel, and six chapels, three on the east side of each transept. To what saints these were dedicated is unknown, as no canon governed this as was the case with the church. The arrangement of the plan was dictated by a rigid rule, which made it imperative that it should be based on the form of the cross. All Cistercian abbey churches of the same date are alike in this. Later, when a passion for grandeur crept in, this principle became less strongly marked; but the earlier churches invariably show it. In the case of Kirkstall, where the low roofs of aisles and chapel are left, the nave, chancel, and transepts form a Latin cross of the exact proportions of the one I have drawn on the plan before you. This was not merely the result of accident or convenience, but of design, and was done according to the directions of a charter drawn up by Stephen Harding, and with a deep and reverent symbolic meaning. The directions contained therein also demanded that churches attached to this Order should be marked by great simplicity and severity, and should avoid all excessive ornament. Only one tower was allowed, and that an extremely low and modest one. The lantern at the crossing of Kirkstall in its original condition was no higher than is shown on the bird's-eye view; the upper stages were raised at a much later date, and the ambition of the abbot who did this is answerable for the ruin of the church, as the piers on which it stood, not being calculated for so heavy a burden, gave way in 1779, bringing down two sides of the structure. Curiously enough, the destruction of this revealed several smoking pipes embedded in the mortar, showing that Englishmen smoked something or other long before Raleigh brought them tobacco, for it was evident, from the position of the pipes, that the workmen had been indulging in a whiff or two when the master of the fabric came round, and probably, to conceal their delinquency, the guilty labourers sacrificed their beloved pipes to escape the consequences of detection. In this tower only one bell was allowed, in place of the peals that rang out merrily from the belfries of other churches. The date of the additional belfry stage, as of most of the additions to the Abbey, would be about the end of the fifteenth century.

The side-chapels were covered with a simple barrel vault, the chancel and aisles were groined, the nave and transepts covered with a wooden roof. The vaulting remains in a more or less perfect condition, but every vestige of woodwork has disappeared. A noteworthy feature in the groining of the chancel is that the great arch opening into the nave is higher than the vault behind it, the two being connected by a deep cove; the effect being very bold and striking. Another point to be observed is that whilst all the small arches are semicircular, and the moulds and all decorative features purely Norman in type, the whole of the great structural arches are pointed. This is noticeable in other Cistercian buildings, and shows that the Order were amongst the first to introduce the Early English style. In the ornament of their churches the Order was prohibited the use of the human head and figure, and this class of adornment, so very common elsewhere, is altogether absent from Kirkstall Abbey. Painted glass was not allowed for their windows, and, indeed throughout, great severity of design was enjoined. The Cistercians were the Quakers of the period, and scorned the pomp and display of other bodies.

During service the monks occupied the choir, at least the south transept, the crossing, and probably two bays of the nave. This portion was screened off from the rest of the church by stone walls, of one of which the foundations still remain. A beautiful arcaded gallery in the south transept, above the dormitory, provided room for sick monks, who thus were enabled to attend service and join actively in their brethren's devotions without undergoing the fatigue of descending the staircase. To have done so necessitated extraordinary physical exertions, for the daily routine of religious exercises required that the monks should have services at two in the morning, at six o'clock, at eight, at eleven, at two in the afternoon, at six, and lastly, at eight in the evening. As each of these were supposed to last about an hour, it will be seen that no less than seven hours daily were spent in the church.

The lay brethren occupied the west end of the sacred edifice, and, out of consideration for the hard work they had to do, were only required to attend two of the services—at five in the morning and eight at night—except on Sundays and holidays, when, by way of relaxation, they had them all to attend.

The centre of the church was devoted to the use of visitors, or the inhabitants around, who were not attached to the Abbey in any direct way.

To what extent the three portions of the congregation were divided by screens, it is difficult to tell. It is generally supposed that the divisions ran much as shown on the restored plan. Those separating the aisles from the nave were in stone, probably unpierced, but how far they extended, or whether the whole length of church, cannot now be traced. They may have gone as far as the last pier but one at the west end; if it be any guide that, to this point, all the bases are square towards the nave and splayed towards the aisles. The preacher in the twelfth century, most likely, made use of no pulpit, as this feature of a church only came into general use a century later. His place, on ordinary occasions, would be about the centre of nave. It is likely, too, that there

* From a paper read before the Leeds Architectural Society. (See Illustration.)

were several altars along the north and south walls, but of this we have no evidence.

One of the north piers of nave arcade affords a curious example of the Cistercian objection to ornament. Here we find the junction between the circular nave mould and the square sub-base emphasised by a beautiful example of interlaced work, evidently contemporaneous with the erection of the church. The other three angles are roughed out for a similar adornment, but the veto against decoration appears to have gone forth, for they are left in their unfinished condition, and no attempt has been made to place anything of the kind on any other of the pier bases. Internally, the building has always presented an appearance of severe simplicity, whose plainness has been more than redeemed by the correct proportions and stern grandeur of the varied features.

Externally, with the exception of the west end and the north-west doorway, the same restraint is shown. The exceptions are remarkable. Nothing of the period can excel the richness of the west elevation, with its magnificent doorway and its deeply recessed and moulded windows. There is evidence of the great windows having been surmounted by a semicircular arch, having the enclosed centre filled by a marigold opening. Such a finish must have given additional effect to a front exceptionally beautiful. In its first condition this front, as well as those of transepts and choir, were without the angle pinnacles and centre ornaments. The roofs, too, were of a steeper pitch. These were, no doubt, added at the time when the ridge of roof was lowered, at the end of the fifteenth century.

At the end of south transept was placed the sacristy. This was a plain barrel-vaulted apartment, with recessed aumbries and double outer doors. At one end a small cell has been formed, by building a wall across, which has much exercised the experts. Some have held that it was a receptacle for the dead, others a penitentiary; others, again, that it was a treasure-house for holding the valuables of the monastery in special security. There is the strongest internal evidence of its being none of these, but that it has always formed a part of the sacristy, the division wall being a modern one, erected for the sake of building a fireplace against it, and forming a comfortable little arbour for the use of picnic parties. The mistake has, I imagine, arisen through the vault of the sacristy having had to be lowered considerably at the west end, in order to pass under the staircase leading from the monks' dormitory to the south transept. The clear difference thus established has seemingly suggested the position of the division wall, and so brought about the formation of the cell which has given rise to so great a display of acumen and so much expenditure of ink. The staircase I have alluded to, being at some little distance from the west wall of the dormitory, has enabled the builders to form a small vaulted secret chamber, lighted by a narrow slit scarcely noticeable from the outside. Here, it was supposed, the monks concealed their valuables when a raid was anticipated on the part of the Scots, who then, as now, preyed upon the English—then by force of arms, now by strength of head.

Outside, to the north of the sacristy, was an arched recess, which might have been a closet for the reception of the books used in the services of the church.

To the south of the sacristy came the chapter-house. This was perhaps the most highly-decorated part of the monastic buildings. Every day the monks met here to confess their several misdeeds, and to have due punishment meted out to them by the abbot. Here, too, with an appetite for religious exercises altogether insatiable, they were preached to, or lectured at, as the case might be. The lay brethren, who were devoid of literary tastes, met in chapter but once a week, and preaching seems to have been so little to their taste that sleeping during the sermon was a common complaint urged against them. In this room all elections of officers took place, all the business of the collective body was transacted, and here all processions were marshalled. After the church no room was so important as this, and no other played so prominent a part in the history of the Abbey. "There is no place," said one abbot, proudly, "that the devil hates so much as this. Here souls are reconciled, here our penances are performed, our offences punished." "No wonder," was the unkind retort, "that the devil hates the place where so many of his children are whipped."

In chapter the abbot was seated in the centre of the east end; the monks down each side. The lay brethren probably stood in the centre, or outside in the cloister. It is supposed that the great arches at each end of the apartment were perfectly open, and that winter or summer the monks were without any protection from the weather, beyond that afforded by the vaulted roof. The bodies of abbots and benefactors were buried in this part of the building. Where the departed monks and lay brethren were laid is a matter of uncertainty; some authorities say in the cloister garth, others that a cemetery at the east end was provided for them.

The size of the chapter-house was soon found to be insufficient for the accommodation of those who desired to use it; for the first addition made to the abbey buildings was the extension eastwards of this room to the area at which it now remains. The passion for originality and the abhorrence of repetition, so distinctive a feature with mediæval architects, was shown in a pronounced feature here; for the double arcade of the original house was abandoned, the addition being groined in one span of about

28 feet, the rise of the ribs being very slight in order to accomplish this without lifting the level of the dormitory floor above, and the outer walls being made very stout to resist the thrust of so wide and flat an arch.

To the south of the chapter-house lay a small apartment, the use of which is problematical. It is generally supposed—probably rightly—to have been the room in which interviews with visitors were held. Some such accommodation would be necessary, and no part of the building seems more likely to have been devoted to the purpose.

Next to this came the stairs to the monks' dormitory. This was groined as far as the wall through which the stairs passed, and under it was a barrel-vaulted cell, which would possibly be the penitentiary in which recalcitrant monks had leisure given them to repent their misdeeds.

South again of this came a passage giving access to the outer grounds from the cloister garth.

(To be continued.)

THE ARCHITECTURAL ASSOCIATION.

THE eighth ordinary meeting of the Association was held on Friday evening, the 2nd inst., Mr. Cole A. Adams, vice-president, in the chair. A vote of thanks was awarded to Mr. Verity in connection with the late visit to the Pandora Theatre.

Mr. W. H. A. BERRY, hon. secretary, said he was sorry he could not announce that any visit had been arranged for the following week (to-day, March 10). If no announcement appeared in the advertisement columns of the professional journals, it would be understood that no visit had been arranged for. Mr. Berry then asked members to be good enough to help the secretaries as far as possible by giving information of buildings suitable to visit. He said it was hardly possible for one or two persons alone always to know of a building which would suit the purpose, but that this difficulty would not occur if the members would help in this direction.

Mr. J. D. SEDDING then read a paper entitled

About Modern Design.

Mr. SEDDING said:—A short while ago I was, in an evil moment, tempted to turn my attention to nineteenth-century architecture in its relation to tradition. The choice of the subject—or rather of the special side of the subject—sprang from an investigation I had previously instituted into the cause of the failings of modern architectural design. The three points before me at the time were:—1. Is our architecture good or bad? To which question I got the short answer—It is generally bad. 2. Why is it generally bad? And 3. What are its prospects of amendment?

The solution of these three points was no easy task, as you may imagine. Darwin's experiment with 6½ ounces of pond mud, which were found to contain 537 seeds of several distinct species, is a mere trifle to the analysis of Victorian architecture. The compound thing I had proposed to resolve into simple parts was not created yesterday, but it was the fruit of the confused labours of two generations; it was not the outcome of the blended purpose of kindred minds set in one direction, but the composite result of revolutions led by hostile minds. It is no wonder, then, if I got little presentable information out of this quagmire of opposed motives, or that I have much to tell about the probable issues.

It would be a misapplication of terms to say that in this little effort of analysis I turned Victorian architecture inside out, because you know it has no inside—only outsides! Just as the humorous foreigner remarked of our climate—"Climate," said he "you have no climate, only weather!" So, by your grace, I am disposed to say we have no architecture now, only design. The "silver streak" of the Gothic revival separates Old English architecture from New English design, and what we call Victorian architecture is really only a retrospective art—an art of plagiarism—an art of odds and ends—an art which is composed of what naturalists might call "illegitimate crosses"—a system of design such as the "wandering Jew" might turn out if he were still on the tramp, as the result of his itinerant notes. If you inquired as to its "tendencies," I think you would see that so dignified a term scarcely befitted its present wabbling motions, for excepting a kind of blind bias towards half a dozen different types of the Renaissance at once, it is really too flabbily constituted to take a steady stride in any definite direction. To say this, however, is by no means to detract from the many excellencies of English design, or to refuse to recognise the vast improvements effected in the last few years. There is no denying the cleverness of English architecture, and I question whether, so far as actual designing power, and so far as range of knowledge and familiarity with historic types goes, there has ever existed so much shining talent in any one country as is at the disposal of the British nation at the present time. In making this remark, perhaps I ought to qualify it by saying that I refer simply to the points of merit enumerated above, and not to quality of design, *quâ* design, nor to the principle of its inspiration. Yes, and I would go yet further and say that even had we Bramante, Peruzzi, and Michael Angelo with us

just now, we should do no better design. We cannot want better architectural designers than many now living in our midst. It is not more talent, or more knowledge, or more invention that we want; it is not even that the times are against our producing first-class art, but it is that we have no tradition to rest upon to give backbone to our efforts. It is all very well for our hard task-masters—the nineteenth century—to demand better bricks and more of them; we could make them fast enough, if only the clay and the stubble were provided.

So far, then, as bare designing faculty is concerned, I am bold to say we could stand the comparison between ourselves and any band of designers of past days. Consider, for one moment, the range of our everyday work. Consider how, at anybody's beck and call, we are called upon to do, and can do, what was demanded of no other architectural designers the world has ever seen; and that is, to design, at a moment's notice, not only in the styles, but in every phase of the styles, of the thirteenth, the fourteenth, the fifteenth, the sixteenth, the seventeenth, and the eighteenth centuries of the English, French, Italian, German, Flemish, and Dutch architecture, to say nothing of having to throw in as a make-weight the adornment of our productions in such world-wide systems of decoration as the Chinese, the Persian, the Cairene, the Pompeian, and the "Early English" (whatever that may mean). Now, I think that even Mr. Matthew Arnold—hard as he is to please—might, for once, be proud of British enterprise if he realised, as I do, the magnitude of the ability and the range of the knowledge of the British architect. It is prodigious! But if we are proud of our child, it must be owned that its equivocal ancestry gives us some trouble in the matter of providing food to its liking; and if it were not for the railways—English and foreign—and the organisations of frequent foraging excursions, I do not know really what we should do. But, joking apart, English architecture is not what it was in old days—the production of English brains. In truth, designers are in that colonial condition of neutral-mindedness and variance with the past, that they might just as well be living in America or in any other scarcely-civilised country, for all the help they get from the store of tradition left them by the fathers of English design. They are little more than the fetchers and carriers of old ideas, which they mend and improve and patch up as the fancy takes them. And men, advanced in years, who have shared in the revolutions of taste of the last fifty years, and produced designs to suit each succeeding page, are not recognisably the same men if judged by their works. The chameleon may be the same lizard, but seen under his changes of colour you would hardly know him. It is not with us as it was with the old designers—say the Italians I have just mentioned—whose work has a uniform style and uniform character throughout, and the periods of whose lines slide into each other, from less to more, as the quarters of the moon into the full moon without sign of separation. And lest any one should accuse me of harsh dealing with a century I so sincerely admire, let me remind you of a few typical examples of nineteenth-century work. Of churches, take All Saints', Margaret Street (1858); of houses, Lowther Lodge (1875); of public buildings, the Houses of Parliament (1845), the recently completed Natural History Museum, and the Law Courts; and my list is not complete without mention of that cockney's joy and marvel of the fishes—the Brighton Aquarium—which I take to be a fresh and supreme type of the versatility of the Victorian era. Will any one tell me which of these typical buildings represents Victorian architecture as Henry VII.'s Chapel or Westminster Abbey or Hatfield or any other old building represents the vernacular of the periods which saw their erection?

I have just said that we could not desire abler designers than we have now amongst us, and I have ascribed the lack of tradition to be the root of all our evils past and present. There is not, so far as I can recall, any single lineally descended type of old English design now in vogue. Everything is new, while nothing is original. Everything began since we can remember. It is competitive fashion and not ideal development that has thus pushed us along at electric speed. Fashion has been the source of our inspiration, and the bond of efforts: break that bond and the bundle of the various phases of our design tumbles to pieces. If we want to see genuine nineteenth-century vernacular, national design, we must go to France or to some other happy land where art has never been pushed adrift from tradition. As for ourselves, if we dared to speak the truth, we should almost say that our minds are vacant of ideas when left to themselves, and that they need the ideas of others to fill the void; one would almost declare that the inward spring of thought was dry, or we should not have these strange omnivorous appetites which make us run about with wide, open mouths, eating all that comes to hand!

These and other reflections of an equally depressing nature forced themselves upon me as I stirred the muddy waters that flow about the bases of modern English design. Most of us have at times felt the irritation of thoughts and views which instinct told us were true, but which we nevertheless let flit vaguely before us without closely following them up to their conclusions. Thus it was with me in this matter. I had long dimly felt all was not right with us. I had a sense of the deficiencies of our work, and the inconsistencies of its sources of inspiration; I knew we had only been eating "angels' food," which we picked up at night and

devoured in the morning. I instinctively felt that we were powerless without this artificial supply from a source external to ourselves. Yet hitherto I had shirked the inquiry, and had tried to bolster up one's courage with dreams of the infinite possibilities of the types in vogue, and had indulged in high expectations of what the inventive genius of this inventive age might evolve. But daring now, for the first time in my life, to walk boldly up to this brave-looking temple of modern art of miscellaneous design, in an evil moment to lift the veil and to look straight into the innermost sanctuary, I confess that I was scarcely prepared to find what I did find therein—only dead men's bones and echoes of the past, but no living voice. Yet in spite of the sad lessons of this vigil of analysis, I am brought among younger men, and am young again and full of hope about the destiny of art and for the share they will take in framing it. But before going further I would advise them (after my own experiences) to try synthesis, and not analysis. The problem is to mend the failings of the nineteenth-century art, to fuse the broken elements, to fix the fluent and to reconcile the far-fetched type, to unite the scattered energies at play, and to shake anarchy into order. We do not want dissection of our present chaotic effort carried out by the cold-blooded hand of the pessimist, much as Izaak Walton fixed his worm, but done mercifully by a sympathiser. We want to know the worst, and yet withal to get our faith in human progress stimulated and revived. We want to feel the self-regenerative power of human effort, when honestly meant, however faulty and misdirected it may be in scope and method. Our dear friend, Mr. Ruskin's, "Oh! the blessed blind men who talk of progress" does not help matters a bit. What we want is to know the bad points, yet recognise to the fullest extent the good points in modern design, and, seeing these, to take heart of courage from them, to magnify them, to make much of them as the bases of future improvement. Having, then, laid down what I take to be the only helpful, healing way of touching the sores of modern design, I will endeavour to follow it in the remarks I am now about to make.

(To be continued.)

MR. AITCHISON, A.R.A., ON THE APPLICATION OF COLOUR TO THE EXTERIOR OF BUILDINGS.

A LECTURE was lately delivered to the students of the Royal Academy by Mr. Aitchison, A.R.A., on colour applied to the outsides of buildings. The lecturer proposed to explain (1) the position colour holds to man; (2) the passionate love mankind have for it, whether it be exhibited in Nature's works or in works of art; (3) the employment by mankind of beautiful things of Nature to adorn their temples or their dwellings; (4) the use of colour in enhancing the beauty of buildings; (5) modern examples of the use of colour.

Mr. Aitchison began by showing how universal was the love of colour. What, he asked, was the exciting cause of "those gilt gawds mere children run to see" but a hunger after colour? Why are painters courted and sculptors neglected? Is it not that the painters deal in colour which all know and love? Landscape-painting is esteemed because it preserves evanescent phases of Nature's colour, figure-painting because it expresses the exquisite and subtle tones of flesh, gorgeous robes, and surroundings. If two of the best-known works of Titian, the *Bacchus and Ariadne* in the National Gallery, and the *Virgin and Child* in the Louvre are analysed, what are they but a collocation of various colours and tones making a gorgeous and enchanting whole? In the former how gorgeous are the orange and blue of the bacchantes' dress, the red-dappled robe of Bacchus, and the pale stars in the blue heavens! The Louvre picture is one of the most sumptuous pieces of colour imaginable; and if superb pieces of colour can be culled from Nature and put on canvas, a building may be substituted for a canvas and made equally superb in colour.

Buildings were not left to the monotone of one material until the last century. Persians, Assyrians, Egyptians, Greeks, Etruscans, Chinese, Japanese, Mexicans, Peruvians, Arabs, Moors, and Turks all enriched their buildings with colour; we may believe that the Gauls, Germans, Scandinavians, Goths, Huns, and Vandals did so, and the group of nations known as mediævals made their buildings striking by means of colour. In illuminated manuscripts and in mosaics we find representations of buildings, and they are shown as wholly or partially coloured. In a painting by Giotto there is a white building with a scarlet cornice, and under it semicircular machicolations, the corbels of which are scarlet too, whilst the semicircular sunk panel over the lintel of the door is filled with geometrical mosaics. Gentile Fabriano shows red walls with black archivolt, red porphyry caps of columns, and veined shafts; and in another work there are grey walls with white lines round the arches, black archivolt, columns all red, and the soffit of a balcony black with scarlet architraves. In pictures by Benozzo Gozzoli, Signorelli, Pinturicchio, and others, we also find evidence of the use of colour in buildings. It was impossible to revive a lost art unless we knew something of that which was done

by artists who have gone before us, and the lecturer hoped that, besides its historical interest, what he said might bear fruit in inducing the students to give attention to the adornment of English homes, and of homes in the colonies and dependencies, in which he hoped some of them might hereafter practice.

Mr. Aitchison said he thought it best to speak of things he had seen; but, although he had not visited Persia, he must speak of it because there was to be found the most magnificent exposition of extreme colour applied externally, and executed, too, in enamelled earthenware, which was a splendid imperishable material. Fortunately, the pattern-books of a Persian architect had been secured for South Kensington. Drawings were exhibited from Coste's work on "The Modern Monuments of Persia," as well as a magnificent tile work from Ispahan. Splendid colour is, as a rule, only to be found in the East, or has been derived from thence; and Mr. Aitchison said he believed that all the finest colour in Europe came, directly or indirectly, from the East. First it filtered through Constantinople, and skilled men were sent from there to execute works in different parts of Europe. The Crusaders enabled the Westerns to see something of the glories of the East, and afterwards the impression was kept up by traders. The effective mode of adornment by horizontal stripes in different colours was evidently brought from the East. Eastern influence was especially to be seen in the decoration of St. Mark's and the Ducal Palace at Venice.

Mr. Aitchison considered that the most striking modern example of external polychromy was a palace in Berlin. Black and red compressed tiles in a diaper face the walls; the dressings of the windows are majolica, and the frieze is of coloured glass mosaic on a gold ground. But when it was remembered that no attempt so complete was made in this country, it was not pleasant to reflect that the tiles were probably English, that the majolica was Minton's, and that the mosaic was from the English company at Murano. Polychromy of a very delicate and dignified character was obtained in the Paris Opéra House by means of marbles, bronze, and gilding, with a very slight admixture of enamelled earthenware on the flanks. M. Sedille is erecting a huge building for the sale of drapery in Paris, which will be another notable example of the use of coloured materials. Two sides are already built. The upper part of each of the towers flanking the façades, built of brilliant white stone, are panelled with glass mosaic on a gold ground. The scrolls of green and blue, with white and purple-brown flowers, form the ground of the owner's names in pure white letters edged with black, and the stone frame to this is enriched with jewels in a gold setting. Each bay between the pilasters is wholly of glass, iron, and bronze, the iron painted dark-grey, and the bronze gilt. Each storey is enriched with a frieze of gold mosaic, and slabs of marble set in the bronze. The roof is of zinc scales. The dormers and the ridge are of cast-iron, painted black, and partly gilt; the turrets above the domes of the towers are gilt, and the balconies supporting gilt festoons. The whole looks brilliant and satisfactory in the Paris sunshine. The front of the Turkish Baths in Paris, designed by M. Parvillée, is faced with enamelled tiles of Turkish patterns and colours. The application of colour to the exterior of London houses had its pioneers, who deserved credit for their courage in endeavouring to manifest that beautiful and imperishable colours were as good as drab. Among them were Hector Horeau, who used majolica medallions in a house in the Avenue Road; S. S. Teulon, who designed the fountain at the corner of George Street, Westminster, now nearly black, but once brilliant in colour; Sir Gilbert Scott, who designed the Albert Memorial; and Sir Digby Wyatt, one of whose works was a shop of iron and encaustic tiles in Gracechurch Street, but which has been removed. Among the metropolitan buildings in which colour was utilised, the following were mentioned:—A bookseller's shop in Piccadilly (figure-subjects in opaque glass), the St. James's Restaurant (mosaics on a gold ground), Messrs. Doulton's offices (glazed stoneware, jewels, and enamels), a shop in Bond Street (faced with encaustic tiles), and a railway station in the Finchley Road (stoneware and jewels, the passages and platforms being lined with white and grey bricks in bands).

A new warehouse in Knight-riding Street is wholly of glazed bricks and iron. The piers are of greenish-white glazed bricks with glazed bands and dark brown plinths. Above, the walls are white with grey bands. Brown enamelled bricks with impressed patterns are used for architraves, string courses, and cornice. The same colour is adopted for the shield and corbel sustaining the angle on the first floor over the rounded corner beneath, while joining the upper and lower windows are frames of grey glazed bricks with moulded edges panelled with brown glazed bricks, having impressed patterns. A warehouse in Moorfields is another example of the adoption of glazed ware. Yellow and red terra-cotta, Victoria and Portland stone, and blue Staffordshire bricks have been employed with dark red glazed bricks, and tiles with large glazed ornaments of a rich brown, and with white and grey glazed bricks. It remains to be seen how far such a variety of materials will work together. Already the terra-cotta cornice of the ground floor is changing from yellow to black. In a third building in the same district the upper part consists of pure white glazed bricks, while the lower is red brick and stone. The contrast is rather startling, but it was dictated by the necessity of avoiding interference with neighbours' lights.

In Lisson Grove there is a warehouse which is a successful example of partial polychromy. It is built of white bricks; the pilasters, strings, and cornices are terra-cotta. A wide band of enamelled tiles, bearing the owners' names in dull blue letters on a white ground, runs round two fronts on the first floor. The letters are divided by the Queen of Diamonds, and where they do not fill up the space a series of upright green scrolls are inserted, the whole being enclosed by white borders ornamented with grey lines and circles, filled in with green leaves and red flowers. But in a few years it is likely to be all out of tone, and the white changed to black. Outside the South Kensington Museum white and yellow glazed earthenware may be seen, and in Springfield Road, N.W., there is a garden wall of brown and red glazed bricks, the capping and gate piers being glazed stoneware.

Two examples of painting were described. One was a shop in Berners Street, having red pilasters ornamented in gold, with gilt capitals; the panels between are imitations of mosaic, and have a gold ground on which the heads of musicians are painted. The second example referred to was Mr. Alma Tadema's house. The front is treated mainly in yellow and white. The porch has yellow columns, with a light coloured Greek ornament on the dark blue ground of its frieze. Two blank arched spaces at the back are treated by white and red lines, and small coloured forms on a black ground. The blank arches have small windows at the top; the splays and heads are left white, and the ornament consists of coloured lines and jewels.

Some other applications of colour were mentioned, such as the sgraffito at the Science Schools, South Kensington, and other places, and coloured stones in offices at Blackfriars; but it was observed that all rough materials soon get blackened in London. There was also a reference to the fashion of painting house fronts in purple-red, but however terrible was the colour, it was to be welcomed as a protest against drab. The problem to be solved is how to redeem the hideous monotony of buildings which in misty weather and in twilight seem to be ghastly white or gray spectres. Owing to the prevalence of damp it is difficult to secure a permanent colour. Even in the country porous materials afford a footing for moss and lichens. But in London and large manufacturing towns colour has stronger enemies—dust, smoke, gases, soots, &c. Partial colouring in glazed materials, in combination with those which are rough and porous, soon loses its tone, and in time the glazed work stands out from the blackened surfaces around it like the teeth of a grinning negro. No marble will endure in such a climate. Already we can see its effects on the Oriental jasper columns of the Grosvenor Gallery, on the breccia columns of a shop in Bond Street nearer Oxford Street, and indeed on any marble slab that is inserted in the front of a building. The only natural materials that will stand are red and green porphyry and some granites. Bronze does pretty well, but glass mosaic, glazed stone, and earthenware are practically imperishable. White tiles when used outside soon perish, owing, it is said, to the moisture absorbed by the porcelain, which freezes in water and bursts the tiles. Brown, pink, and grey polished granites make but a sombre building even when used in conjunction with porphyry and bronze; and, besides, only a nation, town, or very wealthy man can afford the cost of them. Glass mosaic is also very costly, and the gold ground in a dark setting is too light and cold. It should be more of the colour of copper. Enamelled brick is, in fact, alone to be relied upon if the buildings in London and in the large manufacturing towns are to be made clean, gay, and beautiful. It is a material that affords scope for design in colour and ornament. The use of it would lighten streets, and it is economical, for with enamelled bricks tenants would only have to wash the fronts of their houses instead of painting them. The objections against the introduction of glazed ware, on the ground that it was likely to produce bad examples, were met by a quotation from M. Sedille, who said that although there were bad books, yet no one would object to the utility of printing. It rested with architects to create good examples, or at least to select them.

SIR JOHN STEELL'S "ALEXANDER AND BUCEPHALUS."

A PARTY of visitors assembled by invitation at Sir John Steell's foundry in Edinburgh a few days ago, to witness the casting of the principal portions of his group of *Alexander and Bucephalus*, soon, it is expected, to take its place among the public monuments of the city. The work in question, says the *Scotsman*, was designed by Sir John about fifty years ago, immediately after returning from Rome. A production of such merit naturally attracted a good deal of attention, and all the more so that up to that time no important piece of public statuary had been executed in Scotland by a native artist. The President of the Royal Scottish Academy (Sir W. Allan) was warm in his commendation; while the Board of Trustees for Manufactures, besides voting a prize of 50*l.* to the aspiring artist, granted the use of their rooms at the Royal Institution for the exhibition of the group. Visitors flocked in, and general admiration was expressed, not merely by the public, but by brother artists, more than one of whom paid the sculptor the compliment of drawing from his

design. Small copies in bronze were made for several noblemen and gentlemen specially interested in the work; nor were there wanting proposals to have it reproduced in some enduring material as an ornament for the city. This project fell into abeyance at the time, to be, however, renewed about eighteen months ago, when a subscription was started with the view of having it carried into effect. As the result, sufficient funds have already been realised to warrant the casting of the group, and no doubt is entertained that what is further necessary for its public erection will be duly forthcoming. The design, it may be worth while to recapitulate, deals with the incident of the taming, by the young Prince of Macedonia, of the high-mettled steed, whose spirit had previously defied all control. The horse is represented as in the act of rearing, its figure being finely poised on the hind legs, and the fore feet thrown freely into the air. On the near side stands Alexander, whose head has been modelled from a bust in some Florentine gallery. He is firmly planted on his limbs, of which the right is advanced; and while, his right hand, drawn back with strong muscular action, reins in the fiery animal, and his left soothingly pats its shoulder, he coolly watches its excited eyes, as if to ascertain the effect of his treatment. A loose garment, shuffled off from his shoulder by the energetic movement of the right arm, still droops in graceful folds over the left side, and falls in a voluminous mass under the horse's hindquarters. The artist's motive, of displaying the predominance of intelligence over brute force has been happily carried out, alike in the expression of the individual figures and in the general effect of a design whose style shows how deeply the sculptor at the time of its production was preoccupied with classical models.

With a view to convenience of casting, the group was divided into several portions, those dealt with on the occasion being the human figure from the bust downwards, and the horse in two pieces, the forequarters being, however, without the legs. The moulds, made, as usual, of a mixture of stucco and brick-dust, were buried in the casting pit, the only part left visible being the necks through which the molten metal was to be poured. Previous to the arrival of the visitors the metal required had been melted, its composition being that generally adopted by Sir John Steell, of nine parts of copper to one of tin. At the appointed hour the furnace was ready for tapping, and the molten bronze, having received the addition of a little glass, intended to toughen and so render more manageable the slag floating on its surface, was run out into the casting-pots, the largest of which had to be swung about by means of a crane. Under Sir John Steell's personal superintendence, and the active direction of his experienced foreman, the filling of the moulds was deftly managed; the most notable feature of the operation, so far as the spectators were concerned, being, perhaps, the peculiar gurgling sound produced by the escaping air. To all appearance, the castings were most successfully accomplished, though, of course, some days must elapse before the cooling of the metal will admit of the exact results being ascertained. On the completion of the work Mr. Campbell Swinton proposed that the company accord their thanks to Sir John Steell, while expressing hearty good wishes for the success of his undertaking. The suggestion was cordially responded to, and Sir John briefly acknowledged the compliment. In addition to the castings made on this occasion, there only remain to be executed those of Alexander's head and arms and the fore legs of Bucephalus, in order to complete the group, which will stand some 10 feet high to the horse's ears. The artist is of opinion that to be seen to the best advantage the work should be raised about 10 feet from the ground. It is hoped that a site may be obtained at the west side of the St. Andrew Square enclosure, where the group could be so placed as to look along George Street, and afford a profile view towards North and South St. David Street.

Besides this work, Sir John Steell has now on hand commissions for two Burns statues—one to be placed on the Thames Embankment, London; the other for Dunedin, New Zealand. The design made for the Central Park, New York, and of which a duplicate may be seen in Dundee, will, we understand, be followed in its main features, but with some variation of treatment in matters of detail.

"ART, WEALTH, AND RICHES."

AN address was delivered by Mr. William Morrison in Manchester, on Tuesday evening, upon "Art, Wealth, and Riches." He said that some of them might consider the two words "wealth" and "riches" employed in the title of his address were tautologous, but he could not admit it. The truth was, there were no real synonyms in any language, unless in the case of words borrowed from another tongue; and in the early days of our own language no one would have thought of using the word "rich" as a synonym for "wealthy." He desired to use the words somewhat in the way our forefathers did, and thus understood they were; to his mind, widely different. The question, "Which shall art belong to, wealth or riches—whose servant shall she be? or rather, shall she be the slave of riches or the friend and helpmate of wealth?" was an important one. Indeed, if he put the question in another

form and asked, was art to be limited to a narrow class who only cared for it in a languid way, or was it to be the solace and pleasure of the whole people, the question finally came to this—were we to have art or the pretence of art? It was like enough that to many, or even most, of his hearers the question would seem of no practical importance, as to most people the present condition of art did seem in the main to be the only condition it could exist in among cultivated people, and they were (in a languid way) content with its present aims and tendencies. For himself, he was so discontented with the present condition of art, and the matter seemed so serious, that he was forced to try and make other people share his discontent. He would ask those who thought art was in a normal and healthy condition to explain the meaning of the enthusiasm shown of late years (which he was glad to learn the people of Manchester shared) for the foundation and extension of museums, a great part of whose contents were fragments of the household goods of past ages. Why did cultivated, sober, reasonable people, not lacking in a due sense of the value of money, give large sums for scraps of figured cloth, pieces of roughly-made pottery, worm-eaten carving, or battered metal-work, and treasure them up in expensive public buildings under the official guardianship of learned experts? We all knew that these things were educational and supposed to teach us something, and it was universally admitted that the study of these remains of past ages was indispensable to men who intended making their living by the art of design. Thus it came about that it was not to the best works of our own time that a student was sent—no master or expert could honestly tell him that that would do him good—but to the mere wreckage of bygone art: things which when they were new could be bought, for the most part, in every shop and market-place. Need one ask what sort of a figure the wreckage of our ornamental art would cut in a museum of the twenty-fourth century? The plain truth was that people who had studied these matters knew that the remnants of the past gave tokens of an art which fashioned goods better than we did now, but different in kind, and better because they were different in kind, and were made in quite other ways than we make such things. In those days art was, at all events, the helpmate of wealth and not the slave of riches, and everything which was made by man's hand was more or less beautiful. Contrast that with the state of art in the present day, and let them say if his discontent was not somewhat justified. So far from everything that was made by man being beautiful, almost all ordinary wares that were made by civilised man were shabbily and pretentiously ugly—made, so it would almost seem, by perverse intent rather than by accident, when we considered how pleasant and attractive to the inventive mind and the skilful hand were many of the processes of manufacture. All manufactured goods now were divided into two classes—one class vulgar and ugly, though often pretentious enough, with work on it which it was a mockery to call ornamental, but which probably had some wretched remains of tradition still clinging to it. That was for the poor people, the uncultivated. The other class, made for some of the rich, intended to be beautiful, was carefully and elaborately designed, but usually failed of its intent partly because it was cast loose from tradition, partly because there was no co-operation in it between the designer and the handicraftsman. Thus was our wealth injured—our wealth, the means of living a decent life—and no one was the gainer; for while on the one hand the lower classes had no real art of any kind about their houses, and had instead to put up with shabby and ghastly pretences of it, which quite destroyed their capacity for appreciating real art when they came across it in galleries and museums; so, on the other hand, not all the superfluous money of the rich could buy what they professed to want. The only real art they could have was that produced by unassisted individual genius, the laborious and painful work of men of rare attainments and special culture, who, numbered as they were by unromantic life and hideous surrounding, did in spite of all manage now and then to break through the hindrances and produce noble works of art, which only a very few people could pretend to understand or be moved by. If they thought he exaggerated, let him ask them to note how it fared with that art which was above all others co-operative—the art of architecture. No one knew better than he did the vast amount of talent and knowledge there was amongst the first-rate designers of buildings nowadays, and here and there all about the country one saw the buildings they had planned, and was rejoiced by them. Yet that helped a man little enough when, if he left England for a few years, he found on coming back half a county of bricks and mortar added to London, and could the greatest optimist say that the style of building in that half county had improved? Was it not true that, on the contrary, it went on getting worse, if that were possible, the last houses built being always the vulgarest and ugliest? Anyone who had seen Rouen or Oxford thirty years ago would see the contrast in our present way of housing ourselves. He had lately been to Bournemouth, which was a district (not a town) of rich men's houses, who had every inducement to make them beautiful, for the place with its sandy hills and pine trees gave really a remarkable site—it would not have taken so very much to make it romantic. There stood these rich men's houses among the pine trees and gardens, and not even the pine trees and gardens could make them tolerable.

They were simply blackguardly—they must pardon the word—and even as he spoke they were going on building them by the mile. Why could they not amend all that? Why could they not have simple and beautiful dwellings fit for cultivated, well-mannered men and women and not for ignorant, purse-proud machines? They might say because they did not wish for them, and that was true enough; but that only removed the question a step further, and they must ask why did they not care about art? Why had civilised society in all that related to the beauty of man's handiwork degenerated from the time of the barbarous, superstitious, unpeaceful middle ages? He said unhesitatingly that the intelligent work which produced real art was pleasant to do; was human work not over-burdensome or degrading, whereas the unintelligent work which produced sham art was irksome to do; it was inhuman work, burdensome and degrading, so that it was but right and proper that it should turn out nothing but ugly things. The immediate cause of that degrading labour which oppressed so large a part of the people was the system of the organisation of labour which was the chief instrument of the great power of modern Europe—competitive commerce.

BLYTHBURGH CHURCH.

THE following letters from the Secretary of the Society for the Protection of Ancient Buildings and from the Rev. H. Sykes, the vicar, concerning Blythburgh Church, suggest the differences between the advocates and the opponents of restoration:—

I.

The Society's Theory.

The committee for the restoration of Blythburgh Church appeals to all lovers of the grand and beautiful in architecture to help in raising funds for the preservation of this noble edifice from the ruin which is imminent. The Society for the Protection of Ancient Buildings was not slow to offer its assistance. A careful survey was made and a report sent to the building committee. This report described with great minuteness every source of present danger to the fabric, and the best means for repairing and checking decay. The recommendations of the report were all founded on a long experience in dealing with ancient buildings, and were in the strictest sense practical. The cost of the repairs as estimated by the Society would amount to 2,000*l.*, or perhaps 3,000*l.* These recommendations were in all too moderate for the committee, whose professed intention was but the preservation of the building from ruin. At least 5,000*l.* would be required under the plan that has been adopted, and as Mr. Street said to the vicar, "There is no limit to what may be spent on such a church" if the kind of expense he proposed were indulged in. Mr. Street's proposals were of the stereotyped sort, familiar to all who have known anything of restoration for the last twenty years. New windows, new roofs, new plaster on the walls, the more or less complete renewal and entire modernising of the church; for such treatment is modernisation, call it by what other name you will. Take for example the windows: the mullions and greater part of the tracery will be taken out and new stone work substituted, the new being in sort a copy of the old, but still new in material and workmanship. How much loss of refinement and beauty this change alone will bring, only those who can distinguish modern work from ancient are competent to say. Between fifteenth-century stone cutting and that of to-day the difference, as works of art, is infinite, and with this difference, the preservation in copying of traceries so refined as those of Blythburgh is an impossibility. We are aware that Mr. Street did not agree with the Society in this opinion, that he thought stone cutting below the rank of carving, a mechanical art, and as well done now as ever. Unfortunately as respects modern stone cutting, he had but too much reason for thinking it mechanical. As regards ancient work, he was obviously and strangely wrong. You have but to look at the windows of Blythburgh Church to be convinced of this, if you can look with eyes sensitive to delicacies of curvature and accustomed to comparison of size and shape. These windows have no geometrical exactness, nor any uniformity, though all are made from one or two designs.

The first appeal of the restoration committee is for 1,049*l.* 10*s.* 6*d.*, to be partly spent in the destruction and renewal of the windows which, under a more protective treatment, might remain with their glass and ironwork for the pleasure and instruction of those who really love what is beautiful in architecture for 200 years to come. How this might be done the report of the Society carefully described, and the vicar acknowledges "that its object being the protection of ancient work, the proposals of the Society were just what might have been expected," though "they run counter to his ideas of restoration." This is quite true. They are contrary to all ideas of restoration, they are conceived purely in the spirit of preservation, the purpose which the committee professes to have in view.

As a miserable consequence of the removal of the ancient stone-work of these windows, the old glass will also be sacrificed.

This is of three kinds. There are in all the windows some remains of the original glazing, beautiful stained and painted glass, the leading of which is in a very tender condition, needing the greatest delicacy in handling, but nevertheless capable of repair without disturbance. This old glass will be taken out, and what is not lost will be cleaned, re-leaded, and perhaps, re-arranged. There are here and there, but chiefly in the clerestory, remains of the old quarry glazing, the glass being of very beautiful tint and quality; and there is the later glazing of poorer glass comparatively, but still of much better kind than church restorers are in the habit of using—ininitely better than the so-called "Cathedral glass" prescribed in Mr. Street's specification. This "Cathedral glass," it may be explained to the uninitiated, has no right to the name, other than what a prudent inventor had in his power to give to his own production. It is the most offensive and vulgar of all known glazing materials. It is unlike ancient glass in all essentials of beauty, but it is nevertheless the chosen material with those who presume to "restore" our ancient buildings. With this and such like vulgarities we are asked to replace the beautiful architecture of Blythburgh, and to make this noble church "again fit for the worship of Almighty God."

In the last 200 years this church, as finally left by the Reformation, has not been thought by bishop or clergy or congregation unfitted for its holy purpose, and it has not yet lost the sanctity of ancient origin, and of a beauty almost like that of nature. The new modernised church which will come out of this restoration will appeal only to a temporary fancy, and to undiscerning tastes. The Society would gladly save this noble building from a fate which has befallen so many of the most precious monuments of ancient art, but it has failed so often it almost despairs of being able to impress those responsible for the preservation with the real nature of the duty that lies before them. It remains for the subscribers to say whether the funds they contribute shall be spent in the preservation of the church, or in the delusion and mischievous pretence of restoration.

II.

The Vicar's reply to the Society.

Dear Sir,—In answer to your inquiries respecting Blythburgh Church, I have to inform you that the portion of work to be first undertaken is from the plans and specifications of Mr. Street, a copy of which, I believe, your Society possesses. You will also find it specified at the head of the slip accompanying the enclosed circular. Your Society's report was carefully perused by every member of the building committee, and all felt how deeply we were indebted to your Society for the kindly interest taken in our church and its preservation, so clearly indicated in the very elaborate and carefully drawn up report you have presented.

From a purely theoretical point of view your proposals are undoubtedly admirable, but, practically, we regret to say they are simply inadmissible. Take, for example, your proposed treatment of the windows. As the object of your Society is the protection of ancient work, your proposals are just what we might expect them to be; but you will not be surprised to find that they run counter to our ideas of restoration.

Again, we consider the church has been disfigured long enough by "transomes" and "bricked-up windows," and I am sure it would be most repugnant to the feelings of the parishioners and to the notions of the general public to see the fine old church further disfigured with such unsightly makeshifts. Were your scheme carried out, the ultimate result would be that every window must be walled up, and the building rendered useless as a place of worship. Our object in restoration is to preserve this noble edifice from the ruin which is imminent, and to make it again fit and becoming for the worship of Almighty God—an object compared with which purely scientific fancies must sink into insignificance.

I cannot think that many members of your Society would like such a scheme as you propose to be applied to a place of worship they attend. Let them bring the matter home, and ask themselves if they could bear to see their church or chapel disfigured with unsightly "transomes" and "bricked-up windows," and adorned with "posts" and "curtains" such as you suggest.

From some expressions used in your report you evidently anticipate that your proposals will not coincide with our notions of restoration, and you will quite understand that we should not feel justified in appealing to the county for funds to carry out such a scheme as you propose. Could your Society guarantee the money necessary for such a purpose, then it might be a question whether it would not be wise on the part of our committee to place the business in your hands, and apply themselves to raising funds for a chapel-of-ease. Till some proposition of this kind be made to us we feel we must adhere to the course recommended by our architect, and trust that a liberal response will be made to our appeal from every part of the county; and to the list of subscriptions already published we shall be happy to add a donation, however small, from the "Society for the Restoration of Ancient Buildings."

With many thanks for the interest your Society has taken in our proceedings, I remain,

Yours most respectfully,
Thos. Wise, Esq., Secretary, &c. H. SYKES.

The Decoration of St. Paul's.

SIR,—My "strong language" has, in a measure, had the effect intended. It has provoked "A London Artist" and "A London Architect" to state what I suppose they consider good reasons why the proposed decoration of the dome of St. Paul's should be carried out. Now what are these reasons? The "Artist's" reasons are that Sir Frederick Leighton and Mr. Poynter, being men gifted with common sense, know what they are about, and think the right thing to do is to carry out the decoration on the basis of Stevens' design. The "Artist" has no other reason. All that the "Architect" has to advance is, that Sir Christopher Wren and Mr. Cockerell both thought that the dome should be "filled with bright mosaics." That, of course, is no reason why the mosaics should take the form of an elaborate composition, which, if intelligible at all, must be dependent on expression as well as on form. We have, I think, every reason to believe that Wren was gifted with more ordinary common sense than to dream of such an absurdity. There can be no objection to the use of mosaics in the decoration of the dome; but the question at issue is this—Is it not wasteful and folly to fix up there artistic work which cannot possibly be appreciated, and can only be dimly seen from the floor of the cathedral? If Sir Frederick Leighton and Mr. Poynter say that is *not* folly, I shall hold my own opinion notwithstanding, and I shall still appeal to the most ordinary common sense in support of it. Do either of your correspondents mean to say that it will be possible to make out the delicate forms and shades of expression which pervade the cartoon—to which reference has been made—from the floor of the church? Will they be so good as answer that question—yea or nay? Everything depends upon that, or rather, I should say, nearly everything, for another point must be considered. If the decoration of the walls is ever completed, the building will be *darker* than at present, and unless the windows are to be left with clear glass only, without tint, the darkness must inevitably be greatly increased.

I am unwilling to close without making another remark about the subject of the cartoon. The "Artist" passes over my allusion to it with an unwarrantable sneer; the "Architect" seeks precedent for the design in the Sistine Chapel. Innumerable precedents can be referred to, but there is this vast difference between, say, the artist who decorated the walls of the Campo Santo and the artist who is about to decorate the dome of St. Paul's, that the one believed religiously in the literal truth of what he represented, as did also his contemporaries, whereas the other has no such faith. It is indeed simply incredible that *any* man in this year of grace, however orthodox, should believe that resurrection will be a *gradual* process—that the dead shall arise from the sea still dead, while friends who have got a slight start shall recognise others' still half-clothed skeletons, and watch the development of bone and tissue, and all the various attributes of mortal flesh. Is it not well to protest against materialism so gross and false—such a ghastly travesty of Scripture teaching and cotemporary belief?

Your obedient servant,

March 3, 1883.

A COUNTRY ARCHITECT.

SIR,—The "Country Architect" expressed the opinions of a great many London architects when he objected to the design for the decoration of St. Paul's, which was lately published. While everyone is willing to admit the grace and power of Sir Frederick Leighton's cartoon, when considered simply as a group of figures, there is at the same time a regret that some other subject had not been selected by him or by the Decoration Committee. A correspondent last week refers to the Greek admiration for the human form, but would the Greeks have represented men and women under such circumstances as those which are introduced in the cartoon? They might have admired the modelling of Sir Frederick Leighton's figures, but they would be puzzled to explain why the functions of art should be ignored, in order to express a theological doctrine which is so much beyond experience that words cannot explain its conditions. Art, like poetry, has abandoned its office when it ceases to give pleasure, and can anyone enjoy scenes which recall the horrors of the charnel-house? If the victory over death is to be represented by art, it can only be in some way that will correspond with the vision of Milton, which is classic in spirit without ceasing to be Christian:—

Methought I saw my late espoused saint
Brought to me, like Alcestis, from the grave,
Whom Jove's great son to her glad husband gave.

Her face was veil'd; yet to my fancied sight
Love, sweetness, goodness, in her person shin'd
So clear, as in no face with more delight.

In these lines everything that is unpleasant is passed over, and, in consequence, the sonnet becomes a work of art. Let painters follow the same principle when decorating St. Paul's, if they wish to gain general admiration for their works.

The "London Artist" who wrote last week, like a good many designers and decorators, is sarcastic about the omniscience of architects when colour and decoration are discussed. The truth is that architects are more likely to take a broad view of those subjects, and consider them in their relations to other things. If I may judge from my own experience, decorative artists think of nothing but their individual work. The project for the decoration of St. Paul's is a case in point. Why should the dome be filled with paintings or mosaics when there is no scheme for the decoration of the remainder of the building? Mr. Burges thought out the decoration as a whole—every architect on principle would do so—but painters and amateur painters seem to be incompetent to realise that when the dome is alone considered, and is adorned as if it were a detached structure, it may be hereafter most difficult to bring the rest of the building into harmony with the colours which are used there. It is impossible to carry out proper decoration bit by bit, and it is not unlikely that, in course of time, if money is forthcoming, St. Paul's may resemble one of those churches (unfortunately there are a great many of them in England) wherein we find modern memorial windows, each of which seems by its style to be endeavouring to attract the largest amount of attention to itself.

This piecemeal style of operating on a great building has not the sanction of Wren, and it is absurd to introduce his name as if the Decoration Committee and their artists were loyally endeavouring to realise his intentions. When the cathedral was approaching completion, Wren was badgered by the officialdom of those days, and he was not able to prepare a complete scheme of decoration. But it is plain that his thoughts were not concentrated on his dome. Thus in one passage of the "Parentalia" we read:—"The painting and gilding of the architecture of the east end of the church over the communion table was intended only to serve the present occasion, till such time as materials could have been procured for a magnificent altar-piece, consisting of four pillars, wreathed of the richest Greek marbles, &c., for which the respective drawings and a model were prepared. Information and particular descriptions of certain blocks of marble were once sent to the Right Rev. Dr. Compton, Bishop of London, from a Levantine merchant in Holland, and communicated to the surveyor; but, unluckily, the colours and scantlings did not answer his [that is Wren's] purpose. So it rested in expectation of a fitter opportunity, else probably this curious and stately design had been finished at the same time with the main fabric." It is evident from this, in the first place, that Wren, unlike the modern Committee, considered the east end of the cathedral to be of the first importance; and, secondly, his fastidiousness in selecting coloured marbles indicates that he was aware of the need of consistency in such a building, and that the relations of the parts to the whole cannot be disregarded. Thornhill, like his successors, was of a different way of thinking. Wren, however, repudiated all responsibility for the figures. "The directing of the paintings of cupola," he wrote, "has been taken out of my hands, and therefore I hope I am not responsible for them." What Wren desired was another mode of decoration. In a print which was engraved under his authority, "figures are shown in the spandrels of the dome somewhat as in the pendentives of St. Peter's, but much smaller," a very different arrangement from what is proposed to be now adopted. Wren's intentions are further seen in the decoration of the cupolas of the nave. The print shows coffered "with figures in the spandrels in due subordination to the architecture." "Due subordination to the architecture"—that is the principle which should govern all decoration of buildings, however obnoxious it may be to the "London Artist" and his friends.

The late Professor Cockerell's name has been also cited by one of your correspondents to give authority to the Committee's scheme, but nothing can be more unwarranted. Cockerell was too true an artist to sanction any fractional decoration, or to believe that the cupola offered the best opportunities for figure painting. In his report of 1849 he proposed, as regards the dome, nothing more than the restoration of the existing painting and gilding. The style of the figures, he said, was not now approved, but "it is highly decorative and appropriate to the architecture, and is too far removed from the eye to challenge minute criticism." The truth of the last words is unquestionable. Few people have studied Thornhill's figures, and I fear that, when their novelty ceases to be attractive, as few will care to give attention to those by the President and Mr. Poynter. Professor Cockerell considered that the money could be better spent than on delicate figures for the dome. He recommended the adornment of the east end with "all the becoming ornaments to the gates, the pulpit, the stalls, the organ, the communion rail and table, &c., and especially" the reglazing of the whole of the twenty-three lower windows on the floor of the cathedral with Scripture subjects in coloured glass. The windows offered, he said, the first grand opportunity since the Reformation of illustrating the unadulterated word of God. "Such a mode of description," he continued, "is at once the most conformable to Christian and ancient associations, and the most economical that could be devised, at the same time that it is the most splendid; since, as the vehicle of light, it transmits all that effect and lustre to the interior which mural decoration fails to effect in the same degree, and which, in fact, it supersedes."

There is not a word of Professor Cockerell's which admits of

being interpreted as an approval of what is at the present time under consideration, and no man was more scrupulous in studying Wren's intentions. It is, therefore, hardly honest to say that either Wren or Cockerell believed that the interior surface of the dome ought to be covered with an intricate series of figure subjects. In fact, there is no authority for the scheme of the Committee, by which one part of Wren's cathedral is to be transformed; and, much as one admires the genius of the President, it must, I think, be admitted that he has undertaken a subject which is not adapted for representation.

Your obedient servant,
F. S. A.

LEGAL.

Queen's Bench Division.—March 6.

(Before Mr. Baron POLLOCK, Mr. Baron HUDDLESTON, and Mr. Justice NORTH.)

MOORE v. SHAW.

THE EMPLOYERS' LIABILITY ACT.

This was a case which raised a somewhat nice point under the recent Employers' Liability Act. It was an action tried in the Westminster County Court under Lord Campbell's Act by the representatives of a man named Moore, who had met his death while in the service of the defendant Shaw; and the defendant, it was said, had made himself liable under Section 1 of the Employers' Liability Act, which entitles a workman to recover where he has suffered injury by reason of a defect in the plant, &c., or by reason of the negligence of a person employed by his master as a superintendent. The facts of the case were that the defendant was under a contract for rebuilding the Oratory at Brompton, and that one day in June last, while Moore was employed on the scaffolding of the roof, he was sent for by the foreman, who was also on the roof, to screw up some trusses which required tightening. It seemed that there was a staging supported by putlogs, and that this staging being in process of removal one of the putlogs had become exposed. It was, moreover, loose, and Moore stepping upon it it gave way, and he was precipitated to the bottom of the building, a fall of 70 feet, thereby meeting with his death. The learned Judge who tried the case left it to the jury to say whether, having regard to the purpose for which it was used, it was negligence to leave the putlog untied, and the jury finding that it was, and that the putlog unfastened was a dangerous thing, gave a verdict for the plaintiff, with 270*l.* damages. A rule having been obtained for a new trial on a variety of grounds, including misdirection, the case was now argued.

After considerable argument the Court, with reluctance, came to the conclusion that there should be a new trial, on the ground that the proper question had not been left to the jury.

Mr. Baron Pollock said the point had been taken at the trial that the deceased knew perfectly well that putlogs were not meant to be stepped upon, but were intended as supports for the staging. The jury therefore ought to have been asked whether the deceased, when he stepped upon the putlog, was using it in a reasonable and proper manner, for it was one thing to use a putlog for the purpose for which it was intended, and another to use it as the deceased had used it; and he was prepared to hold that "defect," to be within the Act, must be a defect having regard to the purpose for which the plant was intended.

Mr. Baron Huddleston concurred. It was open to the deceased to have stepped over the staging or on to the putlog. He chose the latter, and the question, therefore, for the jury should have been whether, taking all the circumstances, it was reasonable for him to have stepped on to the putlog.

Mr. Justice North concurred.

NEW BUILDINGS.

Durham.—Premises at the foot of Crossgate are in course of re-erection for Mr. J. G. Rollin, chemist, from designs by Mr. H. T. Graddon, architect, of Durham. The new buildings consist of two shops, with cellars under; and in the rear, staircase leading to rooms above, which are to be occupied as a dwelling-house. This house consists of four rooms, with pantry, &c. The whole of the works are expected to cost about 600*l.*, and will be completed in the course of a month or two.

GENERAL.

Mr. Willis, of the Training School, South Kensington, has been selected for the Art Mastership of the Manchester School.

Plans by Mr. J. D. Webster have been adopted for proposed additions to the General Infirmary at Sheffield.

Mr. A. W. Kershaw, of Lancaster, has just issued a sheet of designs of a new ventilator, which seems to be well adapted to the purpose for which it is intended.

Mr. H. Hardwick, borough surveyor of Longton, has been elected to the office of borough surveyor for Walsall.

The Plans of Mr. T'Anson have been chosen for the new Corn Exchange at Colchester.

An Exhibition of Paintings and Water-Colour Drawings will be opened in York on June 6.

A Pastoral Staff, which was designed by Mr. A. W. Blomfield, was presented to the Bishop of Lichfield on the 2nd inst.

A Layman has offered 1,000*l.* towards the completion of St. Matthew's Church, Newcastle-on-Tyne, on which there is a debt of about 1,500*l.*

The Kidderminster Board of Guardians have adopted the plans revised by Mr. Watkins, architect, for the extension of the workhouse.

Mr. John Johnstone has been awarded the first premium of 200*l.* in the competition for the Madeira Road Improvement scheme, Brighton.

A Reredos, designed by Mr. J. D. Sedding, and executed by Mr. G. W. Seale of Brixton, has been erected in the church of St. Clement at Bournemouth.

Mr. J. W. Small read a paper on "Furniture, Design, and Manufacture" at the meeting of the Edinburgh Architectural Association on Wednesday.

The Birkenhead Town Council, on Wednesday, decided to invite tenders for the erection of the new Town Hall, in accordance with the plans of Mr. C. O. Ellison.

Mr. Pearson's Plans have been adopted for the restoration of the south transept and west end of the nave of St. Nicholas' Church, Great Yarmouth. The work will cost about 2,500*l.*

The Helensburgh Police Commission have deputed Provost Stuart and Messrs. Logan & Greenlees to visit, along with Mr. Honeyman, architect, various public halls in the neighbourhood of Glasgow, in view of the proposed erection of a Town Hall for Helensburgh.

The Stelli Trustees will not erect the statue of Sir William Wallace on the proposed site in Duthie Park, Aberdeen, unless the Town Council consent to forego their rights of letting the ground in the immediate vicinity for building purposes, as it is thought that the amenity of the statue would be destroyed by the erection of buildings.

The Plans prepared for the North-Eastern County School at Barnard Castle were considered at the last meeting of the Governors. It was resolved that the whole of the plans be at once referred to the several architects, with an intimation that the sum to be expended on the buildings must not by any means exceed 15,000*l.*, an amount rather over the sum originally fixed.

Mr. J. O. Halliwell Phillips has offered to superintend and pay the cost of the reproduction of the Corporation records of Stratford-on-Avon. They date almost from the time of the Conquest, and are of great historical and Shaksperian interest. Mr. Halliwell Phillips stipulates that the Council should, when the copies are delivered into their hands, arrange for their sale at Stratford, the proceeds to be placed at the disposal of the Corporation. The offer has been accepted by the Town Council.

Mr. George Wythes, the contractor, died on Saturday last, in the seventy-second year of his age. He was engaged in railway contracts with the late Mr. Brassey and others, and he constructed a portion of the Great Indian Peninsular Railway. He was in partnership with Messrs. Jackson and Brassey and others in several railways, and various contracts of great public benefit. Mr. Wythes built the parish church of Bickley and the adjoining parsonage in the park entirely at his own expense, at a cost of upwards of 20,000*l.*

Mr. W. Money, F.S.A., has presented the Newbury Corporation with a series of Royal Charters which had been alienated from the possession of the borough authorities for nearly a century, having lain unheeded among the muniments of the Townsend family, whose representative, Mr. Stephen Hemsted, jun., J.P., of Newbury, now restores them to the town. The documents include the original Incorporation Charter of Queen Elizabeth, and several charters granted in the reigns of Charles I., Charles II., and James II., also a terrier of lands belonging to the Crown at Newbury in 1561, and other manuscripts. Most of the charters are in an excellent state of preservation.

The London School Board.—At the meeting of the School Board on the 2nd inst., Mr. Lee Roberts called attention to the present cost and working of the architect's department, and moved a resolution declaring it desirable to put an end to the present arrangements with Mr. Robson and Mr. Young, and to secure the entire services of the requisite staff of the department at fixed inclusive salaries.—Mr. Bourke seconded the proposition.—Sir Edmund Currie, chairman of the Works Committee, testified to the value and importance of the services rendered to the Board by Mr. Robson during the past ten years, and questioned whether the Board could make any better terms than those which had been adopted. His opinion was that no architect worth his salt would give up his whole time to the Board.—The discussion of the subject was adjourned.

SUPPLEMENT

TO THE

ARCHITECT

CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MARCH 10, 1883.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

*Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—
"Contract Supplement to THE ARCHITECT."*

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

APPOINTMENT VACANT.

SOLIHULL.—Mar. 10.—Applications are required for the appointment of a Surveyor to the Rural Sanitary Authority. Salary, £150 per annum. Mr. F. L. Thompson, Clerk to the Authority, Bank Buildings, Solihull.

COMPETITIONS OPEN.

MORLEY.—Mar. 20.—Plans are required for new Wesleyan Sunday Schools. Rev. Wm. Griffiths, Wesley House, Morley.

NOTTINGHAM.—Mar. 15.—Plans, Designs, and Estimates are invited by the Corporation for the Erection of Municipal Offices. Premiums to the extent of 600l. offered. Mr. S. G. Johnson, Town Clerk, Municipal Offices, Nottingham.

RIPLEY.—Mar. 30.—Plans are required for the proposed Erection of Two Schools at Lower Hartsbray and Waingroves. Mr. Jno. T. Capon, Clerk to the School Board, Market House Chambers, Ripley.

CONTRACTS OPEN.

ALLOA.—Mar. 10.—For Alterations and Additions to Public School. Messrs. John Melvin & Son, Architects, Mar Street, Alloa.

AYR.—Mar. 16.—For Erection of Workshops, Timber Gangways, &c., at Slip Dock. Mr. John Strain, C.E., 154 West George Street, Glasgow.

BARNSELY.—Mar. 14.—For Building Warehouses, Workshops, Show-rooms, Stabling, &c., Market Street. Mr. Charles S. Milner, Architect, 9 Regent Street, Barnsley.

BETHESDA.—Mar. 10.—For Construction of an Intake, Screening Chamber, Straining House, Service Reservoir, &c., Providing and Laying Cast-iron Water Mains, &c. Mr. James Mansergh, Engineer, 3 Westminster Chambers, Victoria Street, Westminster.

BIRKENHEAD.—Mar. 16.—For Construction of Retort House, 200 feet by 70 feet, and Two Chimney Stacks, 70 feet high. Mr. T. O. Paterson, Gas Engineer, Gasworks, Birkenhead.

BLACKBURN.—Mar. 12.—For Building Wing to Infirmary. Mr. A. W. R. Simpson, Architect, Richmond Chambers, Blackburn.

BRACEBRIDGE.—Mar. 24.—For Execution of Sewerage Works (Contract No. 1). Mr. J. Mansergh, Engineer, 3 Westminster Chambers, Victoria Street, Westminster.

BRADFORD.—Mar. 12.—For Erection of Mill Chimney in Frederick Street. Messrs. G. Buckley & Son, Architects, Waterhouse Street, Halifax.

BRANDON PARVA.—Mar. 10.—For Building Schoolhouse. Mr. John B. Pearce, Architect, Surrey Street Norwich.

BRIERFIELD.—Mar. 15.—For Building Three Dwelling Houses, Halifax Road. Mr. Thomas Bell, Architect, Burnley.

BURNLEY.—Mar. 14.—For Building Four Blocks of Cottage Homes, Rakehead. Mr. T. Bell, Architect, Burnley.

BURNSALL.—Mar. 12.—For Rebuilding Bridge over the River Wharfe. Mr. J. Vickers Edwards, West Riding Bridge, Surveyor, Wakefield.

BURTON-ON-TRENT.—Mar. 14.—For Erection of Minister's House. Rev. H. Peach, Moor Street, Burton.

CARDIFF.—Mar. 19.—For Painting and Repairs to Town Hall. Mr. J. A. B. Williams, Borough Engineer, Cardiff.

CARDIFF.—For Erection of a Coach-building Factory. Mr. W. McDonald, 72 Crockherbtown, Cardiff.

CARLISLE.—Mar. 10.—For Building Sunday Schools, West Tower Street. Mr. George Dale Oliver, Architect, Bank Chambers, Carlisle.

CARLISLE.—Mar. 12.—For Building St. James's Mission Hall and Cafetaker's House. Mr. James Murchie, Architect, Lowther Street, Carlisle.

CLAYTON-LE-MOORS.—Mar. 13.—For Building Pair of Semi-detached Houses. Mr. George Baines, Architect, Post Office Chambers, Accrington.

CLAYTON.—Mar. 13.—For Alterations and Additions to Northern District Boys' School, St. John's Common. Mr. E. J. Hamilton, Architect, 10 Prince Albert Street, Brighton.

DEWSBURY.—Mar. 16.—For Building Public Hall, Coffee-rooms, and other Premises. Mr. John Barton, Architect, St. Mark's, Dewsbury.

DIDCOT.—April 3.—For Construction of new Station, Plans, &c., at the Office of the Engineer, Paddington Station.

GREAT HARWOOD.—Mar. 17.—For Building Wesleyan Methodist Chapel. Messrs. Hopwood & Maxwell, Bank Chambers, Blackburn.

GRIMSBY.—Mar. 30.—For Building a Range of Offices at the Docks. Messrs. Mills & Murgatroyd, Architects, 23 Strutt Street, Manchester.

GOOLE.—Mar. 13.—For Heating by Hot Water or Hot Air Suites of Offices and Shops, for the Market Hall Company. Mr. William Watson, Architect, Barstow Square, Wakefield.

HASTINGS.—Mar. 12.—For Enlargement of Silverhill Board Schools. Messrs. Elworthy & Son, Architects, London Road, St. Leonard's-on-Sea.

HAVANT.—Mar. 24.—For small Additions and Alterations to County Police Station. Mr. James Robinson, County Surveyor, County Hall, Winchester.

HEBBURN.—Mar. 10.—For Erection of Offices, Sheds, Workshops, &c., for a Shipbuilding Yard. Mr. Hubert Laws, C.E., 18 Grainger Street West, Newcastle-on-Tyne.

HEBBURN.—Mar. 10.—For Building Vicarage House for St. Oswald's. Rev. P. W. Clarke, 2 Croft Terrace, Jarrow.

HELSTON.—Mar. 10.—For Restoration of St. Michael's Church. Mr. J. Piers St. Aubyn, Architect, Temple, E.C.

HIRWAIN.—Mar. 24.—For Extension and Restoration of Church. Mr. E. M. E. Vaughan, Architect, 74 Crockherbtown, Cardiff.
